In consequence of these defects in the law, the health of several old and populous districts of the metropolis is affected, and very great inconvenience experienced, from the want or imperfect state of the sewage. The inhabitants of those districts are rated for sewage which either does not exist, or from which they derive very partial advantage. An unequal and unjust tax is imposed, and the dissatisfaction which it excites is aggravated by its being paid to irresponsible bodies. The Committee, indeed, express their satisfaction, that whatever may be the defects of the existing laws on the subject, they appear to have been administered with good faith and integrity on the part of the commissioners. No charge of malversation, it is said, in the management of the funds intrusted to them during late years has been substantiated; and where any just ground of complaint has arisen on the part of the public, it would appear to originate in the faults of the system, and in a consequent want of power in the commissioners. By the law of Henry VIII. the commissioners are allowed 4*s.* a day. This allowance has been generally dropped, but the commissioners of most of the trusts, in lieu of it, dine together on their quarterly days of meeting; the expenses of which are defrayed from the funds in their possession. The number of members of each commission is far too large—in the Westminster and part of Middlesex Board, they amount to upwards of two hundred. The act of Henry VIII. constitutes six a quorum; and in a statement given of the meetings of the Westminster Trust during 1833, the average attendance was about a dozen. The actual annual expenses of the establishment of this trust are as follows:—

Clerks, assistants, and messengers	£1045	0	0
Surveyor's salary	400	0	0
Clerks of works, and labourers	945	14	0
	£2390	14	0

The receipt and expenditure for the last ten years is exhibited in the following table:—

Year.	Receipt.	Expenditure.
1824	£29,981 16 11	£24,168 1 1
1825	28,837 10 10	24,360 4 1
1826	22,740 19 6	29,410 10 0
1827	28,375 17 11	23,505 17 10
1828	19,209 2 6	27,340 15 3
1829	39,424 1 10	33,998 13 9
1830	28,009 17 9	30,427 8 11
1831	35,394 19 7	23,643 0 11
1832	11,274 12 3	19,724 12 10
1833	37,546 3 2	33,410 3 7
	£280,795 2 3	
Balance carried to the account of 1833		10,805 14 0
		£280,795 2 3

This large receipt and expenditure has reference to the following parishes, either wholly or in part under the jurisdiction of the commissioners:—

St. Clement Danes	Wilsden (part)
St. Mary le Strand	St. Mary-le-bone
St. Paul, Covent Gardon	St. Mary, Paddington
St. John Baptist, Savoy	St. George, Hanover-square
St. Martin-in-the Fields	St. James, Westminster
St. Ann, Westminster	St. Margaret, Westminster
St. Giles in the Fields (part)	St. John the Evangelist, do.
St. George, Bloomsbury (part)	St. Luke, Chelsea
St. Pancras (part)	St. Mary Abbots, Kensington
St. John, Hampstead (part)	All Saints, Fulham (part)

There are other parishes named in the commission, but not included in the local act under which the Board administer. From a return, given in evidence by Mr. William Fowler, it appears that the quantity of feet of open and covered sewers built at the cost of the commission since 1807, is 9578, while, during the same period, the public, at their private cost, and without any assistance from the sewers' rate, built 91,708 feet.

Mr. Nathaniel Stallwood gave in the following statement in reference to the expenses of the Holborn and Finsbury Trust:—

Expenses charged by the Commissioners of the Holborn and Finsbury Trust during Twenty Years, from 1814 *to* 1833, *both inclusive.*

Tavern expenses	£7,935	0	0
Rent of offices, repairs, &c.	8,858	0	0
Petty cash to 1827	2,427	0	0
Stationery and printing	4,450	0	0
Furniture	264	0	0
Clerks and messengers	15,737	0	0
Surveyors and inspectors	14,928	0	0
Parliamentary expenses and law	4,315	0	0
Stamps and brokerage	486	0	0
Five per cent. to collectors	10,260	0	0
	£69,600	0	0

This statement is commented on by Messrs. Stable and Lush, the joint clerks of the Holborn and Finsbury Trust, and they explain many of the items which Mr. Stallwood had pointed out as being of a very questionable character. The sum charged for tavern expenses appears to be, on an average, 50*l.* yearly less than the original sum of 4*s.* a day allowed by the old law; while the expenses of superintendence, which Mr. Stallwood had averaged at 50 per cent. upon the money expended—144,375*l.*,—have to be extended not merely over the works executed at the cost of the Commission, but also over the works executed by private individuals under the sanction of the Board. The total amount expended in 1833 by this Trust on their works, was 7337*l.* 19*s.* 4*d.*; the entire amount expended, including salaries, and remuneration to individuals who had suffered damage, was 11,992*l.* 12*s.* 2*d.*

The commissioners of the city and liberties of London division have within their jurisdiction about 17,600 houses, the rental of which, assessed to the sewer-rate, is 792,904*l.* This comprehends, either wholly or in part, 113 parishes, of which the population is estimated at 122,316. The number of commissioners is 107; seven constitute a quorum; and the average number who attend the meetings is from twenty-five to thirty. The salaries of the officers only amount to 570*l.* per annum; and since the year 1756, about 114 new sewers have been built, wholly or in part. Very great improvements have taken place of late years in the management of this Trust; and the sewers are, generally speaking, in an unobjectionable state. Complaints have been made by several of the inhabitants, who have large and valuable properties in the most crowded parts of the city, of the want of drainage in their neighbourhoods—a deficiency which not only produces serious inconvenience, but has been prejudicial to health. But there are obstacles of considerable magnitude in the way of the necessary improvements. To construct sewers of sufficient depth to drain the properties in question, would endanger several buildings,—one or two of them ecclesiastical structures,—and produce considerable risk of loss and damage; and the commissioners have hitherto, in consequence of their defective powers, and misunderstanding with the individuals who complain, refrained from interfering.

The amount received and expended by the City of London division for the last ten years is as follows:—

Year.	Received.	Balance in hand, after defraying Expenses.
1824	£5,643 0 0	. . . . .
1825	7,500 19 10	. . . . .
1826	9,281 11 2	£77 13 10½
1827	12,430 7 5	701 18 5
1828	13,006 14 3	1199 13 3
1829	18,307 14 1	2787 18 7
1830	14,983 7 9	2822 13 7
1831	10,068 10 6	. . . . .
1832	12,041 5 11	. . . . .
1833	17,718 9 4	4379 1 11

It will be unnecessary to enter more into detail respecting the seven metropolitan sewage Trusts. These specimens indicate sufficiently the manner in which the different Commissions are administered, and point out the necessity which exists for an enlargement of the powers, a consolidation of the operations, and a due and efficient control over the actions of those who are invested with the care of the health

and cleanliness of the metropolis, and who, for the accomplishment of the purposes of their Trusts, have the power of levying an arbitrary tax upon the inhabitants. Notwithstanding the large sums which have been levied and expended, the state of the metropolitan sewage is very far indeed from accomplishing the objects proposed. Complaints from every quarter were forwarded to the Committee; and though these complaints were met by counter-statements which threw the onus off the different boards, in so far as a tolerably fair administration of the Trusts is concerned, they yet exemplify in a striking light the evils of the present system. Several scientific men were examined, in order to ascertain what might be done towards removing nuisances proceeding from the sewage, and affecting the health of the metropolis. A Mr. Fuller, seconded by several medical men of eminence, proposed a plan for purifying the air, by erecting furnaces communicating at intervals with the main sewers; and also suggested the closing of the gully-holes, as they are termed, with traps, so as to prevent the escape of noxious effluvia. The expense of erecting these furnaces would be considerable, and as no successful experiment had been made which would seem to warrant the risk of the expense, the Committee decline pronouncing an opinion on the plan, especially as Mr. Faraday, though he approved of it as one likely to succeed, was cautious and guarded in expressing his opinion. The minor improvement of traps for diminishing the admission of foul air from the gully-holes has already attracted the attention of the commissioners in several of the Trusts, and appears to have been applied with success.

The changes which are suggested by the Committee in the law of sewers are inconsiderable. They see so many objections to a central board superseding wholly or in part the local trusts—a change which they think would be unpalatable to the inhabitants of the respective districts—that they cannot recommend it, without further consideration, and the intermediate trial of smaller improvements. They therefore recommend that, as the composition of the Trusts has given much and general dissatisfaction (because, although consisting of respectable individuals, a great majority of them have neither the time nor the inclination to attend the courts), whenever a commissioner has absented himself from a majority of the meetings held for his district within the year, he shall be considered as having voluntarily resigned. It is also suggested that the number of commissioners should be fixed; and that vacancies should be filled up, in the city of London by the Common Council, as at present, and in the other Trusts by the vestries of the parishes in the respective districts, by rotation, and in proportion to their relative population and rental. And in addition to this improvement (which would, of course, give the rate-payers a control over the boards, and tend to destroy the close corporate system pursued), it is recommended that the interpretation of the law in the different Trusts should be uniform, instead of being, as at present, confused and contradictory: that the courts should meet at fixed times, and be thrown open to the public; and that the accounts should be subject to general inspection, publicly audited, and submitted annually to Parliament, copies being furnished to all rate-payers, on demand, at a reasonable price. They suggest that works of all kinds should be performed by public contract, with due notice given, but with the understanding that they are to be subjected to the approbation of the commissioners; there being no public works in which the inspection of responsible officers is so essential as in those connected with sewers, where defects, concealed easily, if not at once detected, are sure to be brought to light by entailing upon the district subsequently a load of vexation and expense.

The practicability of varying the amount of the rates according to the extent of the advantages enjoyed is attended with considerable difficulties. The principle on which a uniform rate was originally established has been already explained; and as long as the sewage was confined to the surface-drainage it was perfectly just. It certainly is now an unreasonable thing to impose precisely the same amount of rate on streets and houses which have no private underground drains, because there are no sewers within reach into which to conduct them, as upon other streets and houses amply provided with the accommodation of public and private drainage. But how to apportion the expense has been left undecided by the Committee; as has also been the other important point, of how best to secure combination and co-operation among the different boards.

There is also a great difficulty in fixing the limits of *indirect* advantage where there is no underground communication with the sewers. For instance, in the Holborn and Finsbury Trust, the inhabitants of the high lands about Hampstead and Highgate are exempted from the payment of sewers' rates, although they are, unquestionably, benefited indirectly by the sewage of the lower districts between them and the river, which are forced to provide a passage for their superabundant waters. But a court of law has decided that they are not liable, and no rate has been levied by the commissioners, for many years, beyond a certain line.

The sewers' rate is regarded as a landlord's rate, but is paid, in the first instance, by the occupying tenant. It would be expedient, where there is not a special agreement to the contrary, that a receipt given by the commissioners to the tenant should be in all cases a legal set-off against the rent; while houses untenanted for any length of time, and consequently not contributing to the wear and tear of the sewers, should be allowed a temporary exemption from the rate. This improvement would be a great relief to the inhabitants, as by the existing law the houses are liable for the rate, without regard being had to the recent entrance of the occupants, or the length of time a particular house has been unoccupied.

Whatever doubts exist as to the jurisdiction of the commissioners should be completely removed. Power should be given them, in all cases, to cover in, enlarge, widen, or otherwise improve open sewers; to compel builders to provide new districts with adequate communications with the main lines of sewers; to rate old property for the construction of new sewers; and to oblige the owners of all houses thus rated to form communications with the sewers when built.

SUPPLY OF WATER TO THE METROPOLIS.

Considerable dissatisfaction having been expressed on the part of the inhabitants of the metropolis, in and about the year 1828, relative to the quality of the water supplied for their use and consumption, by the different joint-stock companies incorporated for that purpose, and a petition on the subject, numerously signed, having been presented to Parliament, a Committee of the House of Commons was appointed, in July of that year, to inquire into the matter. This committee, after examining several scientific men, and inquiring into the system pursued by the different water companies, made their report to the House, in which they stated it as their opinion "that the then present state of the supply of water to the metropolis was susceptible of, and required improvement; that many of the complaints relative to the quality of the water were well founded; that the supply ought to be derived from other sources than those then resorted to; and that it should be guarded by such restrictions as would at all times ensure the cleanliness and purity of an article of such prime necessity."

Having given this opinion, the committee proceeded to recommend that Mr. Telford should be instructed to make such surveys as he should think necessary, in order to enable him to recommend a practicable and efficacious plan of supplying the whole of the metropolis with pure and wholesome water.

This recommendation of the Committee not having been acted upon for some months after their report was made, and the public dissatisfaction continuing to be strongly manifested, the matter was taken up by Sir Francis Burdett, as one of the members for the City of Westminster; and in consequence of his urgent appeals to Government, commenced in February 1829, and continued during two years, an order was at length given in March 1831, directing Mr. Telford "to make a survey, and report upon the best mode of supplying the metropolis with pure water:" this order was not, however, issued, until an offer had been made by Sir Francis Burdett, and accepted by the Lords of the Treasury, to secure the Government from any expense in the matter. This stipulation, so honourable to the public spirit of Sir Francis Burdett, was subsequently abandoned by the Treasury, upon the ground that it was the duty of the Government to give effect to the recommendation of the Committee of the House of Commons." To this position we doubt not our readers will cordially assent. It appears indeed surprising to us, how any hesitation could have been for a moment entertained by Government upon the subject.

The health of nearly a million and a half of people is surely an object of sufficient importance to warrant the outlay of a few thousand pounds, and it is not always that we have been accustomed to see so much regard paid to saving, on the part of those who have the custody of the public purse in this country.

The business could not have been placed in better or more competent hands than in those of the late Mr. Telford, whose eulogium will be read by many succeeding generations, in the works of grandeur and utility which he has left to attest his genius. The report which that accomplished engineer made to the Lords of the Treasury, of his proceedings and observations during the investigation which he was instructed to make, was presented on the 26th of March, in the present year, to the House of Commons, and was subsequently referred to a select committee, who have reported to the House the further evidence which they have collected, bearing upon the subject.

Mr. Telford states in his Report, that the water of the Thames being strongly objected to, in consequence of the impurities with which it is contaminated, he perambulated the district on each side of the valley of the Thames, and examined the streams which fall into that river in the vicinity of London.

In the result he found an abundance of pure, transparent water, within the distance of sixteen miles on the north, amply sufficient for the supply of three of the present water companies on that side of the Thames; and within ten miles on the south, he found as ample a supply for the three water-work companies on the south side of the river, both sources of supply being at a sufficient elevation for high and low services, without any necessity of having recourse to filtration, or indeed to pumping, except for a small portion of the high services.

The six companies here alluded to are, on the north side of the Thames, and supplying the north-western part of the town,—the Grand Junction, West Middlesex, and Chelsea; and on the south side, the Lambeth Company, South London, and Southwark. Besides these six, the New River, and the East London Companies, supply the north-eastern part of London with water drawn from the River Lea, the purity of which is considered to be satisfactory.

The total quantity of water distributed *daily* by these eight companies, to 191,046 houses, is stated by their directors to amount to the enormous quantity of 20,829,555 imperial gallons; of this quantity the north-western district receives 9,000,727 gallons, the southern district 4,134,000 gallons, and the north-eastern 7,694,828 gallons. The object undertaken by Mr. Telford was, therefore, to discover whence a daily supply of upwards of 13,000,000 of imperial gallons of pure water could be procured, so as to avoid the necessity on the part of the inhabitants of the north-western and southern parts of the metropolis, for using the impure and noxious compound now supplied to them from the Thames.

In the course of his survey, Mr. Telford examined the capabilities of the River Colne, which passes Uxbridge, after having received at Rickmansworth the waters of a considerable stream called the Chesham. He found that, unless after heavy rains, the Colne is an insignificant stream, quite inadequate to the purpose required, and when swollen by rains, that the water was unfit for domestic use, on account of its muddiness. About half way between St. Alban's and Watford, the Colne joins the Verulam, a transparent stream which occupies the St. Alban's valley. At Watford Mill, in the autumn of 1833, being the driest season, as regards the supply of rivers, experienced during the last half century, the Verulam river produced upwards of thirty cubic feet of water per second, or 16,200,000 imperial gallons daily, a quantity amply sufficient for the purpose, although new buildings in the north-western district should for many years continue to spring up as numerously as we have seen them rise during the last five-and-twenty years.

About two miles above Watford, the valley of the river Verulam affords a commodious situation for extensive reservoirs of water, and for allowing it to settle, if such should be deemed requisite. From this place, Mr. Telford proposes to convey a covered aqueduct, to descend with an uniform inclination of eighteen inches per mile to Primrose Hill, north of the Regent's Park, terminating there in a set of extensive receiving and distributing reservoirs at the height of 146 feet above high water in the River Thames. From those reservoirs each of the three companies supplying the north-western district, might be supplied separately and in any proportions that might be determined.

In order to deliver the water into the reservoirs at Primrose Hill, as pure as it leaves the Verulam, it is proposed to convey it through a covered aqueduct, at such a depth beneath the surface of the ground as to be secured from the effects of frost and from external injury, while it would not be subject to mixture with surface water. To remedy the unavoidable interruption occasioned by cleansing and repairing, Mr. Telford suggests the necessity of constructing the aqueduct with a double watercourse, separated by a footpath through its whole length; and to provide an adequate supply in the probable event of an increased population, he suggests that the aqueduct should be made sufficiently large to convey the whole quantity of thirty cubic feet per second furnished by the Verulam. The analyses of this water, which have been made by persons of adequate chemical knowledge, as well as the adduced testimony of various persons residing in or near Watford, leaves no reason to object in any way against the purity and excellence of the water which it is thus proposed to adopt.

The quantity of water required for the supply of the inhabitants south of the Thames, is, as we have seen, not one half so great as that needed for the north-western district. In the summer, when the largest quantity of water is required by the inhabitants, the supply need not amount to quite ten cubic feet per second.

To provide this quantity, Mr. Telford has proposed to draw a supply from the river Wandle, at a sufficiently high elevation, which is found on the Croydon branch of that river, at the east end of Beddington Park, ninety feet above high water in the River Thames. From this place an aqueduct, similar in its construction to that already described, may be carried in nearly a direct line to Clapham Common, and there terminate in the requisite number of reservoirs, at a height of eighty-two feet above the highest level of the Thames, and which, with the sole exception of Brixton Hill, exceeds the height of delivery now accomplished by any of the three companies supplying this southern district.

The main branch of the Wandle takes its rise in a singularly copious spring in the vicinity of Croydon, and after pursuing a westerly course for about three miles is joined by the Carshalton branch, which likewise derives its origin from several plentiful springs in that neighbourhood. The water of this river possesses at all times an uncommon degree of purity, regaining its transparency after the heaviest rains in the course of a few hours.

The quantity of water flowing down the Carshalton branch of the Wandle in the extraordinarily dry season of 1833, was at the rate of thirteen cubic feet per second, while the quantity discharged by the Croydon branch was at the rate of seventeen feet per second; there can therefore be no doubt of the adequacy of the source whence Mr. Telford has proposed to draw the supply of water necessary for the inhabitants of the southern part of the metropolis.

It seems unnecessary here to go into any description of the means possessed for the same purpose, as regards the north-eastern district, by the New River and East London Companies, both because it is not proposed to make any material or immediate alterations in their present arrangements, and because the necessary particulars may be gathered from other sources. There can be no reason for doubting the adequacy of the river Lea for the purpose of supplying, if such a necessity could arise, the whole northern district of London, since we are told, on the authority of Mr. Telford, that in the month of November, 1833, the quantity of water flowing down that river was found to be 110 cubic feet per second, *after supplying the New River*. Some suggestions are made in the Report, by adopting which the original purity of the water of the Lea would be preserved more completely than at present; but a description of these plans involves merely technical details, which would hardly be interesting to our readers. It may, however, be well to mention, that the water of the Lea is originally of the same quality as that of the Verulam, the sources of both being from the great chalk ridge which intersects Hertfordshire.

To effect the objects proposed by Mr. Telford, of conducting the waters of the Verulam and the Wandle for the supply of London, a considerable outlay of money would be required. An estimate of the cost of the various works is

given, showing an amount, for the north side, of £.785,965
and on the south side, of . . 391,875

Together . £.1,177,840

a very large sum of money, undoubtedly, and which being beyond the means possessed by the existing companies, must in the outset be advanced by Government. This consideration should not, however, be allowed to stand in the way of accomplishing so important, so necessary an object, as the supply of wholesome water to the metropolis, and especially as means have been pointed out whereby the interest could be paid upon the outlay without adding in any way to the public burdens. The plan for this purpose was proposed by the Directors of the Grand Junction Waterworks Company, and was to this effect—that the Government having advanced the sums required to bring the water to the spots whence the companies could receive it into their respective works, these establishments should each pay their proportion of interest according to the quantities of water respectively used by them, the rates of the companies being pledged to the Government as security for the payment of the interest. On the other hand, it was proposed that the companies should be authorized to make such an addition to the rates charged to their customers as would compensate them for this payment, taking into consideration that their constant annual outlay for pumping and filtration would be materially lessened by the adoption of the plans proposed. To this additional charge the public could not fairly object, the advantage of securing a plentiful supply of pure water being sufficiently great to compensate for the small additional charge that would be necessary for the purpose.

DISTRIBUTION OF DIRECT TAXES.*

The returns of payments of assessed taxes exhibit a curious body of facts which afford materials, though of course imperfect, for a more accurate view of the condition to which society has arrived, and the steps by which its progress has been made, than could well be obtained through any other medium. The materials for the following classification are obtained from official sources.

Houses and Rent.—The rental charged to the assessed taxes in Great Britain amounted to 10,261,334*l.* in the year 1821: to 11,106,237*l.* in 1826; and to 12,629,980*l.* in 1832, but in estimating the proportion which these sums bear to each other, it should be recollected that, in 1825, the tax upon houses rented under 10*l.* was repealed. This produced, in the year previous to the repeal, the sum of 1,171,667*l.* The total amount is distinguished into classes, which, for the year 1832, may thus be stated, together with the number of houses to which the amount was charged:—

	Rent.	Houses.
£ 10 and under £ 15	£1,653,481	146,828
15 „ 20	1,312,948	79,745
20 „ 25	1,103,281	53,159
25 „ 30	707,775	27,477
30 „ 35	970,892	31,869
35 „ 40	653,932	18,280

400 and upwards	309,973	529
Total	£12,629,980	443,090

* There are two or three apparent errors in the totals in this article, arising from the omission of fractional sums.

Exemptions for 1832.—Houses used for trade, offices, or counting-houses, 2,463; cottages, 1,138,705 (in 1824); farm-houses, 139,536.

The number of inhabited houses, the rent of which does not amount to 10*l.* and which were formerly assessed, is, of course, not included under the total of the last column. The number of such houses amounted to 130,959 in 1821, and to 181,872 in 1824, swelling the total for these years respectively to 447,543 and 546,932. If, therefore, we strike from these two years the houses under 10*l.*, we find that the total of 1832 affords an actual increase of 126,406 on the parallel total of 1821, and of 79,090 on that of 1824. Cottages are excluded altogether from the account.

Windows.—The following account classes the houses according to the number of windows they contain, and shows the amount of duty obtained from each class in the year ending 5th January, 1834:—

Houses having 8 to 10 windows	£153,301
„ 11 15	277,298
„ 16 20	218,146
„ 21 30	255,104
„ 31 39	101,159
„ 40 44	39,507
„ 45 49	26,263
„ 50 59	35,734
„ 60 69	22,420
70 and upwards	72,736
	£1,201,968

The following separate statement not only notices the amount of duty, but the number of windows, in the several years 1820, 1826, and 1832:—

	1820.	1826.	1832.
Number of windows	968,008	353,181*	380,195
Amount of duty	£2,578,580	£1,199,804	£1,273,918

Male Servants.—Under this head we are furnished with much curious information. The *number* of male domestic servants, with the amount which the tax on them produced, was as follows in the specified years:—

	Number.	Duty.
1820	85,344	£319,087
1823	85,731	158,630†
1826	90,061	167,167
1829	96,671	177,169
1832	103,381	187,280

These are the totals of a statement which shows the number of servants kept by persons distinguished as "bachelors" or "not bachelors," and classed so as to exhibit the number of servants, from one to eleven and upwards, in the employ of individuals, with the amount of duty contributed under each head. This information, so far as relates to the year 1832, may thus be quoted:—

	Not kept by Bachelors.		Kept by Bachelors.	
	Number.	Duty.	Number.	Duty.
By persons keeping 1	45,909	£55,090	6,468	£14,229
„ 2	14,965	22,110	1,929	4,918
„ 3	9,295	17,660	1,065	3,088
„ 4	5,985	13,017	731	2,320
„ 5	3,746	9,177	447	1,542
„ 6	2,581	6,646	382	1,365
„ 7	1,828	4,798	261	946
„ 8	1,484	4,155	166	630
„ 9	990	3,019	81	328
„ 10	615	2,044	70	302
„ 11 & upwards	4,639	17,744	444	2,148
Total	91,337	£155,465	12,044	£31,815

The above statement refers strictly to those who are properly called domestic servants, but employers are also subject to taxation for a numerous body of men, described under the comprehensive title of "other descriptions of

* The difference between this account and the preceding is occasioned by the exemption granted in the interval to houses under ten pounds.

† The difference between this sum and the preceding is explained by the reduction of duty which took place in 1822.

servants and male persons." As the duty has, in several instances, been repealed since 1820, an abstract will be rendered the most satisfactory by making it include the years 1820, 1826, and 1832.

Other descriptions of Servants & Male Persons.	1820. No.	1820. Duty. £	1826. No.	1826. Duty. £	1832. No.	1832. Duty. £

Exemptions in 1832 of servants and other male persons, 38,301.

Horses.—The information under this head is very complete. The following abstracts refer, like the preceding, to the years 1820, 1826, and 1832, which we have selected as affording a tolerably sufficient view of the whole period, the account for every year in which is furnished in the original tables. The first and second statements refer to riding and carriage horses.

Horses used for riding or drawing carriages.	1820. Number.	1820. Duty. £.	1826. Number.	1826. Duty. £.	1832. Number.	1832. Duty. £.
Persons keeping 1	119,444	343,401	118,726	170,668	123,668	177,772

,, 20 and upwards	1,124	7,418	1,102	3,636	1,142	3,768
	178,337	648,236	175,068	315,895	182,678	339,830

The following statements refer to *other* saddle or carriage horses, horses chargeable to modified rates of duty, and therefore discriminating their several qualities and uses.

	1820. Number.	1820. Duty. £.	1826. Number.	1826. Duty. £.	1832. Number.	1832. Duty. £.
Horses let to hire	1,500	4,312	2,006	2,833	2,073	2,979
Race horses	647	1,937	704	1,012	997	1,433
Horses, used for riding or drawing carriages, not exceeding 13 hands high.	8,699	18,267	20,237	21,248	24,689	25,870
Horses rode by farming bailiffs.	858	2,145	1,278	1,597	1,438	1,797
Ditto by butchers, where one is kept	2,882	8,142	3,044	4,375	3,364	4,835
Ditto, where two are kept, for the second horse	491	725	1,108	581	1,213	1636
Total	15,257	35,530	28,377	31,699	33,724	37,550

The next account, which refers to horses employed in labour, is more complete for the year 1820 than for any subsequent year, except 1821, when most of the duties were repealed. We therefore state separately the account for 1820, giving the single item retained in following years in a note.

	Number.	Duty.
Horses not wholly used in husbandry *	138,124	£145,029
Mules under 13 hands carrying coals, ore, &c.	2,611	391
Small farmers, under 20*l.* rent, keeping not more than two horses, &c.	43,887	6,583
Horses used bonâ fide in husbandry, 13 hands high	435,512	380,989
Under 13 hands, for husbandry or other purposes of labour	29,928	4,489
On farms under 50*l.* rent, (livelihood principally gained thereby)	68,336	10,250
Ditto 70*l.* rent, 13 hands high, and livelihood solely gained thereby	82,360	12,353
Ditto 70*l.* and under 100*l.*	59,737	14,933
,, 100 ,, 150	72,161	27,055
,, 150 ,, 200	51,055	26,779
	983,711	628,874

Exemptions. The number of horses exempted in 1832 was 645,959.

To the above information respecting horses, we may add, that the number of *horse-dealers* in Great Britain in the year 1832, was 1042, who paid duty to the amount of 14,025*l.*: 80 of the number belonged to the metropolis. The number of horse-dealers has, since 1820, decreased in London, from 111 to 80, and increased in the country from 890 to 962. The number of exempted horse-dealers was 1027, in the year 1832.

Dogs.—The information under this head, from the exemptions from, and evasions of, the duties, must necessarily be incomplete, and can only be understood to refer to the superior descriptions of dogs, kept by opulent persons.

	1820. Number.	1820. Duty. £.	1826 Number.	1826. Duty. £.	1832. Number.	1832. Duty. £.
Greyhounds	21,297	21,297	21,090	21,090	15,850	15,850
Pointers, hounds, setting dogs, spaniels, terriers, lurchers, or where persons keep two or more dogs.	105,149	73,604	113,358	79,350	106,316	74,421
Dogs, not being greyhounds, hounds, &c. and the person keeping one only.	185,865	74,346	205,335	82,134	215,795	86,318
Total of dogs, exclusive of packs of hounds	312,311	169,247	339,783	182,574	337,961	176,579
Packs of hounds	74	2,592	74	2,664	77	2,772

Exemptions.—52,414 is stated as the number of dogs exempted in 1832

Carriages.—Carriages have been so subject to taxation in every form, that the returns under this head leave little information to be desired. The number of four-wheeled carriages kept by private persons, with the amount of duty paid thereon was as follows in each of the years specified:—

	Number.	Duty.
1820	17,341	£212,888
1823	18,434	113,322†

* This is the retained item. 1826: number, 114,764; duty, 60,251*l.*—1832: number, 124,076; duty, 65,139*l.*

† The rate of duty was reduced in 1822, which accounts for the difference between this amount and the preceding.

	Number.	Duty.
1826 . .	24,058	£147,657
1829 . .	30,228	185,889
1832 . .	24,830	153,416

These numbers and sums are the totals in an "Account of the number of persons assessed for one four-wheeled carriage and upwards, for private use, specifying the number and the amount of duty charged in each class." From this account, we extract the statement for the years 1820, 1823, 1829, and 1832; introducing the year 1829 for the purpose of showing how the high number attained in that year was composed.

Four-wheeled Carriages	1820. Number.	1820. Duty. £.	1823. Number.	1823. Duty. £.	1829. Number.	1829. Duty. £.	1832. Number.	1832. Duty. £.
Persons keeping 1	13,689	164,268	14,855	89,130	23,284	139,704	18,163	108,978
—— 2	2,820	36,660	2,792	18,018	5,510	35,815	5,213	33,884

—— 4	156	2,340	136	1,020	219	1,642	236	1,770
—— 5	65	1,023	75	590	91	716	115	905
—— 6	6	98	18	147	53	434	36	295
—— 7	..	..	..	..	16	136	14	119
—— 8	8	140	..	..	8	70	8	70
9— and upwards	..	..	10	90	20	181	38	344
	17,341	212,888	18,434	113,322	30,228	185,889	24,830	153,416

Concerning other four-wheeled-carriages which could not be included in the above statement, the following is the account for the years 1820, 1826, and 1832.

	1820. Number.	1820. Duty. £.	1826. Number.	1826. Duty. £.	1832. Number.	1832. Duty. £.
Additional bodies .	65	409	66	207	21	66
Carriages let to hire .	344	4,198	404	2,424	602	3,612
Postchaises and carriages	5,064	53,172	6,117	32,114	6,761	35,495
Public stage coaches .	1,654	17,367	2,954	15,508	3,146*	16,516*
Four-wheeled carriages drawn by ponies, oxen, mules or asses :—						
	1820. Number.	1820. Duty.				
Drawn by one pony, &c., without springs	62	89	repealed.			
Ditto with springs, not metallic .	49	134				
Ditto with metallic springs . .	4	26				
Ditto with two or more ponies, &c.	27	234				
Carriages drawn by 1 horse					11,951	53,779
Ditto with wheels of less diameter than 30 inches drawn by ponies between 12 and 13 hands high . . .					742	2,411
Ditto used by common carriers					317	792
	7,062	74,667	9,475	50,046	20,373	96,090

The following is a similar statement with respect to two-wheeled carriages; but as from the repeals and re-organization of duty which have taken place since 1820, it is difficult to bring the numbers for different years under the same denominations, we shall state the accounts for 1820 and 1832 separately.

1820.	Number.	Duty.
Two-wheel carriages drawn by one horse	29,221	£189,936
Ditto drawn by two or more horses	700	6,300
Taxed carts without springs . . .	6,462	9,369
Ditto with springs not metallic .	12,857	35,356
	49,240	240,962

1832.	Number.	Duty.
Two-wheeled carriages, as described in 2 and 3 William IV. chap. 23, No. 1.	9,496	£14,244
Ditto common stage carts, No. 2. .	4,981	7,471
Drawn by one horse	47,250	153,562
Ditto by two or more horses . . .	269	1,210
Let to hire	2,625	8,531
Used by common carriers	661	826
	65,282	185,846

Exemptions. 2,602 was the number of carriages exempted in 1832.

The state of the duties up to 1825 enabled it to be ascertained how many carriages were made and sold every year, together with the other particulars stated in the following account, which refers to the year 1824:—

* This number and amount is for 1831, as the statement for 1832 is not given.

	Number.	Duty.
Persons licensed to make or sell carriages	835	£393
Four-wheel carriages made for sale .	1,780	2,225
Two " " . .	2,211	1,381
Taxed carts for sale	584	87
Four-wheel carriages sold by auction or on commission	185	231
Two " " .	313	195
Taxed carts	80	12
Total of four and two-wheel carriages and taxed carts made for sale, &c.	5,153	4,133

Game Certificates.—This account distinguishes the persons by whom certificates were taken out, with the usual statement of the amount of duty.

	1820. Number.	1820. Duty. £	1826. Number.	1826. Duty. £	1832. Number.	1832. Duty. £

Deduct Decrease . .				913,892
Total Increase on the year .			£	313,448

Revenue for the Quarter ending Oct. 10th, 1834, as compared with that ending Oct. 10th, 1833.

	1833. £	1834. £	Increase. £	Decrease. £
Customs . .	4,272,449	4,950,500	678,051	—
Excise . .	4,771,309	3,924,785	—	846,524
Stamps . .	1,681,726	1,659,008	—	22,718
Taxes . .	652,129	508,714	—	143,415
Post Office .	371,000	366,000	—	5,000
Miscellaneous .	4,394	1,712	—	2,682
Repayments of Advances for Public Works	87,303	99,527	12,224	—
	11,840,310	11,510,246	690,275	1,020,339
Deduct Increase . .				690,275
Total Decrease on the Quarter . .			£	330,064

The Revenue, as stated above, shows
An Increase on the year ending 10th Oct. 1834 of £313,448
A Decrease on the quarter „ „ 330,064
compared with the corresponding periods of the year 1833.

In consequence of the trade in Tea being thrown open on the expiration of the East India Company's charter, the duty, formerly collected by the Excise, was transferred to the Customs in the quarter ending 10th Oct. 1834.

This duty, in the Oct. quarter, 1833, amounted to about £900,000
„ „ 1834, „ „ 850,000
Decrease £50,000

In order to draw a comparison between the produce of the Customs and Excise, in 1833 and 1834, it is necessary to transfer the Tea duty, in the Oct. quarter, *from* the Customs *to* the Excise of 1834.

The Customs on 10th Oct. 1834, being		£16,225,261
	Deduct Tea duty	850,000
		15.375,261
Ditto	„ 1833	15,240,007
	Actual Increase on the year	£135,254
The Excise, on 10th Oct. 1834, being		13,946,348
	Add Tea duty received by Customs	850,000
		14,796,348
Ditto	„ 1833	14,542,957
	Actual Increase	£253,391

On the year, therefore, the Increase in the Customs and Excise is £388,645; but the value of the Increase is not accurately measured by that amount, because, in the Session of 1833, the following duties were repealed or reduced:—

Excise on Soap equal to	£593,000
„ Tiles „	37,000
Customs on Cotton „	300,000
	£930,000

Now three-fourths of these duties were collected in 1833 and none in 1834; therefore the revenue has recovered that deficiency of three-fourths, viz. £700,000; which, added to the present excess, is the measure of the real increase of consumption from lower duties, and of the augmentation of the industry and comfort of the people.

Pursuing the same rule with the *quarterly* account, it will stand thus:—

The Customs on 10th Oct. 1834, being	£4,950,500
Deduct tea duty	850,000
	£4,100,500
Do. 10th Oct. 1833	4,272,449
Actual decrease on the quarter	£171,949
The Excise, 10th Oct. 1834	£3,924,785
Add tea duty	850,000
	£4,774,785
Do. 10th Oct. 1833	4,771,309
Actual increase on the quarter	£3,476

It thus appears that the real decrease in the Customs is £171,949.

The reduction of duty on fruits at the close of this session may be estimated to have occasioned a loss to the Customs in the last quarter—

On currants,	of about £20,000
„ raisins and other fruits,	„ 20,000
To these sums may be added—	
Less duty paid on foreign spirits	„ 20,000
„ tallow	„ 20,000
„ tea	„ 50,000
	£130,000

The greater part of the deficiency is therefore accounted for, and we have no doubt the remainder might be traced partly to some temporary effect produced by reductions in other duties, and partly to the great scarcity of money during part of the last quarter. As the average payments to the Customs and Excise exceed half a million per week, it is evident that a slight holding back in paying duties would produce a very considerable effect on the receipts of the quarter. Of the duties paid on all the most important articles of import, almost every one shows a considerable increase on the year.

It must always be borne in mind that there are two or three circumstances attendant on a reduction in duties, which operate, in the first instance, to prevent the full benefit being felt by the consumers. Those who have stocks are anxious to get rid of them without loss, and for that purpose endeavour to maintain the full price; the producer, whether foreign or domestic, endeavours to share with the public by an enhanced profit; and in many instances the public, after being long deprived of an article by an excessive duty, take some time to acquire the habit of using it.

ABSTRACTS OF PARLIAMENTARY PAPERS.

New Churches.—The Fourteenth Annual Report of his Majesty's Commissioners for Building New Churches is dated August, 1834. Since the previous Report (see 'Companion,' No. 20, p. 156) there have been ten additional places of worship completed, which gives a total of 208 churches and chapels erected under the act, affording accommodation for 279,049 persons, which includes 153,568 free sittings for the use of the poor. The Exchequer Bills issued up to the date of the Report amount to 1,500,000*l.*

The commissioners have, since their last report, afforded, or expressed their willingness to afford, facilities, without any aid from the parliamentary funds, for obtaining additional burial-ground for the parishes of Handsworth, Yorkshire; Ringly, Lancashire; Sanky, do. Minchinhampton, Gloucestershire; Tynemouth, Northumberland; Carshalton, Surrey; Whitley, ditto; and also for obtaining sites for new churches and chapels at Summers Town, city of Oxford; Holdenhurst, county of Southampton; Stockton-on-Tees, Durham; Slad, Gloucester; Upleatham, Yorkshire; Tilstock, Salop; Loughborough, Leicester; Winterbourne, Gloucester; Levens, Westmoreland; and Islington, Middlesex. They have also, under the provisions of the 58 Geo. III. c. 45, divided St. Martin's, Birmingham, into two distinct parishes; and formed ecclesiastical districts out of the parishes of Great Budworth, Chester; St. Giles, Oxford; Kingston-upon-Thames, Surrey; and assigned a district chapelry, under the 59 Geo. III. c. 134, to the new chapel at Enfield, Middlesex.

Five churches and chapels are in progress of being built; plans for two chapels have been approved of, and grants are proposed in aid of ten churches and chapels. In the following cases, being within the jurisdiction of the commissioners, they propose to grant the perpetual patronage of chapels to the persons by whom they were built and endowed under the 1st and 2nd William IV. c. 38:—At Bude, Cornwall; Farcham, Hants; Mincham, Stafford; and Leven, Westmoreland. And to George H. Cherry, Esq., they have granted the perpetual patronage of the chapel at Denford, parish of Kintbury, Bucks, he having built and endowed it.

Persons Lost or Destroyed by Choke Damp and Fire Damp in Mines and Collieries.—A return has been made to the House of Commons of the number of persons lost by choke damp and fire damp in the mines and collieries of the different counties of England and Wales since 1810, so far as the same can be ascertained by the clerks of the peace, from the coroners' registers. The returns, however, are not perfect, as one or two clerks of the peace, mistaking the order from the Home Office, instead of applying to the coroners of their respective counties, have simply stated that no documents were in their possession from which to supply the requisite information; and several of the coroners who have been appointed in different years subsequent to 1810, have only given the returns from the date of their entering on office. The following is a list of the lives lost, in so far as stated in the returns obtained.

Chester	7	Salop	89
Cumberland	140	Stafford	104‡
Derby	19	Warwick	3
Lancashire	135*	York (North Riding)	29
Monmouth	3	York (West Riding)	116§
Northumberland	77†	Brecon	18
Nottingham	18	Flint	39

State Lotteries.—From the year 1807 to 1823 there were forty-eight contracts entered into with the Government by lottery speculators, under the name of state lotteries. There were three in each year, except in 1817, when there were two, and in 1818 when there was only one. The average number of tickets in each contract was 20,000, with the exception of the year 1817, when, in order to bring up the yearly number to 60,000, one contract had 40,000 tickets;—so also the one in 1818 had 60,000. The highest price at which the tickets were charged was 32*l.* 5*s.*, which was in 1823, when state lotteries were abolished; the lowest price 13*l.* 8*s.*; the average price was about 15*l.*

British Colonies.—A return has been made to the House of Commons of the establishment of the customs in each of the British

* The return from Lancashire is from 1827.
† The return from Northumberland is from 1814.
‡ The return from Stafford is from one of the coroners for the county who resides at Wolverhampton.
§ In addition to the above number there were 230 killed in mines and collieries, but it is not stated if from choke or fire damp.

colonies, as it stood on the 5th January, 1834, stating the salary of each officer, and whether any reductions have been proposed to be made, with the amount of contingencies in each office and colony. The following is an abstract of the totals in each establishment:—

Island or Colony.	Salaries.	Contingencies.	Reductions to be made as opportunities occur.
	£.	£.	£.
Barbadoes	5150	1127	1400

The Trigonometrical Survey of Ireland.—The trigonometrical survey of Ireland was commenced in the year 1825. The principal triangulation was begun in the summer of that year, and was completed in 1832. The secondary triangulation was begun also about the same time, and extends nearly over one-half of Ireland. At the end of 1825, a less minute survey was commenced, and had attained a progress of 1,800,000 acres per annum, when it was superseded, a more minute and detailed survey being determined on. This more minute and accurate survey was commenced in 1830; the number of acres surveyed on the 1st of June, 1834, was 3,036,452; and the amount of money expended from the commencement to the 31st March, 1834, was 298,435*l.*, to which may be added about 5500*l.* for the months of April and May.

A committee appointed by the Board of Ordnance to examine into the survey in September, 1833, estimated that, with the present establishment, (the expense of which is about 35,000*l.* per annum,) it would require twelve years to complete it. Lieutenant-Colonel Colby, who superintends the survey, is of opinion that if additional funds were allowed, such augmentations of the establishment might be effected as would enable the survey to be finished as accurately in seven or eight years, or less. The following are the numbers of persons employed on the establishment during the years 1833 and 1834:—

	1833.	1834.
Officers	26	23
Civil assistants	171	229
Royal sappers and miners	227	215
Labourers	220	290
	644	757

Tea.—A return of all the Company's Tea sold in June, 1834:—

Canton Bohea, from 1*s.* 11½*d.* to 2*s.* per lb.	700,000 lbs.
Fokien ditto, from 1*s.* 11½*d.* to 2*s.* 0½*d.*	800,000
Congou, from 1*s.* 5½*d.* to 4*s.* 1*d.*	4,394,000
Campoi, from 1*s.* 10½*d.* to 3*s.*	148,000
Twankay, from 1*s.* 8½*d.* to 2*s.* 11*d.*	1,323,000
Hyson skin, from 1*s.* 9½*d.* to 2*s.* 10*d.*	27,000
Hyson, from 2*s.* 11½*d.* to 8*s.*	341,000
Total lbs.	7,733,000

A return of all Private Tea sold in June 1834:—

Congou, from 1*s.* 7½*d.* to 4*s.* 4*d.* per lb.	398,083 lbs.
Caper Congou, from 1*s.* 7½*d.* to 2*s.* 7*d.*	170,118
Souchong, from 5*s.* 6*d.* to 7*s.* 6*d.*	43
Pekoe, from 2*s.* 11½*d.* to 5*s.* 7*d.*	47,131
Orange Pekoe, from 1*s.* 7½*d.* to 5*s.* 4*d.*	173,914
Hyson, from 4*s.* 2½*d.* to 4*s.* 5½*d.*	1,673
Gunpowder, from 6*s.* 9½*d.* to 8*s.* 8*d.*	6,837
Total	797,799

Money voted by Parliament for Canals, Improvement of River Navigation, Roads and Bridges, in Scotland, Ireland, and Canada.

Scotland.—From the year 1770 to 1813, a yearly sum was granted for military roads and bridges in Scotland, varying from 4000*l.* to 6000*l.*, with the exception of the year 1785, when the sum granted was only 800*l.* The total sum granted during that period was 241,918*l.* 8*s.* 3*d.*; and for *Highland* roads and bridges there was granted, in 1803, the sum of 20,000*l.*, and grants of either 20,000*l.* or 10,000*l.* were given down to 1821, (with the exception of the years 1819, 1820,) when the sum total amounted to 250,752*l.* 2*s.* The first grant in aid of the Caledonian Canal was made in 1803, when 20,000*l.* was given, which was increased in 1804 to 50,000*l.*, and a grant was continued regularly down to 1829, (with the exception of four years,) when the sum total amounted to 953,638*l.* 2*s.* The entire amount granted for these objects in Scotland has been 1,447,308*l.* 12*s.* 3*d.*

Ireland.—In 1818 there was voted for making a line of canal from Lough Allan to the river Shannon, 15,000*l.*; in 1819, 4000*l.* was given for the same object; and in 1820, 2023*l.* was voted for defraying the expense of a survey of the River Shannon. The total amount granted was 21,023*l.*

In addition to the sums voted by Parliament, advances have been made by the Commissioners of Public Works in Ireland, on account of works on the Shannon.

Canada.—In the year 1826 a grant of 15,000*l.* was given for canal communication in Canada, (Rideau and Ottawa Canals,) which was increased in 1827 to 56,000*l.*, in 1828 to 135,000*l.*, in 1829 and 1830 to 163,000*l.*, in 1831 to 296,000*l.*; and in the three subsequent years the grant has been successively 81,300*l.*, 40,000*l.*, 28,000*l.* Total from 1826 to 1834, 977 300*l.*

Scotland	£1,447,308
Ireland	21,023
Canada	977,300

STATISTICS, TRADE, &c.

Great Britain and Ireland.—The following statistical table is extracted from the Report of the Select Committee of the House of Commons on the Sale of Corn:—

	Extent in Statute Miles.		Area in Square Miles.	Population at different periods.				Increase of Population from 1801 to 1831.
	Length.	Breadth.		1801.	1811.	1821.	1831.	
England	425	300	50,210	8,331,434	9,538,827	11,760,565	13,091,005	4,759,571
Wales	150	60	8,125	541,546	611,783	717,106	806,182	264,636
Scotland	280	30 to 150	27,794	1,599,068	1,805,688	2,092,014	2,365,114	766,046
Ireland	235	182	30,370	. .	. .	6,846,949	7,767,401	920,452
Army and Navy	. .	. .	. .	470,598	640,500	310,300	277,017	

Population in Great Britain and Ireland, including Army and Navy, in the year 1831, 24,306,719.

Turnpike Trusts in Great Britain.—

	Number of Trusts.	Distance of Roads. Miles.	Annual Income from Tolls and Parish Composition. £	Annual Expenditure. £
England	956	18,244	1,051,311	990,342
Wales	69	2,631	37,456	34,782
Scotland	190	3,666	187,584	181,028
Total	1,215	24,541	1,276,351	1,206,152

County Rate.—The amount received in England and Wales for county rate in 1833, was 720,498*l.*

Liverpool Trade.—A return, obtained through the Treasury, gives the average number of passengers, chiefly individuals engaged in commerce, who sail yearly by the New York line of packets, at between 5000 and 6000. The average passage of the New York packets out, from land to land, is forty-one days; and from New York to Liverpool only twenty-five. It is supposed that 7000 letters per packet leave Liverpool for New York: this comprehends all the English, and a great deal of continental correspondence. The number of vessels that entered the port of Liverpool during 1833 is—British, 1790—tonnage, 408,984; foreign, 662—tonnage, 209,627. The amount of dock duties for the same year was 191,729*l.* 17*s.* 8*d.*

Falmouth.—The average yearly number of passengers, who sail by the Government packets from Falmouth to all parts of the world, is 250.

Metropolitan Police.—The number of individuals taken into custody by the Metropolitan Police during 1833, on various charges, amounted to 69,959. Of this number there were 29,880 taken up charged with drunkenness, of whom 18,487 were discharged when sober by the superintendents, and 11,393 were taken before the magistrates.

Consumption of Wheat and other Grain in the United Kingdom.—The consumption of wheat and other grain in the United Kingdom has been estimated by Mr. M'Culloch as follows:—

Time.	Wheat. Qrs.	Other Grain. Qrs.	Total. Qrs.
A year	12,000,000	40,000,000	52,000,000
Six months	6,000,000	20,000,000	26,000,000
Three months	3,000,000	10,000,000	13,000,000
Six weeks	1,500,000	5,000,000	6,500,000
One month	1,000,000	3,333,333	4,333,333
Two weeks	500,000	1,666,666	2,166,666
One week	250,000	833,333	1,083,333
A day	35,714	119,048	154,762

London, Edinburgh, and Dublin.—Table showing the population, and the number of beer-shops and public houses, in each of these metropolitan cities, at the close of the year 1833. (From the papers in the Appendix to the Report of the Committee of the House of Commons on Drunkenness.)

	Population.	Public Houses.	Beer Shops.	Total.
London	1,511,728	4073	1182	6255
			Grocers licensed.	
Dublin	232,362	1019	67	1086

The number of public houses in Edinburgh is not filled up; but the number of individuals brought before the magistrates on charges arising from drunkenness, amounted, in 1833, to 3289, of whom 448 were imprisoned, 714 held to bail, 1268 were dismissed, 850 were fined, and the produce of the fines was 513*l.* 16*s.* 6*d.* The population of Edinburgh by the last census was 137,000.

Nux Vomica, Cocculus Indicus, and Paradise Grains.—A Return of the Quantities of these Articles entered for Home Consumption during the last five Years.

	Years.	Quantities entered for Home Consumption.	Amount of Duty charged	Rates of Duty charged.

Bank of England.—The liabilities and assets of the Bank of England, on the average of the quarter from 1st July to 23d September, 1834:—

Liabilities.		Assets.	
Circulation	£19,126,000	Securities	£28,691,000
Deposits	14,754,000	Bullion	7,695,000
Total	£33,880,000		£36,386,000

Emigration to Upper Canada.—The number of emigrants who entered Upper Canada during the year 1833 is estimated by the Governor at 21,000. The amount of money expended by Government in encouraging emigration to that province during the years 1831, 1832, and 1833 was 23,434*l.* 14*s.* 9½*d.*

Emigration to New South Wales.—During the years 1832 and 1833 there arrived in New South Wales 2569 emigrants, on their own resources; and in addition to this number, there were 1784 free persons for whom Government made advances or gave bounties, to the amount of 13,901*l.* 0*s.* 9*d.* The total number of emigrants in 1832-3 is 4,353.

New Suspension Bridge in Hungary.—On the post road to Karansebes, near Lugos in Hungary, an iron suspension bridge, of an entirely new construction, 60 feet in length and 23 feet wide, has been recently completed. Instead of the towers, which generally act as supports, cast-iron arches are here employed. The two superior chains of suspension are omitted, but the chains on which the bridgeway rests are firmly united to these arches by means of hanging iron rods and pillars, so that all the different parts forming a compact whole, scarcely any tremulous motion can arise. The mode of construction is less costly than that ordinarily employed in suspension bridges. For the purpose of putting its capabilities to the test, eight waggons, loaded with bricks, to each of which two horses were attached, besides sixty men, forming altogether a weight of about eight tons and a half, were placed on the bridge, and it supported the pressure admirably. It has been named after the Emperor Francis, and the following inscription has been placed upon it:—"*Magamon Függok*;" I am dependent on myself.

New Plough.—A new plough has been invented at Loches (in the department of the Aube), which is almost self-acting. It requires no one behind it to direct the share, and a single man, or even a youth, may at the same time drive two or three horses, each of them attached to a separate plough. In mechanism and arrangement it does not at all resemble Granger's, and is less complicated: although entirely constructed of iron, it is lighter, and the draught for the horse is diminished by one-fourth in comparison with ordinary ploughs. It has neither lever, nor balance, nor pressure, nor springs. By means of a very simple helm, the breadth and depth which it is wished to give the trench are determined. No deviation is occasioned by the steepness or stonyness of the surface, or even by the roughness of fresh-cleared land. It has the additional advantage of clearing the extreme ends of the ridge, which has never yet been done by the lever system. It will not be more expensive than a common plough.

Russian Currency.—An ukase has been issued by the Emperor of Russia on the subject of the value of foreign coins, which it states, both gold and silver, and others of good alloy, were circulated last year among the people, and not only have been received in many of the governments for more than their value, but in others have caused considerable embarrassment in monetary transactions. It then declares the following table to be the value at which foreign monies hereafter designated will be received in the treasuries of Government from the 1st of September, 1834, to the 1st of September, 1835:—

		Intrinsic value. Silver Roubles. R.	c.	Paper Roubles. R.	c.
GOLD MONIES.					
France	40 francs	9	69	35	36
	20 francs	4	84	17	66
Sardinia	20 lires	4	80¾	17	54

Germany	Zwanziger, or 20 kreutzers	0	17¾	0	63

UNITED STATES.—*Army and Navy.* The army of the United States, as now constituted, consists of, dragoons, 363; artillery, 1778; infantry, 3225; unattached soldiers and recruits, 678; total, 6,054. Militia, according to the late returns, 1,346,116.—*Navy.* Vessels in commission: one ship of the line, three frigates, fifteen sloops of war, and six schooners. In ordinary: six ships of the line and six frigates. At the different depôts have been delivered frames of live oak for four ships of the line, seven frigates, and four sloops. Contracts have been made for the frames of one ship of the line, and one sloop of war.

Commerce.—The exports of the United States have been estimated, for the years 1831, 1832, and 1833, as follows:—

	1831. Dollars.	1832. Dollars.	1833. Dollars.
Domestic articles,	61,277,057	63,137,470	70,317,698
Foreign articles,	20,033,526	24,039,473	19,822,734
Total	81,310,583	87,120,943	90,140,432

The aggregate value of the imports is estimated for the same years, at

Dollars, 103,191,124 101,029,266 108,118,311

The imports include 1,806,529 barrels of flour, and 276,978,884 lbs. of cotton, in 1831; 864,919 barrels of flour, and 322,215,122 lbs. of cotton, in 1832; 955,788 barrels of flour, and 324,698,604 lbs. of cotton, in 1833. Among the items of import in 1832 were 14,634,822 lbs. of tea; 15,698,050 gallons of molasses; 99,955,020 lbs. of coffee; and 85,689,944 lbs. of brown sugar; with 11,999,089 lbs. of white sugar

The imports of the United States average more than 100,000,000 dollars per year, the exports more than 86,000,000, and the raw cotton more than 31,000,000 dollars. Last year the whole value of domestic products and manufactures of every description amounted to 70,317,698 dollars, and raw cotton to 36,193,005 dollars.

The tonnage of registered and licensed shipping was, in 1831, 1,191,176 tons; in 1832, 1,276,846 tons; in 1833, 1,439,450 tons.

The arrivals at New York, in 1833, were 1350; in the first 8 months of 1834, 1398. The passengers in 1833 amounted to 41,752, being only 1856 more than have arrived during the first 8 months of 1834.—*New York Paper.*

POLITICAL RETROSPECT FOR OCTOBER, 1834.

GREAT BRITAIN.

THE destruction of the two houses of parliament by fire, on the night of the 16th (the particulars of which will be found in another place), deserves to be noticed as a public event. It is also, we think, to be regarded as a great public calamity; for however desirable it might have been that the two legislative bodies should be both more conveniently and more splendidly accommodated than they were in the apartments in which they lately met, there was no necessity that the new building should rise literally out of the ashes of the old one. Of that, indeed, which to some is the only thing that makes a building worth caring for—mere architectural beauty—but little has been destroyed by this catastrophe. The loss of property, however, has been very great; and we fear that many documents, books, and other articles, have also fallen a sacrifice to the flames, the price of which is not to be named in money, since they are what no money can restore. But for the sake especially of the proud and venerable recollections associated with the buildings now in ruins, we lament the sad visitation that has thus suddenly levelled them with the ground. They were by far the most interesting historical monuments which our land possessed; and as monuments we would have had them preserved, even after they had been superseded in their other uses by more commodious and more imposing structures. Who would not grieve to hear that some convulsion of nature had thrown down the Acropolis of Athens, or obliterated the Roman Forum? That ancient pile was our Forum and Acropolis. In the room that was the House of Commons—now presenting only a heap of rubbish, enclosed by bare and roofless walls—English liberty had, for nearly three centuries, its chief seat and temple—

> "Hic illius arma,
> Hic currus fuit;"

and if any spot can be hallowed by patriotism and eloquence—by memorable events, and words and acts mighty in their consequences—this is one which, even when the building that once covered it shall be utterly swept away, will never be looked upon without emotion by the nobler order of minds, while the name of England shall endure. "It is in vain," as the 'Examiner' has eloquently observed, "to strive to disregard the scenes or the memories of the past. We cannot do it. The present, in which we live, is made up mainly of them, and the experience they have bequeathed to us. Men are we, says the poet, and must grieve when even the shade of that which once was great has passed away."

Parliament, which on the 25th of September had been prorogued to the 23d of October, was on that day further prorogued to the 25th of November. The Lords Commissioners met for this purpose, along with the representatives of the Peers and Commons, in the Library of the late House of Lords, which was fitted up with benches, a representation of the throne, &c., for the occasion.

SPAIN.

THE financial embarrassments of the country have continued to occupy the attention of the Cortes. After several reported "final arrangements" in the Chamber of Procuradores, or lower house, which were upset and succeeded by other "last settlements," giving room in the mean time to much speculation on the Stock Exchange of Paris, where many persons have been utterly ruined, the following plan relative to the national debts was decided upon by the Procuradores.

There was to be a recognition of all foreign loans, contracted before and since 1823, with the exception of one of the French loans, called, from the directing banker, "Guebhard's loan." But this was followed up by a proposed division of all these debts into two portions, or two-thirds active, and one-third passive. At the end of a year, dating from the passing of the plan into a law, the active debt was to be converted into a new capital at five per cent. This was followed by a promise (and nothing more satisfactory) that means shall hereafter be found to sink and pay off the passive debt, and that there shall be created a sinking fund, at one-half per cent. per annum, for the gradual redemption of the active portion of the debts.

This plan excited great indignation in the monied interest, and a reasonable complaint was made, that the statements of the Cortes financiers were deficient in clearness, and their promises wholly unsupported by tangible securities. This project has been brought up to the Proceres, or Peers, *who have resolved to petition in favour of Guebhard's loan.*

In the lower house, Count Toreno, the Minister of Finance, expressly stated that both the English and the French ambassadors had urged the propriety of respecting the rights of the shareholders of Spanish obligations in general, and of such as were their own countrymen in particular. He also declared that the present revenue of Spain was scarcely sufficient to defray her in-door and every-day expenses—that paltry reductions in the allowances to the court, &c., would go for nothing—and that it was absurd to think of forcing a sale of national or church property at such a moment as the present. He repeatedly urged that Spain could not show her face as a borrower, in one of the money markets of Europe, unless she preserved unspotted faith with all her former creditors. It is now said, however, that a new loan for 400,000,000 of reals is in process of formation for the Cortes. Against this constitutional loan, the pretender Don Carlos, who is trying to raise a loan for himself, has protested through the means of a legitimate banker called De Haber, who informs the European public by newspaper advertisements, "that this loan of 400,000,000 of reals, or any other loan that may be decreed by the authorities at Madrid, *will never be acknowledged by his majesty Charles V.*"

The Spanish Cortes are placed in a situation of difficulty which might perplex and confound much better financiers and more experienced men of business than they consist of. They seem, however, to have thrown away a claim to respect and sympathy, which they might easily have retained. Instead of adopting a simple, honest, straight-forward line of conduct, they have endeavoured to better or conceal their case by ingenuity and manœuvres.

On the 8th of October the procuradores unanimously voted the draft of a bill excluding Don Carlos and his descendants from the throne, and expelling them from the soil of Spain for ever. The debate lasted three days, but did not elicit any new points either of fact or argument. It would be more serviceable to the cause of the young Queen, if, instead of votes, the Cortes could send proper reinforcements of troops to the revolted provinces of Biscay and Navarre, to expel the pretender and put an end to the horrors of civil war. The state of that unnatural contest seems to have varied little since we last wrote. It was confidently asserted, and for some days believed in certain quarters, that the Carlists had taken the important city of Bilboa, but it now appears that nothing but a mere demonstration was made before a suburb of that town—that the insurgents were driven back with loss—and, finally, that the Carlists are wholly unprovided with proper artillery and other means for the capture or siege of fortified towns.

No military operation of any consequence has taken place. Rodil has been removed from the command of the Queen's forces in the north, and the gallant, but now aged, Mina appointed to succeed him. We have not yet received the intelligence of Mina's joining the army, which remains *ad interim* under the orders of Lorenzo. On receiving his dismissal from the command, Rodil protested that all his plans had been thwarted by the government at Madrid, who left him insufficiently supplied with men, money, provisions, clothes, &c., and that it was not in the power of man to do more than he had done with such means as were placed at his disposal. In his anger and disgust he threw up all the honours and titles he had received, not even reserving to himself his rank of procere, or peer.

According to recent letters, reinforcements for the Queen's army in the north have reached Vittoria; but winter, meanwhile, is setting in, and that season is felt with extreme severity among the Pyrenees and mountain-passes that are mainly the scene of this protracted warfare. In a preceding part of the present Number of the 'Companion,' our readers will find more ample explanations of several features in the old internal government of Spain, which we have from time to time alluded to in our Monthly Retrospect.

FRANCE.

This country has been fortunately tranquil, and without any stirring event. Some discontents, manifested by workmen and members of clubs and unions at Lyons, have been grossly exaggerated for party purposes. A new sedition and general riot, with fighting in the streets of the city, as in April last, which were described in some of the continental papers, were in fact merely petty police affairs, originating in misunderstandings between the workmen and their employers.

The Chamber of Peers is specially summoned for the 15th of November, for the purpose of trying the persons now detained in prison for political offences. It is said by many that this will be nothing but a form; and that an amnesty, if not general, yet almost so, will be made public before any of the individuals charged with political crimes be brought to the bar. There has been some quarrelling between these prisoners and the jailers and turnkeys that have charge of them, but such an event is usual and natural enough.

King Louis Philippe has perfectly recovered from a trifling indisposition, which, as a matter of course, was set down in certain quarters as an incurable disease.

Count D'Erlon, the newly-appointed Governor of Algiers, has addressed a proclamation to "all Arabs high and low," living in that part of the world. He tells them, "*above all, not to lose sight of the fact that the French will never abandon the African soil.*" To impress them with a lofty idea of *their* and *his* master, Louis Philippe, he describes him as "that powerful monarch, whose force is invincible, whose troops are as numerous as the grains of sand in the deserts of Sahara, and whose ships plough through every sea." After this pompous preamble, he tells the Arabs that the King of the French "wishes to reign over them by his favours alone." Knowing what we know, and have explained,* of the unjustifiable conduct and violent aggressions of the French in the country subsequently to the surrender of Algiers by the ex-Dey, we were rather startled by a part of the proclamation in which Count D'Erlon promises "to throw a veil of indulgence over all the former offences of the Arabs." Although we do not much admire the bombastic tone of the Count's address, we sincerely hope, for the well-being of all parties, that he may establish the firm yet humane system of colonial government he promises; that he may free the natives from the vexations and atrocities of badly-disciplined troops and immoral and rapacious *employés*, and so put an end to mutual retaliation and cruelty. He will be a good and very clever man if he can undo the mischief that has been done by, or under the rule of, his predecessors in Algiers.

PORTUGAL.

We mentioned in our last Retrospect the alarming state of Don Pedro's health. In less than a fortnight after the Cortes had almost by acclamation decided that he should retain possession of the regency during the remainder of his daughter's minority, without any restriction of the royal authority as conferred on the sovereign by the national charter, he was obliged to restore to the same chambers the power they had sanctioned or delegated to him. On the 17th of September, being conscious of his approaching end, he received extreme unction, or the last consolations of the Catholic religion; on the 18th, he addressed a letter to the Cortes, stating that he had "complied with the solemn duties of a son of the church;" that his health prevented him from continuing "the due administration of public affairs;" and begging them, under such circumstances, to provide a proper remedy. The Cortes immediately voted Donna Maria, who is now fifteen years and six months old, to be of age, and fully competent to take upon herself the administration of affairs. In the Chamber of Deputies this measure was adopted unanimously, and without discussion, but in the upper house it was opposed by six peers. On the 19th, the Duke of Palmella, at the head of a deputation of the Cortes, waited on the young Queen at Queluz, informing her of the vote passed, which called her to the immediate exercise of royal authority. In her answer, Donna Maria deplored the cause that had necessitated the measure; promised to do every thing in her power to maintain the constitution of the kingdom, and to endeavour to imitate the virtues, and follow in all respects the example and advice, of her august father. On Saturday the 20th, she repaired to Lisbon, and, going in state to the Cortes, took the oaths prescribed by the charter. Her first important act was a change in the ministry. She appointed the Duke of Palmella Prime Minister and Secretary of State, with Senhors Vasconcellos, Carvalho, Terceira, Villa Real, and Agostinho Freire, for a cabinet. On the 24th of September her father expired.

Only four days before his demise, and when death was hourly expected, his daughter wrote him a letter, with the preamble, "I, Donna Maria, by the Grace of God, Queen of Portugal, the Algarves and its dominions," &c. &c., to compliment him with "the decoration of Grand Cross of the ancient and very noble order of the Tower and Sword, of Valour, Loyalty, and Merit." We pity the intellect of those, whoever they were, that suggested this solemn foolery!

Most of the foreign correspondents of our newspapers, who cannot conceive so difficult a case as a prince's dying by natural means, have taxed their ingenuity to prove how Don Pedro may have died of "slow poison." 'The Morning Herald's' "own correspondent" distinguishes himself as usual. His language is worthy of his philosophy. "The mode," says this enlightened critic of foreign nations and proceedings, "in which this infernal purpose is said to have been effected, was (if the propagators of the story are to be believed) by eggs boiled in poisoned water, diluted with a solution of arsenic, or other metallic poison, some minute particles of which would be absorbed through the pores of the shells, *and slowly cause death six or eight months afterwards, but with fatal certainty.*" After telling us, what none but the ignorant mob of Lisbon ever believed, that Don Pedro's old father, John VI., was poisoned by some monks at Belem, he adds, "The identical poison-mixing Jeromite friars, of eight years ago, may still survive, masters of their craft, and bearing a far more intense hatred to Don Pedro, for his wholesale abolition of all monastic orders, than they ever did to his father."

It is said that the public tranquillity of Lisbon was not in "the least interrupted" by the death of Don Pedro: but immediately after this information, we are told that Miguelite cries and songs were heard in the neighbourhood of the capital: that a poor porter was massacred in the streets of Lisbon for saying Don Miguel was coming: that a Miguelite guerilla chief narrowly escaped with his life, by taking refuge in a guard-house, in front of which, and almost under the windows of the Minister of Justice, who had taken no notice of the affair, there lay the corpse of another Miguelite of some note, who had been recognized, in spite of his disguise, in one of the squares of Lisbon, where a number of individuals *in the garb of gentlemen* killed him with *pen-knives, pocket-knives, and sticks;* that the next day another victim of the same party was assassinated by an officer, in the corn-market; and in short, that scarce a day passes without the murder of some *real* or *suspected* Miguelite. "In every other respect," say our news collectors, with a *sang-froid* we scarcely envy, "the most profound tranquillity prevails, and is likely to prevail; every movement is *in favour* of the Queen, and the maintenance of the constitution." But surely such movements as these can never favour the establishment of justice and good government; nor can they fail, if not speedily stopped, to draw down disgrace on a cause which, otherwise, is endeared to the sympathies of all liberal minds.

At the same time the dispossessed friars, to whom a decent subsistence was promised out of their own confiscated property, receive nothing from the government, and are driven to the desperation of starvation. This host of malcontents is swelled by the discharged employés of the late government, who are also left without any provision. As we foresaw, it is more difficult to sell church and monastic property than to declare it confiscated. Few purchasers appearing in the market, a project of law on the sale of national property, and the means of facilitating it, has been laid before the Cortes. According to this plan, "the industrious classes and persons of small means" are to be allowed to make purchases by paying one-fifth in ready money, and the remaining four-fifths in sixteen equal instalments, in sixteen years. All the landed property, moreover, *is to be divided into the greatest number of parts possible.*

The Duke of Leuchtenberg, brother to Don Pedro's widow, son of Eugene Beauharnois, and grandson to

* See Companion for June, 1834. No. XVIII.

Josephine, the first wife of Napoleon, is said to be the husband selected for Donna Maria. Meanwhile reports are abroad, that Don Miguel, taking advantage of his brother's death, is about to renew his struggle for the throne. According to some accounts, indeed, he has quitted Italy, and is already in the Peninsula; but this, though possible, is scarcely probable.

TURKEY.

THE recent arrival in England of another ambassador from Sultan Mahmoud has again turned public attention in the direction of Turkey, and re-awakened speculation and surmise. Our political alarmists continue to add darker and darker shades to their picture of the East, and to dwell on the imminent risk of a war; but at the same time we learn that the Sultan has dismantled his fleet, has ceased to press the levies for his army, and has been giving himself up to the enjoyment of unusual festivities, showing every sign of confidence and tranquillity. If he has ever been tempted, by the troubled aspect of things in Syria, to aim at regaining his lost authority from Mehemet-Ali, it is probable that the Egyptian's energy and success in rapidly putting down the late insurrection have disabused him of such vain hopes for the present. We feel happy that it should be so, for we are confident he has more to gain by attending to the improvement of the government of the extensive dominions that still remain in his undisputed possession, than by renewing a war, the success of which must be very doubtful, for the recovery of territories that for the greater part were never properly subjected to himself, or to any of his predecessors on the Ottoman throne. The distant and powerful pashas of Syria were constantly in a state of revolt, setting the authority of the Porte, whose revenues they appropriated, at defiance. Even in their more tranquil times those pashaliks contributed but very little to the financial means of the empire. The Turks and Arabs, though both Mohammedans, and of the same sect of that faith, and though both (nominally at least) for so long a period under one government, differ very materially in character, interest, and views. The great chain of Mount Taurus is the natural line of separation between the two races. South of that line the Arabic language, and Arabic manners and customs, prevail almost universally, whilst north of it the very different idiom and manners of the Osmanlis or Turks obtain. Few travellers, we believe, have gone through the gorges of Mount Taurus from Syria, into Asia Minor, or *vice-versâ*, without being struck by this most evident and decided demarcation. This important fact ought to be present to the minds of all who speculate on the affairs of the Sultan and the Pasha of Egypt.

We have been accustomed of late years to hear the Turkish empire described as being in the last stage of weakness and decrepitude; but at the same time several writers who have travelled and lived in the country have undertaken to prove, not only that the malady is not so far advanced, but that Turkey possesses within herself the means of speedy cure. The most successful of these advocates is Mr. Urquhart, the author of an interesting volume called 'Turkey and its Resources,' published in London last year. Many of his facts and premises are curious and correct; but from our own personal observation, both in European and Asiatic Turkey, we should be inclined to say that in the conclusions he draws from them, he has been occasionally hurried away by his wishes, and a sanguine temperament.

Mr. Urquhart very properly attaches great importance to the existence, in a great portion of the empire, of municipal institutions, but he forgets to mention that these local councils have been perpetually controlled or thwarted by arbitrary power—that their votes have been prescribed or rescinded by the divan of Constantinople, or by the Pasha nearest at hand; and that Sultan Mahmoud himself, by his destruction of the Ayans and provincial gentry, struck a fatal blow at such institutions, by depriving them of their best supports and ornaments.

It is said that during the last two or three years the Sultan has done much to strengthen these municipalities, and to circumscribe the powers of pashas, and other governors in the provinces, and we certainly have written evidence to this effect. But unfortunately it is much easier to issue a decree at Constantinople, than to enforce its execution at the ends and corners of the empire. Certain vices are slow of cure, and among these we may safely class the long-confirmed habits of oppression, rapacity, and corruption.

In nations and masses of men, we can expect no sudden changes; and it is only by the progress of civilization, and the enlightenment of the people, that pashas, mutzelims, and aghas, will cease to oppress on the one hand, and the poor Turkish and rayah subjects to tremble and obey on the other. In this respect Mahmoud has gone the right way to work. He has established numerous schools, and out of his hampered and embarrassed resources he has contrived to give encouragement to the writing, printing, and diffusing of many elementary and other works. He has also taken a newspaper into his pay, and the Turks are now instructed as to the views and wishes of their government by the columns of the 'Moniteur Ottoman,' which is published weekly at Constantinople, in the Turkish and French languages, and contains the public ordonnances issued in the name of the Sultan. The paper has now been in existence for some two years; but with newspapers as well as with disciplined troops, the Pasha of Egypt preceded the Sultan by several years. A journal in Arabic and Italian was published on the banks of the Nile as early as 1827.

Though some of our readers may have incidentally heard of the Constantinople paper, we believe few of them can have seen any extracts from it. Our news-caterers for the daily papers have neglected this source, which, if not always authentic, is always a curious one. Occasionally the editor pleads the cause for which he is retained with considerable ability, and the state papers he lays before the public are really official and interesting documents. This editor, a Frenchman of the name of Blacque, formerly conducted a paper at Smyrna, which was among the most violent opponents of the cause of Greek independence. It was called the 'Spectateur Oriental,' and was supported by the Franks of different nations settled in the country, and published only in the French language. Except in a very few cases the paper was a dead letter to the Turks, but notwithstanding this, the Pasha of Smyrna was said to patronize it to a valuable extent. It advocated in all things the cause of the Sultan, and the local interests of the Frank merchants, which were supposed to be diametrically opposed to those of the emancipated Greeks. It not unfrequently exceeded the limits of moderation and propriety, and on one occasion (at the beginning of 1828) the French authorities at Smyrna thought fit to stop it, to seize the types and press, and to confine M. Blacque for some hours on board a French man-of-war then at anchor in the bay. Other types, however, were found, and the paper was continued under the altered name of 'Le Courrier de Smyrne.' A friend of M. Blacque's brought this matter before the French Chamber of Deputies, but they passed to the order of the day, declining to take any notice of it. It was pleaded in extenuation of the summary mode of proceeding of the French authorities, that the liberty of the press could not be accorded to one man alone in a country and on subjects where and on which, free discussion, *pro* and *contra*, could not be indulged in,—where, indeed, there was no one to reply or check the torrent of invective and dogma,—where such replies, moreover, which must advert to Turkish vice and folly, could not be published with safety.

The gratitude of the Turks, however, recompensed M. Blacque: and when the Sultan determined to set up a paper of his own, he was invited from Smyrna to Constantinople, where a good house with offices, and a handsome salary, were assigned him as editor. To assist him in his labours a *bureau* was formed, consisting of persons well versed in the French and Turkish languages. It will be understood from the few words we have said, that the 'Moniteur Ottoman' is to be regarded as *ex parte* evidence, and the voice of those who govern, rather than that of those who are governed. But even in this sense, the paper is as deserving of attention as the gazettes and journals of the despotic states of Europe, or as those German newspapers which are notoriously sold to Russia. It also becomes us, both in justice and policy, to hear both sides of the question. We shall therefore mention a few of the important subjects which, from time to time, have appeared in the columns of the Constantinopolitan paper in the course of the present year.

No. 78,—22nd January, contains a proclamation for the purpose of protecting the people against oppression and unauthorized exactions of the pashas and government officers, and a private letter from Adrianople, exemplifying the benefit derived there from the publication of the 'Moniteur Ottoman,' as a check upon misrule, and an incentive to

good. Also a review of Mr. Urquhart's book on 'Turkey and its Resources.'

No. 79,—29th March, contains the annual nomination of the pashas to their respective provinces, from which we extract the following curious particulars, more immediately relating to the individual who now rules Egypt; nominally as a tributary of the Sultan, but virtually in defiance of his authority.

"The Sultan in the decree confirms Mehemet Ali Pasha of Egypt, Aleppo, Safed, Sayda, Beyroute, Tripoli in Syria, and the Island of Crete, Governor of Candia and Egypt, Sandjak, Jerusalem and Nablous, Canée and Retimo. His son Ibrahim is also confirmed as Governor of Djedda, and Pasha of Adana. Some important inferences may be drawn from the decree, regarding the relations of Turkey with the Barbary States, over whom she still claims the supremacy. Hussein is appointed Pasha of Tunis, Yussef of Tripoli, and the name of the Pasha of Algiers is left blank. The government of Tunis has been long exclusively Moorish and hereditary; those of Tripoli and Algiers, Turkish, but independent. The government of Tripoli has lately undergone a change by the abdication of Yussef in favour of his younger son Ali, but his eldest brother disputes the title, and our own government is now engaged in protecting British interests during the conflict of the two parties. The sanction of the Turkish government appears therefore, not to have been given to the abdication of Yussef, which is represented not to have been altogether voluntary, but influenced by a continental power in close alliance with the Pasha of Egypt. Whether Mehemet Ali has views of aggrandizement in the west, as well as in Syria, a little time will probably develope. The appointment to the Pashalik of Algiers being left blank, sanctions the report that the embassy from Turkey to France has some relation to the claim of the Sultan on that old dependency of his empire."

No. 80,—12th April, contains a report upon, and regulations of, the department of architecture; and a petition from the rayas of Varna, who had fled in 1828 and 1829, during the Russian war, to be allowed to return to the dominions of the Sultan, together with the general amnesty, and the address from the rayas in grateful acknowledgment of the clemency exercised towards them.

No. 81,—26th April, contains an important decree, declaratory of the rights, privileges, &c., of the rayas, or inhabitants of the empire not Mussulmans, (exhibiting the most unrestricted toleration); the amount of contributions which may be legally required of them: and the severest penalties affixed to exactions by pashas and others.

No. 82,—10th May, contains a decree for fixing the value of the specie in circulation, for the restoration of which, on fixed principles, the government expresses great solicitude: and also the following most important decree for the organization of the Ottoman militia. As this last document is a very novel one for Turkey, we will give its principal clauses.

Although the defence and preservation of the vast provinces of the empire and frontier towns require a considerable number of regular troops, yet the government is thoroughly convinced that to adopt the resolution of uniting this number of men under its banners, and to lodge them in barracks, in order to hold them as a disposable force at all times, would deprive agriculture of many necessary hands, which would in consequence suffer grievously: the contributions thus spread over a smaller number of cultivators would become too burdensome, and the various trades equally forced to contribute a larger portion to the wants of the state would also suffer severely.

With the double aim, therefore, of securing the defence of the empire by a sufficient military force, and at the same time not diminishing the resources of agriculture, his Highness has decreed that there shall be a militia or national guard established under the denomination of Redifi Asakiri Mousourei Mouhammedigé, and has likewise ordered the Seraskier Pasha to make, without delay, every necessary arrangement for the general organization of this militia. The regular troops actually serving under the banners receive in times of peace as in war, their pay, their food, and clothing; they are quartered in barracks, and entirely maintained at the expense of government; because they are looked upon as always engaged in active service. The militia now ordered to be established will not be constantly employed like the regular troops, but is intended to co-operate with the troops of the line, for the defence of the territory, in case a war should break out. When once under the banners, the militia corps will receive with the army their pay, food, clothing, and every necessary, according to the prescribed rules for supplying the wants of the troops. Excepting in time of war, the militia-men will apply themselves as usual to agriculture or their various trades, at the same time not neglecting military exercises.

It is a duty imposed by his religion on every Mussulman to acquire the means of defending his country, his family, and his property, and to attain, according to the improvements of each successive age, a degree of skill and capacity that shall render him nowise inferior to his enemy. The good of his country, then, as well as his individual interest, impel him to neglect no opportunity of perfecting himself in the art of war. There can be no doubt that all Mussulmans filled with these sentiments will appreciate the advantages of this organization, and be emulous to enrol themselves in the new militia, which service will offer no obstacle to their usual pursuits, or molestation to the tranquillity of their lives; neither will it, without the most urgent necessity, call them from the bosom of their families.

So long as a system of general organization was wanting, the precipitation with which the levies were made rendered it impossible to make any choice of the men destined to be immediately sent against the enemy, whether young or old, fitted for military service or not. They were marched off indiscriminately, though they might never have borne arms or even known the use of those intrusted to them. They were taken without examination, the only important object appearing to be to complete the number required, and despatch them to their several destinations. The arms were furnished by the people of each district at their own cost, so that amongst troops raised in this disorderly manner, it often happened that young and robust warriors, who knew how to handle their arms and longed to distinguish themselves, for the glory of the empire and protection of their own firesides, literally perished in the heat of battle for want of proper arms to defend themselves. Others experienced the same fate from want of practice in wielding the weapon placed in their hands. Many again sunk under toils unfitted for their years. All these troops, uselessly led out to war, presented but an insignificant force for the defence of the country, while their inglorious loss left a sensible void in the population.

Formerly, when the order was given to levy troops in a district, from the day of enlisting until the time of departure, enormous expenses for removal, food, arms, equipment, whether of infantry or cavalry, weighed upon the inhabitants of the district, who, thus ruined, or grievously burdened, gave utterance to loud and legitimate complaints. It is to shield the people from these overwhelming charges, this disastrous depopulation, and, at the same time, to ensure the integrity of the Ottoman territory, by an imposing number of well-disciplined troops, that his Highness has determined that in future every Mussulman in the vigour of youth shall be instructed in the use of arms and military tactics, at the same time devoting only his moments of leisure to these exercises without being required to quit his native town or the labours of his profession. The Council is actively employed in regulating the basis of this new system, and determining the necessary measures of detail for carrying it into execution.

HOLLAND AND BELGIUM.

It may be mentioned as an indication of a kindlier feeling having taken place between the governments of Holland and Belgium, that a considerable trade is now permitted to be carried on between the subjects of the two kingdoms.

Dutch vessels pass through the interior waters of Holland, and convey goods to the Belgian frontier near Batz, where they are put on board Belgian vessels and conveyed to Antwerp.

On the other hand, goods are taken in Belgian vessels from Ghent to Ter Neuse, to be thence conveyed in Dutch vessels to Holland.

Some direct trade is likewise carried on between the two kingdoms in vessels under the Kniphausen flag, which take goods from Ghent, and, passing down the Scheldt to the sea, proceed to Rotterdam.

CHRONICLE OF OCCURRENCES.

September 24. Don Pedro, Regent of Portugal, died this day at half past two o'clock, P.M. He had resigned the regency a few days before his death.

25. Three men, unionists, were prosecuted by Messrs. Grissel and Peto, the builders, for exciting a riot at the North London Hospital, and obstructing the operations of the workmen. They were sentenced to be imprisoned and kept at hard labour for periods of ten, eleven, and twelve months each.

27. Carlile, the well-known publisher of deistical works, was charged at one of the police-offices by his former friend, the *Rev.* Robert Taylor, with an assault. The charge arose out of remarks which Taylor made while lecturing at the 'Rational Lecture Room,' which provoked Carlile to strike him. The defendant was fined three pounds.

28. Dr. Grey, the Bishop of Bristol, and the author of several theological works, died this day. He was in his seventy third year.

30. The annual inauguration dinner of the Sheriffs of London and Middlesex took place on the evening of this day. The Lord Chancellor and a number of eminent persons were present. One of the sheriffs (Sheriff Raphael) was formerly a Jew, but is now a Roman Catholic.

Towards the end of the month of September, several failures occurred in London, which produced considerable excitement among the merchants of the city. That of W. and T. Raikes and Co., one of the partners of which was the Governor of the Bank of England, was the most remarkable, and produced some alarm lest he had used his influence in involving the bank in any of the speculations of the firm; but for this apprehension there was happily no foundation. Another firm, Bentley, Dear and Co., of Cheapside, doing business to the amount of 400,000*l.* yearly, were rendered bankrupt by the forgeries and subsequent disappearance of Bentley, the principal partner. The other partners were not at all implicated.

October 2. Hutchinson, the private in the Guards, whose case of flogging attracted considerable attention at the time, was tried for desertion. He was sentenced to be imprisoned for six months, and kept at hard labour.

4. His Excellency Namik Pasha, who comes to this country on a special mission from the Ottoman Court, landed at Dover.

7. The Dublin mail packet, Thetis, took fire while lying at Liverpool, and the flames reaching a small barrel of gunpowder, caused an explosion. The principal part of the vessel, which cost originally 17,000*l.*, was destroyed.

8. A bark of about 350 tons burden, named the Elizabeth of London, caught fire while lying in the basin of the London Dock Company, and was completely burned down to the water's edge.

— A young man, eighteen years of age, a midshipman in the navy, the son of a naval captain, and entitled to property when he became of age, was apprehended for various robberies committed at Sir Charles Forbes's, and other houses where he was on habits of intimacy. He was subsequently tried, and pleaded guilty.

— *Birmingham Musical Festival.*—This grand festival was held in the new town-hall, a most magnificent structure. The receipts of the first day amounted to about 3000*l.* It ended on the 10th, when the entire proceeds had amounted to nearly 14,000*l.*

— A meeting of the merchants, brokers, and others interested in the tea trade, was held in London, for the purpose of proceeding with the sale of the first cargo of teas brought from Singapore, in the Colombia, since the abolition of the Company's monopoly. Part of the tea was discovered to be trash, and was, with unanimous consent, withdrawn from sale.

— The Duke of Wellington presented the 93rd Highlanders, lying at Dover, with a pair of new colours. A banquet was afterwards given to the officers and men.

10. A fire occurred at Liverpool, in extensive warehouses, the upper rooms of which were filled with cotton, the lower with hogsheads of sugar, while in the cellars were upwards of 200 hogsheads of rum. It was got under, after destroying property amounting to nearly 20,000*l.*

— A soldier in the Tower, convicted of attempting to shoot his serjeant, was sentenced to perpetual drill.

15. A petition, signed by upwards of 32,000 persons, praying for the release of Mr. Webb from the remainder of his confinement at York, (he was convicted of manslaughter, caused by administering Morison's pills,) was delivered to Mr. Rice, Acting Secretary of State for the Home Department, to be laid before his Majesty.

16. This evening, soon after six o'clock, a fire broke out in some buildings near the lower end of the House of Lords, and raged so fiercely as to render it quite impossible to save the edifices from total destruction. The wind was high, and increased the conflagration, but being from the south-west it contributed to save Westminster Abbey from sharing the fate of the Houses of Parliament. This event has been the most stirring and extraordinary of the month. It has called into operation all the grandiloquence of the reporters to the newspapers, who have vied with each other in their descriptions of the scene, and has created an intense interest throughout the country. Though the cause of the fire is not yet clearly ascertained, and an investigation is going on, there seems to be little doubt that it was accidental. By immense exertion, and at great risk, Westminster Hall was saved from sharing the fate of the rest of the buildings, and the various courts of law, with all their deposits, were preserved; but the fire, though thus confined, burned nearly the entire night, destroying the Houses of Lords and Commons, the Painted Chamber, part of the Speaker's residence, the house of Mr. Ley, the Chief Clerk, and leaving only a few rooms standing amid the ruins. There was no disturbance whatever amongst the immense crowd which the scene brought together, but a great many accidents occurred to firemen and others, by the falling of portions of the ruins, and from the melting lead pouring down upon them. The libraries of the two Houses of Parliament were saved, and a great portion of the valuable furniture of the Speaker; but the extent of the damage and loss in the papers and records will not be ascertained for a considerable time. These official papers and records were dragged out in the confusion, and conveyed away in carts, cabs, and by individuals, in any way in which they could be laid hold on, and carried off to houses in the neighbourhood, especially to St. Margaret's church, opposite, the floor of which was covered with them, while the gardens attached to the Speaker's house, fronting the Thames, were strewed with books, furniture, and papers of every description. Many eminent persons exerted themselves, at great personal risk, during the night of the fire; and for several successive days the crowds who visited the scene of destruction were immense. Their Majesties visited it on the afternoon of the 18th.

20. Imputations having been thrown upon the military who were engaged in assisting at the fire, as having broken open the cellar of the Speaker's house and made free with the wine, a strict inquiry was instituted, when it appeared that the imputation was entirely groundless, the conduct of the military having been exemplary and praiseworthy.

22 and 23. Cabinet Councils were held for the purpose of inquiring into the origin of the fire, when a Mr. Cooper swore positively to his having heard of the fire within two or three hours after it broke out (and when it was raging most fiercely) at Dudley, 120 miles from London. But no other person confirmed the extraordinary circumstance, though Mr. Cooper seemed to have no doubt whatever of the fact. From inquiries that have since been made, it appears clearly that he must have been mistaken.

23. This day being the day appointed for the re-assembling of Parliament, the ruins of the houses presented a singular appearance. The library of the House of Lords, which is standing, was selected as the temporary place of meeting. A quantity of books were placed in an irregular manner on the shelves; a gold-burnished chair was mounted at the extremity of the room, to represent the throne; a seat or form was placed for the Lords Commissioners, and a miniature representation of the wool-sack; benches and cross-benches were erected, and all covered with scarlet cloth; a table was placed in the centre; and the clerks and official persons present were wigged and robed in the usual manner. The Lord Chancellor then prorogued the parliament to the 25th of November; after which the individuals in attendance representing the Lords and Commons, with several ladies who were present, proceeded to view the ruins. On the same day one of the labourers employed on the ruins was accidentally killed.

17. One of the subordinates in the Liverpool Custom-house, who had been reduced on account of intemperance, in a drunken fit of revenge, shot William Southgate, Esq., the Surveyor of Customs, while standing in the Custom-house yard. The unfortunate gentleman died on the 19th. The assassin, on being examined before committal to prison, was found to have a small phial of laudanum suspended from his neck, under his clothes.

— A dinner was given to Sir George Murray, at Perth, by his constituents, Lord Stormont in the chair.

18. A reporter, who had been excluded from the Marylebone Police-Office, by the sitting magistrate, on account of some dispute relative to a report alleged by the magistrate to be false, was reinstated, by order of the government authorities.

21. A number of individuals who had been taken up on charges of theft at the burning of the Houses of Parliament, were examined. Many of these individuals were highly respectable, and had been tempted to possess themselves of papers and articles of small value, as relics. Several were committed for trial, and others were discharged.

— Death of the Earl of Derby, grandfather of the Right Hon. E. G. Stanley, the late Secretary of the Colonies. He was in his eighty-third year.

THE COTTON MANUFACTURE.

No. III.

THE Supplementary Report (Part I.) of the Factories Inquiry Commission is dated the 15th of February, and was ordered by the House of Commons to be printed on the 25th of March last. It is itself a short and very general statement; but the papers appended to it form a considerable volume. Of these the first is a report from Dr. James Mitchell, the actuary, containing a digest of the answers obtained from various factories in different districts of the kingdom to certain queries circulated by the commissioners.

Our notice of Dr. Mitchell's calculations must here, of course, be confined to those of them that refer to the cotton manufacture. Their principal object is to present a view, first, of the proportion of males and females employed in the manufacture at all different ages; and, secondly, of the average weekly wages obtained by them. They are arranged into 10 tables, according to the districts from which the returns they are founded upon were obtained.

We shall give a short abstract of these tables; but we must express our opinion that the information they afford—at least, upon one of the two points to which they refer, the earnings of the operatives—is of very little value. In the first place, the term "*weekly* wages," even if *wages* and not *net earnings* were what it was desirable to ascertain, is a great deal too vague to furnish the grounds of any useful conclusion; for the length of time which the operatives work in a week varies not only in different districts, but in different factories in the same district, and even, from the occasional occurrence of holidays, at different periods of the year. The rate of wages can only be correctly exhibited by taking, not a week, but a certain number of hours, as the basis of the calculation. The most material defect, however, in the returns upon which Dr. Mitchell has proceeded, is their apparent neglect of any distinction between skilled and unskilled labourers,—two classes, the one of which is so differently circumstanced from the other, that they cannot be mixed up together without wholly vitiating the estimate. The effect is visible on the slightest inspection of the present tables. Take, for example, the column headed 'Average weekly wages of males,' in the table respecting the cotton factories of Lancashire. Here we have 6 persons, at the age of 51, receiving each 14*s.* 11*d.* weekly; immediately under them, 7 persons at the age of 52, receiving each 24*s.* 4*d.*; and then again, 6 persons at the age of 53, receiving only 10*s.* 11½*d.* each. We should certainly draw a very wrong conclusion if we were to infer from these entries that there were any peculiar qualities in persons of the age of 52 which made it the interest of cotton manufacturers to pay them so much higher wages than they paid to persons either a year younger or a year older: or that, in point of fact, the rates stated were those at which labourers of any of the ages in question were generally paid. It is evident that if the labour of a man of 53 is to be had for 10*s.* 11½*d.* per week, and that of a man of 51 for 14*s.* 11*d.*, it cannot be customary to pay labourers of the same description, aged 52, so much as 24*s.* 4*d.* In the same manner, when we find three men, aged 62, earning 20*s.* each, while in the next line it is stated that two men of the age of 63 earn only 7*s.* 9*d.* each, and, a little lower down, that one man, of the age of 67, receives only 7*s.* 3*d.*, while two men, a year older, are paid 14*s.* 6*d.* each, we shall not be expected to take these figures as recording anything more than so many local and temporary accidents, which as elements for a calculation of averages are of no use whatever. The comparatively high rate of wages represented to be received by persons of the ages of 52 and 62 is doubtless to be accounted for by the circumstance of some of the factories chancing to have clerks or other high-salaried servants of these ages, whose earnings being taken into the general account, have swelled those of all the workmen who happened to be born in the same years with themselves. Results deduced from such returns must evidently be to a great extent delusive. Dr. Mitchell, indeed, seems himself to be aware of this. 'I have one observation,' he says, 'to make on what will appear, perhaps, an anomaly in the tables. In some instances, and more particularly at the advanced ages at which only very few are employed, the average wages will sometimes appear very high, and sometimes the contrary. Where there is only a very small number, all averages are liable to such irregularity: and in the present case, if it happen that there are a few of any particular age in offices of trust and confidence, the high wages which they receive produces the high average. I felt bound to include every individual, and have made the return in every case as I found it, and did not feel at liberty to make any allowance or deduction on any account whatsoever. It will be observed also that, in some instances, the average of wages is unusually low, which arises in a similar manner where there are only a few at a particular age, and some of them, from debility or other causes, only earn wages less than usual.'

Dr. Mitchell's first table refers to Lancashire, the district in which the English cotton factories are chiefly situated. At the factories in this district, from which returns were obtained, there were employed, in all, 3770 males and 3844 females. Of the males there were 246, and of the females 155 below the age of 11; the former earning, on an average, 2*s.* 3½*d.*, and the latter 2*s.* 4¾*d.* per week. The number of males from the age of 11 to 16 was 1169, earning each 4*s.* 1¾*d.* per week, and of females 1123, earning 4*s.* 3*d.* each. The males from the age of 16 to 21 were 736, earning each 10*s.* 2½*d.*, and the females 1210, earning 7*s.* 3½*d.* From the age of 21 to 26 the males were 612, earning 17*s.* 2¼*d.*, and the females 780, earning 8*s.* 5*d.* each. Beyond this age the numbers of either sex were comparatively small: of males from 56 to 61 there were only 28; and of females from 46 to 51, only 23. The highest wages of the males were those earned by operatives between the ages of 31 and 36, being 22*s.* 8½*d.* per week: among the females, the highest wages were earned by those between the ages of 36 and 41, but they only amounted to 9*s.* 8½*d.*

The second district comprehends Glasgow, and the counties of Lanark, Renfrew, Ayr, and Stirling. Returns were received from mills in this district at which were employed 4631 males and 7445 females. The females appear greatly

[WILLIAM CLOWES, Printer, Duke Street, Lambeth.]

to preponderate from about the age of 11 to beyond 30. Under the age of 11 the males were 283, and the females 256; but from 11 to 16 the males were 1519, and the females 2162; from 16 to 21 the males were 881, and the females 2452; and from 21 to 26 the males were 541, and the females 1252. The average weekly wages of the males below 11 were only 1*s.* 11¾*d.*, and those of the females only 1*s.* 10¼*d.* As in the case of Lancashire, the males who obtained the highest wages were those between the ages of 31 and 36; they earned, on an average, 20*s.* 9*d.* per week. The maximum average of wages obtained by females was also earned by those of this age, and amounted to 7*s.* 4½*d.* Comparatively few males were employed in the factories after the age of 51, and few females after that of 41.

In the third district, that of Aberdeen, the disproportion of males and females appears to be still greater than at Glasgow, the number employed of the former being only 56 to 383 of the latter. While there were 22 females below the age of 11, there were no males below that age. The wages of these 22 females averaged 1*s.* 9½*d.* per week, and the highest average wages of females were 6*s.* 3*d.*, which were obtained by those between the ages of 31 and 36. The maximum average of male wages was 17*s*, being that of the operatives between the ages of 36 and 41.

Returns were also obtained from two cotton factories at Belfast, the results of which are arranged in a fourth table. The total number of male operatives here was found to be 217, and of females 470. Of the weekly wages of the males, the lowest average was 1*s.* 9*d.* for those below the age of 11, and the highest 21*s.* 5*d.* for those between the ages of 36 and 46. The females below 11 earned only 1*s.* 6½*d.* each, on an average; and, except that one woman of the age of 64 appears to have been paid 12*s.* a week, the maximum of female wages was 5*s.*, which was obtained by those between the ages of 21 and 26, and also by those between the ages of 36 and 41.

It thus appears, that while in the cotton factories in Lancashire the males are to the females as 100 to 102, in those of Glasgow and the neighbourhood the males are to the females as 100 to 160. 'The cause of this remarkable difference,' observes Dr. Mitchell, 'does not appear, and I am unable to say whether it arises from any difference in the physical condition and superior hardihood and strength of the Scottish women, as seems to be indicated by the reports of Sir David Barry; or whether it be that, from the great number of factories in the West Riding of Yorkshire and in Lancashire, the same proportion of females cannot be obtained, and the manufacturers are therefore driven to employ a greater proportion of the more expensive labour of the males. If the Scotch manufacturer get the females to work as well as the males, he must derive a great benefit from their labour being much cheaper.' We shall have occasion to return to this subject in the sequel. The great diminution of female operatives of the age of 21 is no doubt to be ascribed to the circumstance that at that age they for the most part get married, when the care of their families necessarily withdraws them from the labours of the factory.

The small amount of the wages of very young children employed in the factories, Dr. Mitchell justly considers to be anything rather than a matter of regret. 'There will be,' as he remarks, 'the less loss to the parents if they be withdrawn altogether from the factories, and sent to receive education, as they ought to be at that period of life.' He is also disposed to regard it as a fortunate circumstance, that the wages of females are so much lower than those of males. 'Nature,' he observes, 'effects her own purposes more wisely and more effectually than could be done by the wisest of men. The low price of female labour makes it the most profitable as well as the most agreeable occupation for a female to superintend her own domestic establishment, and her low wages do not tempt her to abandon the care of her own children. Nature thereby provides that her designs shall not be disappointed.'

We shall now proceed to the Tables calculated by Mr. Stanway from the returns made by the cotton manufacturers of Lancashire to a series of queries issued by the commissioners appointed for that district, and the explanatory Preface introducing them by Mr. Cowell, one of those commissioners. The most important results of Mr. Stanway's calculations are arranged in their natural connexion, and their mutual bearings traced and illustrated, in Mr. Cowell's preface: and we shall therefore follow, for the most part, the course of that paper in our abstract.

[redacted]st article on the cotton manufacture (see *Companion*, No. 22), we noticed a calculation of Mr. M'Culloch, according to which the number of persons directly employed in the different branches of the manufacture throughout the United Kingdom was estimated at about 800,000, besides about 100,000 more employed as engineers, machine-makers, &c. The amount paid in wages to this vast body of persons was rated in the same statement at about 21,000,000*l.* sterling.

In regard to this calculation, it is to be remarked that it rests mainly upon the two following assumptions: first, that the value of the cotton goods of every description annually manufactured in Britain amounts to about 34,000,000*l.*; and secondly, that the average rate of wages of the persons employed in the manufacture does not exceed 22*l.* 10*s.* a year. If the value of the manufactured goods should turn out to be less than is here assumed, and the average rate of wages to be higher, each of these circumstances (the other elements of the calculation remaining as Mr. M'Culloch has taken them) would go to reduce the estimate of the number of the persons employed.

Now, it is admitted by Mr. M'Culloch himself that Mr. Kennedy, 'to whose opinion,' he justly remarks, 'on a matter of this sort, the greatest deference is due,' considers the annual value of the British cotton manufactured goods as rated a great deal too high when supposed to amount to 34,000,000*l.* sterling. And, on the other hand, it appears from Mr. Stanway's calculations, that, taking the whole number of operatives, male and female, young and old, in England (exclusive of Scotland and Ireland) who are employed in cotton-working by *power*, their net annual earnings average not less than 27*l.* 2*s.* for each.

These considerations alone would lead to a suspicion that Mr. M'Culloch's estimate considerably overrates the number of persons employed in the manufacture. And this conclusion is strengthened by another result of Mr. Stanway's calculations, which is that the whole number of operatives in England earning "a livelihood in cotton factories *moved by power*, and employed in carrying on the preparing, spinning, weaving, and accessary mechanical departments within the walls of them," amounts only to 212,800, exclusive of clerks and warehouse hands, of whom the former may be nearly 600, and the latter between 3000 and 4000.

If this number be near the truth, although it applies, in the first place, to England only, and comprehends those operatives alone, who habitually work in cotton factories, to the exclusion of course of "hand-loom weavers, printers, bleachers, dyers, cotton-thread lace-makers, (an enormous and growing branch of the cotton manufacture,) and many other branches of manufacture either arising out of, or immediately dependent upon, the spinning of cotton by power," we may be satisfied that Mr. M'Culloch's estimate is greatly exaggerated. The extension of the survey over Scotland and Ireland, and the addition of the various classes, large as some of them are, to which Mr. Stanway's statement does not refer, certainly would not raise the 212,000 to 900,000. As for the grounds on which Mr. Stanway's calculation rests, we can here only state generally, that it is deduced from a comparison of the quantity of cotton yarn ascertained to be annually spun, with the number and description of hands returned as employed during a certain space of time in three spinning mills assumed to be of average capabilities, and known to produce at a certain rate. The total numbers of weavers and other workmen are estimated according to the proportion which these classes appear to bear to the spinners in the factories from which the returns were obtained. These returns comprehend 67,819 persons: and of these 42,401 were engaged in preparing and spinning cotton, 23,920 in the weaving department, and 1,498 as engineers, mechanics, and roller-coverers, &c. Of the whole 212,800 persons employed in cotton factories, it is estimated that no fewer than 86,623 are under the age of eighteen.

One primary object of the queries circulated by the Manchester commissioners, and of the tables constructed upon the returns to these queries by Mr. Stanway, was to ascertain exactly the average net earnings of the cotton worker. "The features," says Mr. Cowell, "which peculiarly distinguish the Lancashire forms of inquiry from the generality of statistical inquiries are, that they distinguish wages from net earnings, and that they do not seek to ascertain the latter by the day, week, month, or year, but *by the hour*: a method which is not only the most precise that can be imagined, but which the prevalent system of daily re-

gistering the number of hours and minutes which the mill works, and other customs which obtain in cotton-making, rendered of easy adoption.* Had the question in the Lancashire forms of Inquiry related either to "weekly wages," or "weekly net earnings," the reply would have been vague, and the tables uncertain. Weekly wages are subject to various deductions for gas, for oil, for pay to assistants, for fines, for steam, &c. &c., and even in some cases for a portion of the rent of the mill itself. Some manufacturers, in making their returns, would have made these deductions, others would not; some would have made certain deductions, and not others. It would have been impossible to distinguish between these cases, and no certainty could have attached to the averages and calculations deduced. Again, had the query related to "weekly net earnings," much vagueness would still have attached to the answers, for a week may comprehend forty, fifty, sixty, or one hundred hours work; but as the query related to the hours themselves, the time employed in each mill to realize a certain amount of net earnings, is accurately defined."

Returns to the queries were obtained from about 300 cotton factories, and 50 silk factories; and of the former 151 were approved of as being both accurate and complete, and 70 more as being accurate as far as the answers extended. From these 221, and from 4 returns from nightmills, Mr. Stanway constructed his tables, which accordingly exhibit the actual state of things relative to 225 cotton-mills, as it was in the month ending 4th of May, 1833, all the returns being made with reference to that particular period of time.

The first of Mr Stanway's tables relates to the 151 mills from which complete returns were obtained. The following are the most important general facts which this table establishes. The number of hours during which each mill worked in the month ending 4th of May, 1833, appears to have varied from 207 to 315. The total number of persons employed in the 151 mills, was 48,645, of whom 31,414 were engaged in preparing and spinning the cotton; 16,040 in weaving it; and the remaining 1,191 as engineers, mechanics, roller-coverers, &c. Their total net earnings amounted to 100,971*l.* 18*s.* 11½*d.*, and the average weekly net earnings of each individual, calculated for 69 hours, appears to have been 71.93 pence at the mill where it was lowest, and 167.70 pence at that where it was highest; the general average being 125.13 pence, or somewhat under 10*s.* 6*d.* per week.

From a supplementary table it appears, that of the 48,645 hands employed as above stated, 13,710 were adult males, and 14,821 adult females, (that is, had completed their eighteenth year,) and that of those under eighteen years of age, 10,294 were males, and 9,790 females. Of the males under eighteen, however, there were in the direct employment of masters only 3,585, while 6,557 were in the employment of operatives. Of the females under that age, on the contrary, 6,091 were in the employment of masters, and only 3,511 in that of operatives. Taking all the persons employed, the average number of hours worked by each during the month appears to have been 271.6.

A third table distributes the 48,645 hands into eight different branches or departments of cotton-working in which they were engaged. From this it appears that of the adults there were employed in the mule spinning 5,103 males, and only 1,189 females: but in all the other branches (with the exception of the department of engineering, and other mechanical operations,) the females were greatly more numerous than the males. Of the children, the males preponderate over the females, in the department of cleaning and spreading the cotton, as well as in that of mule-spinning, but in no other. Of the children employed in weaving there were only 1,631 males, while the females were 3,674. The number of hours worked by each person during the month, varied very slightly in the different departments of the manufacture; being (with the exception of roller-covering, in which it was 278, but where only 170 persons were employed) 275.8 in cleaning and spreading, where it was highest, and 271.7 in throstle-spinning, where it was lowest. Calculating the week at 69 hours, the average weekly net earnings of each individual in the different branches, were, of the engineers, firemen, and mechanics, 246.01 pence; of roller-covering, 145.31; in weaving, 135.78; in mule-spinning, 127.57; in carding, 110.26; in cleaning and spreading, 98.85; in reeling, 95.26; and in throstle spinning, 93.06.

From another table, it appears that of the whole number of persons under 18 years of age, 10,541 were children under 14, of whom 5,941 were males, and 4,600 females. The average weekly net earnings of these children varied from 37.27 pence to 59.24 for each; and the general average was 46.35, or somewhat more than 3*s.* 10*d.*

Upon the whole number of 48,645, the proportions in the hundred were, of adults, 58.71, and of non-adults, 41.29; of males, 49.40, and of females 50.60; of adult males, 28.24, and of adult females 30.47; of males, above fourteen and under eighteen, 8.95, and of females 10.67; and of male children under fourteen, 12.21, and females, 9.46.

We present the next table as it stands, with the omission of only two of the columns, because it presents within a small space, a complete view of the principal branches of the business of cotton-working, and of the sex, age, and actual earnings of all the various descriptions of operatives by whom they are carried on. It is founded, like the other tables already noticed, upon the returns from the 151 mills:—

Denomination of process in which employed.	Class of operatives.	Classification as respects sex and age.	Total number of persons employed	Average number of hours worked by each person employed each.	Average Net Earnings of each individual calculated for sixty-nine hours
					Pence.
Carding	Carders or overlookers	Male adults	676	275.2	227.06
	Lookers-on Piecers	Principal female adults	540	275.8	225.98
	Feeders to frame tenters	Do.	915	270.4	80.34
	Drawing tenders	Do.	1,331	273.6	9.76
	Overlookers	Do. adults	145	273.9	350.35
Mule-spinning	Spinners	Male and female adults, but principally the former	2,757	275.3	307.91
	Piecers	Male adults	5,103	274.4	64.73
		Female adults, but principally the latter	1,189	272.6	34.68
		Male and female non-adults	1,417	272.6	26.31
	Scavengers	Male adults	112	272.8	69.30
	Overlookers	Principally male adults	49	273.0	315.36
	Slubbers	Male and female adults, male	842	270.0	147.80
	Overlookers	Principally male adults	49	273.0	315.36
	Warpers	Male and female adults, male	10,171	270.7	129.87
Weaving	Weavers	Chiefly female non-adults	8,6	270.0	133.69
	Dressers	Male adults			

From subsequent tables, however, it appears that the net earnings, both in these and in the other branches of the manufacture, vary considerably at different mills, or in different neighbourhoods. For instance, they are per week of 69 hours, in cleaning and spreading at Tintwistle, Glossop,

* It is fair, however, to state that the forms circulated by the Central Board of Commissioners (from the returns to which Dr. Mitchell's tables were drawn up) contained inquiries as to the *usual* number of hours each day during which persons above and under the age of 21 were employed in each mill, the greatest number of hours that the mill had been worked on any day in the preceding year, the total number of hours that it had been worked in the year, and a variety of other similar particulars. (See the Forms, as printed in the First Report of the Commissioners, Queries 17 to 27.) Returns to all these queries were obtained, which are preserved, although they have not been made use of by Dr. Mitchell in his summary, the variations in the working hours not being deemed by him considerable enough to affect large averages, while their insertion in the tables would have been very inconvenient. It is plain, indeed, that these returns could not have afforded the information which is the peculiar distinction of Mr. Stanway's tables.

&c., (where none but adults are employed in this department) so high as 267.69 pence; at Stockport and Heaton Morris, 174.14; at Manchester, 84.68; and at Warrington, so low as 67.27. In throstle spinning they are at Duckenfield and Stayley Bridge 108.07 pence; at Manchester, 93.67; and at Warrington only 58.02. In roller covering they are 176.50 pence at Oldham; 145.87 at Manchester; and only 86.18 at Tintwistle, Glossop, &c. But the total average again, though still varying somewhat, is not marked by nearly the same degree of inequality; being at Hyde, Brinnington, &c., 136.28 pence; at Stockport and Heaton Norris, 132.02; at Duckenfield and Stayley Bridge, 127.39; at Oldham, 127.09; at Manchester and its immediate neighbourhood, 122.64; at Tintwistle, Glossop, &c., 120.89; at Bolton, 111.50; and at Warrington, 108.79.

It seems, at first sight, not very easy to account for two facts which these statements establish; the first, that the earnings of the same description of operatives differ so considerably in places at no great distance from each other; and the second, that the rate of earnings in different branches at one place bears so varying a proportion to its rate at another place. The two facts, indeed, to a certain extent, explain each other. If we compare, for instance, the earnings of the operatives at Duckenfield with those at Oldham, although we find that the jack frame tenters, the bobbin-frame tenters, the overlookers of mules, the scavengers, the throstle-spinners, and the weavers, make most at the former place, while those engaged in cleaning and spreading, the carders, the drawing-tenters, the mule-spinners, the piecers, the overlookers of throstles, the overlookers of looms, the warpers, the dressers, the reelers, the roller-coverers, and the engineers, mechanics, and firemen, appear to be best paid at the latter, yet the total average turns out to be very nearly the same at both places; being, as already mentioned, 127.39 pence at Duckenfield, and 127.09 pence at Oldham. Now in this way it probably happens that, taking the gains of all the members of his family together,—of himself, his wife, and his children,—an operative in a cotton factory will in general find himself much in the same circumstances at the one place as at the other. The matter is regulated by a principle of compensation, which, notwithstanding the inequalities of the separate items, produces a uniformity of result, that sufficiently satisfies the natural tendency of wages to settle at the same level in the same district and the same business.

But the question still recurs, how happens it that the inequality in the separate items is produced; that of two descriptions of operatives, for example, the average net weekly earnings of the one should be higher at Duckenfield, and those of the other higher at Oldham? The present tables do not enable us to refer to all the particulars necessary for the explanation of this circumstance; but it would probably be found that it has at least something to do with the proportions in which the different classes of operatives—children and adults, males and females—are employed in the same process at the different mills. Thus, when we find that the average weekly earnings of piecers are 74.03 pence at Oldham, and only 66.34 at Duckenfield, we may infer that a larger proportion of females and children is employed in this particular process at the latter place than at the former; and on the contrary, when we find that the average earnings of weavers are at Oldham only 125.51 pence, while at Duckenfield they are 135.17, we may infer that, in this branch, the proportion of these inferior operatives is greater at the former place than at the latter. The tables, however, as we have said, do not furnish us with the means of confirming these inferences.

There is, however, another cause, not generally attended to, which enters largely into the production of the inequalities in question; and the consideration of this particular leads us back to Mr. Cowell's preface, the most curious and important part of which is occupied in its illustration.

'Improvements in machinery in all that regards cotton-working,' Mr. Cowell remarks, 'are not stationary for a single moment. The machinery which to-day is the most perfect, becomes, to-morrow, second-rate, and very soon third rate. The cotton, in its progress from the hands of the porter of the mill, who unpacks the bale which comes from the merchant, to those of the overlooker of the mill who receives it from the spinner in the state of twist or yarn (and which is the first shape in which it becomes once more a marketable commodity) goes through a number of processes which it would be difficult to enumerate, and impossible to describe. Each of them has its peculiar system of machinery, and an improvement in that appropriated to any one of them affects directly the wages of labour in the process itself, and indirectly those in other correlate processes.'

The writer then states the following to be the principle upon which wages, or earnings, in cotton-working *by power*, depend:—'When the quantity of work executed by an operative in a given time is increased in consequence of an improvement in the machine on which he works, his remuneration *per hour* increases, his remuneration *per pound of work done*, decreases.'

This proposition would, perhaps, have been more correctly enunciated as a fact than as a principle; for the increase of the operative's remuneration *per hour* when an improvement is made in the machine on which he works, although it may be what hitherto has actually and constantly taken place, does not seem to flow as a necessary consequence from the circumstances of the case. For anything that appears, the effect might be different; the earnings of the workman, in a given time, might remain stationary notwithstanding the improvement of the machinery, or they might even be conceived to fall off.

The fact, however, that they have increased is completely made out by the calculations into which Mr. Cowell has entered. It would even seem that what is here called the principle upon which wages or earnings depend has been adopted, and is always observed, as the rule in fixing a list of prices, that is of the rates according to which the workman is to be paid. 'To illustrate,' says Mr. Cowell, 'the effect which an improvement in machinery produces on earnings, I will take an instance from the spinning department. It will hold good, *mutatis mutandis*, for every other department. The spinner is the leading and most important operative in cotton working. He is the one for whom every preliminary process (called 'the preparation,' and consisting of carding, &c. &c. &c. &c.), is performed. So much weight of prepared cotton is delivered to him, and he has to return, by a certain time, in lieu of it, a given weight of twist or yarn of a certain degree of fineness, and he is paid so much per pound for every pound that he so returns. If his work is defective in quality, the penalty falls on him: if less in quantity than the minimum fixed for a given time, he is dismissed, and an abler operative procured. The productive power of his spinning machine is accurately measured, and the rate of pay for work done decreases with (though not *as*) the increase of its productive power.'

The proof of the assertion that the rate of pay for work done does not decrease *as*, or in the same degree with, the increase of the productive power of the machine, is found in the published scales or lists of prices agreed upon by the masters and men. Of these, Mr. Cowell here gives two, the one actually in force at Manchester when he wrote, dated 5th March, 1831, and that which it had superseded, dated 20th March, 1829.

From an inspection of the first it appears that a spinner spinning twist of the fineness of 80 hanks to the pound on a mule having not more than 336 spindles, is paid at the rate of 1*d.* for every 80 hanks that he turns off; while if he spins on one having so many as 396 spindles, he is paid at the rate of 4*d* for turning off the same quantity. But the second machine turns off 33 pounds of yarn during the same time that the other is employed in turning off only 28 pounds; 336 being to 396 as 28 is to 33. Now 28 pounds at 4½*d.* gives 126 pence as the earnings made on the inferior machine, while the operative on the other earns 132 pence by the 33 pounds for which he is paid at the rate of 4*d.* per pound. He therefore on that quantity gains 6*d.* by the improved machine, the master, at the same time, saving a halfpenny upon each of the 33 pounds, or in other words, gaining 16½*d.* on the whole. And the result of the calculation would be similar if any other case were selected. Universally, 'the whole benefit arising from the improvement,' says Mr. Cowell, 'is divided between the master and the operative. Both the profits of the one, and the earnings of the other, are instantaneously increased by it.'

It is admitted, however, that in the case that has been supposed, 'the spinner does not appropriate the whole of the surplus 6*d.*; that in consequence of the increased magnitude of his machine, he requires additional juvenile aid, the payment for which is at his own private cost, and absorbs a part of his apparent gain.'

The consideration of this objection introduces certain

views as to the general effects produced by the application of machinery in manufactures, which are of the greatest interest and importance.

It is quite true that when the productive power of the mule is increased in the ratio of 336 to 396, it becomes necessary for the spinner to have a greater number of assistants or piecers. These are principally boys and girls. It is evident, therefore, that the first effect of the improvement is the substitution of labour, comparatively unskilled, for that which is more skilled.

If the process were to stop here, the improvement would necessarily be prejudicial to the more skilled labourers, or the spinners, properly so called. A smaller number of them would be required to produce the same quantity of yarn; some would be thrown out of employment; and this state of things would occasion a general reduction of wages.

But the improvement fortunately operates also at the same time in another direction, and thereby provides a complete corrective for this evil. By reducing the cost of production, it enables the manufacturer to offer his goods to the public at a lower price than before; this extends their consumption; the increased demand takes off an increased supply; a larger quantity is manufactured; additional mules are set up; and these require additional spinners. In this way all those whom the improvement - enabling the former quantity to be produced by a smaller number of hands—has, in the first instance displaced, are re-absorbed, and find employment at the new mules.

The entire re-adjustment, therefore, is as follows. The number of adult operatives employed is the same as before. The number of boys and girls employed is greater than before. The earnings of the adult operatives are augmented; and they have the additional advantage of more employment being provided for the younger members of their families. At the same time, the public are supplied with the manufactured goods at lower prices than before. And finally, the profits of the manufacturer are also increased. But in the case above supposed, the 16½*d* which he gains while the operative gains 6*d*., is distributed into three portions, only one of which finds its way into his own pocket. One part of it goes to repay the outlay that has been undergone in the erection of the new machinery; another part is given to the public in the diminution of the former price of the article; the remainder only is the manufacturer's real profit. The relative proportions of these three parts must vary with circumstances. It is only necessary in all cases to the success of the operation, that after the deduction of the first (which is of course of definite amount), there should be a remainder, however small, to form the second and the third.

Such is the benefit diffused in all directions by an improvement in machinery. Such an improvement is, in truth, essentially a boon conferred on mankind of the same nature as would be a more generally plentiful supply sent down directly from heaven of any of those things which are prized as being among the accommodations of human existence. A certain amount of labour has hitherto been required to produce a certain quantity of some article of this description. By the application of machinery, or the improvement of that already in use, the same quantity of labour is enabled to produce twice as much of the article as before. Is not the world the richer on this account? Is not the general advantage that is gained the same, at least in its first effect as would follow from such an alteration of the laws of nature as should cause the additional supply to be showered down upon us from the clouds?

In its whole operation the improved machinery is far the greater blessing of the two. The shower from heaven would only displace human labour; the improvement in machinery, as we have seen, provides for the re-absorption of all the labour it displaces. In the cotton manufacture it has at least hitherto constantly done so. Mr. Cowell, indeed, admits that "if any check were given to the cotton manufacture, nay, if its continual expansion shall not prove sufficiently great to re absorb those adults whom it is continually casting out, then the improvements in machinery might be said to have a tendency to lower wages;" and "could we suppose," he adds, "that machinery were suddenly to reach a degree of perfection which dispensed altogether with adult labour, while no greater number of adolescents and children than are at present employed would be required for turning off the quantity of work now executed, it is clear that the adults would be forced to compete with children in the labour market, and that their earnings would be regulated by those of children." Nothing of this kind, however, has yet taken place, or in the nature of things can be expected to take place. "Fortunately," proceeds the writer, "for the state of society in the cotton districts of England, the improvements in machinery are gradual, or at any rate, brought very gradually into general use. Hence the fall in the price of the manufactured article is gradual, and the extension of the demand for it arising from the decrease of price, bringing it continually within the range of the means of greater numbers of consumers is likewise gradual, and keeps up the demand for adult labour, and thus counteracts the effect of the improvements of machinery which operate to displace it. Hence no diminution of earnings for adults has thus far arisen."

In order to meet directly the objection taken to the estimate of the spinner's increased gains on the ground that he has to employ and pay a greater number of assistants when the productive power of his mule is increased, Mr. Cowell goes into a minute examination of a variety of cases which afford the means of comparing the condition of the operative before such a change, with his condition subsequent to it. Of these it will be sufficient to give the following. It is admitted that, to a certain extent, the objection is founded in fact. In the case supposed above, the spinner will not appropriate the whole of the additional 6*d*. which he receives in a given time, on exchanging a mule of the power of 336 for one of the power of 396; but it is asserted that his net earnings will still be much increased.

"In the year 1833," says Mr. Cowell, "in two fine spinning-mills at Manchester, which I need not name, and while I was in the town, a spinner could produce 16 pounds of yarn of the fineness of 200 hanks to the pound, from mules of the productive fertility of 300 to 324, working them 69 hours; and the quantity that he turned off in 69 hours more frequently exceeded 16 pounds than fell short of it. These very mules were being replaced by others of double power while I was at Manchester. Let us examine the effect on the spinner's earnings. In the early part of last year, he produced 16 pounds of yarn of number 200, from mules of the power of 300 to 324 spindles. Consulting the list of prices, I perceive that in May he was paid 3*s*. 6*d*. a pound; this gives 51*s*. for his gross receipts, out of which he had to pay (I will put the amount high) 13*s*. for assistants. This leaves him with 41*s*. earnings. His mules have their productive fertility doubled; they are converted into ones of the power of 648. He is now paid 2*s*. 5*d*. a pound instead of 3*s*. 6*d*.; but he produces 32 pounds of yarn of the fineness of 200 hanks to the pound in 69 hours. His gross receipts are immediately raised to 77*s*. 4*d*. I will now admit that he requires *five* assistants to help him, and, averaging their cost at 5*s*. a piece, their labour will cost him 25*s*., and to avoid all cavil, I will add 2*s*. extra. Then, deducting 27*s*. from his gross receipts, there remains a sum of 50*s*. 4*d*. for his net earnings for 69 hours' work, instead of 41*s*."

It is added in a note that, from information since received of the actual working of a pair of mules spinning No. 200, and carrying 360 spindles each mule, the amount of the spinner's additional earnings, in consequence of the improvement, appears to have been underrated in the above calculation.

We quite agree with the writer in considering it of the utmost importance that these facts and reasonings should be made generally known among our manufacturing population, and we gladly lend our aid in their diffusion. "The misconceptions," says Mr. Cowell, "as to the real effect of machinery on the price of labour which the operatives entertain are the causes of turn-outs and strikes; they produce rankling discontent towards their masters, and I regret that I have not had the opportunity of giving them a fuller exposure. . . . If these considerations should induce operatives to hesitate before they combine and turn out against new machinery, before they again cabal for shortening the hours of work, in order to counteract the (fancied) injurious effect upon wages of improvements in machinery, and lead them to neglect the instances of those who urge them "to strike for eight hours' work, and twelve hours' earnings" (and this is the advice they have lately received) my purpose will be answered. The generality of the operatives in cotton-working are well-meaning, respectable, shrewd, and sensible; and I believe that if the real effect of machinery in augmenting the actual rate of their earnings, and in enabling a greater number of persons to benefit

by the augmented rate, could be fairly set before them, and rendered familiar to their minds, it would have a most beneficial effect upon their actions as members of society."

The remainder of the Preface is chiefly devoted to the consideration of the differences that appear to exist between the rates of wages and earnings in the cotton-manufacture both in different parts of England, and in England generally as compared with other countries. But on these difficult points Mr. Cowell acknowledges his inability to throw any well-defined and general light from the inquiries he was enabled to make during the few weeks he was engaged in investigating the subject, although he thinks that the returns he obtained from the 151 mills, if strictly analyzed, exhibiting as they do the proportions which infant, adolescent, and adult labour bear to one another in each, might afford the means of determining the limits within which the rate of payment for work done really ranges in this country. He considers it certain however that this rate, after all requisite corrections, would still be found to differ somewhat in different parts of the cotton district. As for the various statements that have been produced with the object of exhibiting a comparison between the rate of wages in England and the rate in different parts of the continent, he regards them as nearly worthless, and we think shows satisfactorily that it is impossible such a comparison can be accurately made. "When I reflect," he says, "that I was unable, with the utmost care, to form any general and well-defined conclusions concerning the rate of payment for work done in the cotton manufacture in England, or in any district, I cannot attribute much weight to the comparisons which are so confidently instituted respecting the comparative rate of wages in foreign and English cotton working. In cotton working the rates alleged to prevail abroad (putting out of consideration that they are never stated with reference to hours, but merely relate to periods comparatively vague, such as a day, a week, a month, a year) convey no information of the quantity or quality of work turned off in a given time, to realize a given sum of money. They amount, in fact, to nothing more than this, viz., that since 10*d.* is less than 2*s.* so the rate of wages in France, Belgium, Switzerland, and Germany, is lower than in England; and then by confounding the 'rate of wages' with the 'payment for work done,' it is asserted or implied that the rate of payment for work done is likewise lower abroad than at home." Add to this, that in all these estimates the capabilities of the machinery, and the proportions in which the labour of adults, of adolescents, and of children, is employed in the different manufactories, circumstances which, as we have seen, affect so materially the rates both of wages and of earnings in England, are of necessity altogether neglected. In short, the statement is founded upon a mere fragment of the case. By a judicious selection of particular cases, it would probably be equally easy to show either that wages were higher, or that they were lower in England than elsewhere, according as it suited the purpose of the person making the comparison.

We shall conclude our abstract of this interesting disquisition by noticing some of the observations it contains on the proportions in which the two sexes appear to be employed in the cotton manufacture.

According to the calculation already given, it appears that of the whole number of operatives employed in cotton factories in England, the males under eighteen amount to 42,745, and the females under the same age only to 40,512.

It has been ascertained, Mr. Cowell remarks, that instead of the labour of males up to the age of eighteen costing more money than that of females up to that age, the case is precisely the reverse. "The value of the labour of a female up to that age is greater than that of a male, for their strength and activity is as great as is requisite for the work to be performed, and they are more docile and obedient. It consequently costs more." It is also to be remembered that "the superior demand upon females as domestic servants to that upon males in early life, will account in part for their obtaining higher wages in factories than males during that period."

Up to a certain age (somewhere between nineteen and twenty-two for both sexes) the earnings of operatives in factories, Mr. Cowell conceives, keep pace with their age. That is to say, in general all those of the same age and sex earn about the same amount. By the age of nineteen or twenty the operative "has passed through all the successive stages, and acquired all the elements of future skill. Accident then determines his future destiny and earnings."

"The principle," the writer continues, "which subsequently determines the differences of earnings realizable by adult males and females in cotton working, (as far as the state of things in the Lancashire district is concerned,) is, not that female labour costs less money than male labour, and that the master always takes it *in consequence*, but is this, viz., that adult males are fit for *every* species of occupation *in* factories requiring adults, while adult females are only fit for *some* occupations and not others in factories. Thus, a woman can spin, and many do, but she is not so capable of managing two mules as a man is; and consequently spinning by females has been on the decrease in the Lancashire district." A change in machinery, however, it is added, might bring them back to this occupation to-morrow. For all occupations, on the other hand, in which males and females are equally capable of engaging, there is a surplus of female labourers; and this surplus would be still greater were it not controlled by marriage, which, by confining females to their own houses, takes them out of the labour market. The greatest field for the employment of adult females, and that upon which the mass of them are thrown, is that of the power-loom weaving department for coarse goods; and the earnings of the females in general seemed to Mr. Cowell to be regulated by those prevalent in this department, which never mount higher than 16*s.* a week.

Mr. Cowell, in conclusion, expresses himself anxious that his observations should be understood as applying solely to what he saw himself in the Lancashire district. "I would not venture," he says, "to hazard any opinion concerning a different state of things, as in Scotland, Preston, Belper, or elsewhere. I should expect, *à priori*, that in Scotland females were more extensively employed in cotton-working than males, judging from what I understand to be the average quality of work done there in spinning, and the quality of the goods woven, but I should not be surprised at finding such an expectation erroneous. The counts spun in Scotland are of a higher average, I understand, than those spun in England, though they do not approach there to the finest Manchester spinning: hence I should infer that the average of their machinery was intermediate between that used for 'coarse' and that used for "fine spinning." If so, the spinner need not possess the physical strength of a Lancashire *coarse* spinner, nor the steady and perfect skill of a Manchester *fine* spinner, hence I should infer that women were more in demand as spinners in Scotland than in Lancashire." This conjecture, it may be remembered, has been verified by the returns forming the foundation of Dr. Mitchell's Tables, from which it appears that in the cotton factories of Glasgow and the neighbourhood the females are to the males as 160 to 100. It may, however, be doubted if either Dr. Mitchell or Mr. Cowell has assigned the fact to its true cause. The author of the tract entitled 'Trades Unions and Strikes' accounts for it in a way different from both. It is explained, he conceives, by the effects of the Cotton-Spinners' Union in Scotland, and the greater violence and ferocity which the Scottish workmen have shown in their strikes than the Lancashire people, in consequence of which the manufacturers in Scotland have had machines made expressly for women, and have used all their endeavours to carry on business without the assistance of men.

We have now finished our review of what may be called, by way of distinction, the Arithmetical Statistics of the British Cotton Manufacture. The moral statistics of the subject—embracing, among other matters, the state of education among the operatives, and the policy of any legislative interference with the hours of labour—we cannot now enter upon. This great and most important branch of the investigation, indeed, would be most conveniently treated in the form of an inquiry into the condition of our manufacturing population generally; and in that form we may probably take it up on a future occasion. The various reports of the factory commissioners and inspectors furnish ample materials for such a survey; but extending as they do to many thousands of pages, it would be no easy task to reduce the vast mass of information supplied by these voluminous and undigested documents to an orderly arrangement, and to present an abstract of it within any reasonable compass. The value of these reports, however, as throwing a flood of light upon, by far, the most interesting questions that belong to the domestic politics of

the times in which we live, can scarcely be overrated; and we wish that what is most material in them were given to the public in a more popular and accessible form. Compared with the phenomena attending the rapid extension of our manufacturing industry, all the other subjects of political speculation connected with these kingdoms dwindle into insignificance. Mr. Rickards, the inspector of the Yorkshire and Lancashire district, in a report addressed to Lord Duncannon, and lately published, has drawn in a few words a striking picture of the dangers threatened by that plethora of our social system which has been thus induced, unless the necessary precautions shall be taken. 'In regarding,' he observes, 'the population of what is commonly called the principal manufacturing district, we are forcibly struck with its vast importance in a national point of view; its condensation within limited spots; its consequent means of free intercommunication; the intelligence, energy, and activity of many of its members, with the coarse low habits of the general mass; from the want of sound moral and religious education, the slaves of vice, prejudice, and passion; easily excited by factious clamour as to real or supposed grievances; and formidable in all such cases from their numerical and united strength; the bond of union between masters and servants feebly knit, and resembling more the animosity of adverse interests, than the salutary influence of the one class, with satisfied subordination on the part of the other. Such is the apparent state of the manufacturing population of these parts; a population where the vicious propensities of the many keep pace with their augmented means of gratification (drunkenness, it is said, being greatly on the increase); a population, therefore, peculiarly fitted to be the instruments of seditious incendiaries, and whose means of organized association are too well known to be highly estimated. Of the state and circumstances of such a people it is of no small importance that his Majesty's Government should be at all times minutely advised; and more especially as the probability of increased commercial intercourse with the world at large, particularly with the East, justifies our confidence in a great extension of demand for the manufactures of these districts, consequently, for increased numbers of the same description of working hands, and with them a wider spread and more formidable array of those habits and propensities which may render them as dangerous on the one hand to the peace of society, as their labour on the other may, under due regulation, conduce to its advantage.'

These observations are of course not to be understood as implying that our manufacturing population either has become, or must become, more dangerous in proportion to the increase of its numbers. We believe the fact to be, that its intelligence has made a still greater progress than its numerical amount, and that the manufacturing population of 1834, for instance, is much less depraved and violent than that of 1817 or 1822. Still the mere increase of numbers, looked to by itself, must always be regarded as in so far an element of danger, so long as there remains anything whatever combustible in the mass—any of those tendencies which Mr. Rickards describes, and which, it will hardly be denied, do still to some extent, whatever it may be, characterize the population in question. In so far as they are ill-disposed, or are liable to be perverted and misled, their increased numbers certainly make them more formidable.

Vigilance, however, rather than interference, is here, as in most other cases, the true part of the Government. Our manufacturing system has now become one of the great foundations of the national wealth; that is to say, not only the strength of the empire, but the bread and the existence of millions of our population depend on it. An act of legislation, or any other cause, which should strike it with either total or partial paralysis—which should impair its natural energies and capacities of life and expansion—would derange the whole social economy of the country, and, if not by a sudden catastrophe, would, by a slower but equally sure blight, arrest and affect with a mortal shock the prosperity of all classes among us. Even the best intentions must not be suffered to intermeddle with such mighty interests as are here concerned, unless in the spirit of the deepest caution, and under the guidance of the amplest information and the clearest views. There are some persons whose hostility is particularly directed against the highest processes of the cotton manufacture, or who, thinking it a little thing to destroy, if such should be the result of their experiments, what they probably regard as merely the hotbed shoots superinduced upon its natural growth, would begin by restraining it in that direction. This description of intermeddlers are perhaps the most pernicious of all others. 'The fine-spinning mills,' remarks Mr. Tufnell, one of the commissioners for the Lancashire district, 'are, scientifically speaking, the glory of Manchester. Nothing can exceed the beauty, delicacy, and ingenuity of the machinery, the order in which it is kept, or the extraordinary results it is capable of producing. I have seen cotton spun in them of the number 350; in other words, a pound of cotton is stretched to the incredible length of 294,000 yards, or 167 miles, and is then sold for 25 guineas, the original cost of it having been 3*s.* 8*d.* It is the only part, too, of the cotton trade in which England is absolutely unrivalled, as, with the exception of some attempts that have been made in France, no other nation can approach us in this department of manufacturing. The export of fine yarn is increasing more rapidly than of any other description of cotton goods. It is impossible to keep the coarse spinning-mills in the same order as the fine, owing to the greater dust occasioned by the work, and the machinery not being required of equal delicacy. They have, however, other peculiarities which make them at least as worthy of attention. For instance, there is not unfrequently attached to them a department for power-looms, which are among the most extraordinary machines in a factory. I have stood by one of these looms, and minuted its operations with a watch, when I have seen it weave seventy-two square inches of cloth in a minute, without any human being attending to it. In factories thus furnished the cotton enters in a raw state, and comes out as cloth; and of the numerous machines through which it has to pass, including the steam-engine which moves them all, there is not one that does not seem to demand the utmost stretch of human ingenuity to bring it to its present state—not one that does not condense in its formation the result of at least 100 patents, or that has not required in its invention the united efforts of at least 100 minds. Yet this is the manufacture—a manufacture which comprises the most perfect and beautiful specimens of human art, and which employs 15,000,000*l.* of our capital, and the shipping of half the kingdom—of which the very existence is to be compromised by the indulgence of a mistaken philanthropy.'

POLICE OF THE METROPOLIS.

The present Report of a Select Committee of the House of Commons on the Police of the Metropolis, is dated 13th August, 1834, and is the last of a series of similar documents, to several of which we have already referred in the 'Companion.' The committee state that they "have considered themselves re-appointed to continue and complete the inquiry commenced in the previous Session of Parliament;" and in the fulfilment of their duty they have adopted the suggestions of former committees, with a view to the completion of an inquiry which, though not directed to precisely the same objects, has been carried on at intervals during sixty years.

The principal conclusion to which the committee have come, is that of a decided approbation of the new system of police. When we remember the strong prejudices which had to be overcome in the formation of this force, and the aversion with which it was at first regarded by many, we cannot but be satisfied that it is working well, to produce in so short a time so strong a reaction in its favour. The great majority of the witnesses who appeared before the committee express their decided conviction of its usefulness and efficiency. The state of things under the old system is thus characterized in the Report:—"The police was roused into earnest action only as some flagrant violation of the public peace, or some deep injury to private individuals, impelled it into exertion: and security to persons and property was sought to be obtained, not by the activity and wholesome vigour of a preventive police, which it is a paramount duty of the state to provide, but by resorting from time to time, as an occasional increase of the more violent breaches of the law demanded it, to the highest and ultimate penalties of that law, in the hope of checking the more desperate offenders." "The nuisance of West End Fair," says Mr. Wray, the Receiver of the Metropolitan Police, and one of the witnesses examined by the committee, "is within the recollection of most persons; and yet it will hardly be credited that within seven years or so, on the occasion of that fair,

people were robbed in open day, and females stripped of their clothes and tied to gates by the road side, the existing police being set at defiance. In St. Giles, Covent Garden, and Holborn, the streets exhibited on Sunday morning scenes of most disgraceful drunkenness and depravity, and which the old parochial authorities in vain endeavoured to repress. Among the old watchmen it was hardly possible to assemble a number sufficient to disperse a regular mob, and in no case were their efforts directed beyond the boundaries of their own parish." The necessity that existed for some alteration in our police system had long been evident; and if, therefore, it can be shown that in the decrease of crime, and in the minor but still important consideration of economy, much has been already gained by the new police, any objections which may still exist, will not point towards the system itself, but to such defects as the very short experience of its working has not yet enabled those under whose control it is to rectify.

The first and last years in which the new metropolitan police was in complete operation, were 1831 and 1833. The following table presents a comparative view of the number of persons apprehended for offences in the metropolis in these two years:—

Crimes.	1831.	1833.	Increase.	Decrease.	Per cent.
Common assaults	3,426	5,121	1,695	. .	50
Common larceny	6,953	7,862	899	. .	13
Burglary . .	133	104	. .	29	22
Larceny in dwelling houses	866	195	. .	671	77

From this statement it appears, as the committee remark, "that the more violent offences have already decreased, while the detection of the lighter offences has increased, which is precisely what was to be expected from a good system of preventive police. It is to be observed that, with reference to burglary and stealing from dwelling-houses, inasmuch as more preparation and more time is required for the perpetration of these offences, the parties attempting them are more likely to be of that class known to the police, who would therefore observe and progressively impede their operations. In other words, a good preventive police may directly check the commission of such crimes, and the number apprehended would therefore be less; but the case is different as to lighter offences, such as assaults, usually committed in the heat of the moment, and common larcenies, which may be committed by persons not previously known to be of bad character, and which can be effected in a moment, as by snatching any small article exposed in the street. It is obvious that it can seldom be in the power of the police, however vigilant it may be, by direct means to prevent the commission of such offences, and that it can only operate indirectly in producing this result by increasing the chances of detection, and thus bringing the fear of punishment to bear more immediately upon the minds of those who are disposed to break the law."

In addition to these considerations, it is also to be remarked, that the increase of apprehensions for common assaults and other minor offences may probably indicate no increase in the offences themselves, but only an increase in the vigilance of the police. The police here appears in the light in which it ought always to be considered, chiefly a preventive body, not merely detecting offenders, but opposing serious obstacles to the commission of crime. This is attributed to "the plan now systematically established, of maintaining a police in every respect the same, throughout the twenty-four hours, by which difficulties are presented as well to the planning of the robbery by day as to its execution by night."

The most obvious advantage in the new system of police—indeed that which gives it all its superiority and efficiency—is the concentration of its government and control under one responsible head or Board of Commissioners. The old system was divided into a great number of separate and independent jurisdictions, which frequently came into collision with each other, and frustrated the ends of justice. The new system has only been gradually coming into operation. It has been extended cautiously from a smaller to a larger field of operation, as experience seemed to point out its utility. A gentleman whose name is not given, but who states that for thirty years he has bestowed considerable attention on the subject of police generally, and who claims the merit of having been the original suggester to Lord Sidmouth of the plan which was afterwards adopted by Sir Robert Peel, observes, "Under the old police each separate office had, as it were, a separate jurisdiction, and the officers of each office seemed to feel a degree of jealousy towards each other, which I think was often productive of mischief in the attainment of justice or the prevention of crime; and I am inclined to think that a good deal of that description of jealousy has existed up to a very recent period, and that it very often happens that police officers of the old establishment, who remain connected with the different offices, are rather disposed to throw impediments in the way of the success of the new police in the pursuit of a criminal, or the discovery of crime, than to render them assistance, and that for the obvious reason, that jealousies will necessarily exist in the existence of two systems; those who have been longest in the performance of the duties, considering that they know much more than those who have recently come into similar duties, and being jealous of individuals taking from them the credit which long experience induces them to believe they deserve." On being asked if such cases had come under his own observation, he replies, "I have seen old offenders brought to the bar of a police office, and known old officers to be present when those persons were brought up as known bad characters, as reputed thieves, and those officers have evinced a disinclination to give evidence which would have assisted the new police in relieving the public from the imposition of these persons." He afterwards adds, "Until the new police acquire a knowledge of these characters, they cannot perform their duty with that degree of strictness and effect which they would do if they had acquired a knowledge of the men with whom they had to deal." The jealousy thus stated to exist, however, is affirmed, by two magistrates who were conjointly examined, to be very much on the decline. Mr. Serjeant Arabin, whose situation as judge at the Old Bailey gives him ample opportunity for forming an opinion, speaks in the most decided tone as to the manifest improvement of the new body over the old. He is corroborated by a number of magistrates, who all concur in declaring that the men composing the new force are, generally speaking, more active, more honest, and more intelligent than those who composed the old watch; and that in their general deportment, and in the clearness with which they communicate their evidence in cases of trial, the superiority is striking, and of the highest public benefit.

It appears that one serious description of crimes, that of the coining of base money, has increased since the establishment of the new police, and that offenders of this line are also more numerous than they were formerly within the district over which the jurisdiction of the metropolitan police commissioners extends. Upon this head, however, it is admitted by Mr. Field, an Inspector of the Mint, that 'there are many of the old officers who have been in the service all their lives, who are not aware of particular parts of the offence,' it being a peculiar one, and requiring skill and care in bringing home the charge; and that the failures of the metropolitan police are probably owing to the want of experience. We cannot conclude this part of the subject without extracting a passage from the evidence which is highly honourable to the commissioners, and shows that they take an enlightened, sound, and judicious view of the nature of their duties. Mr. Mayne, one of the commissioners, being asked, "Have you not reason to suspect that an objection is taken to your mode of managing the discovery of Mint cases; that you do not afford the facility for detecting the offenders by giving encouragement to their proceedings until they have completed the offence?" replies, "We conceive it is a sounder principle, *even of police*, to detect crimes in the earliest stage, rather than allow parties to go on until they commit a more serious or capital offence; for although you may perhaps in that way get rid of the individuals by having them hanged, yet we think, as soon as there is evidence against them for any offence, however slight, that they should then be proceeded against. By this system we are aware that, in some cases, those who are otherwise known to be very bad offenders may escape with less punishment than they deserve, yet we do not consider ourselves justified in waiting until they have the opportunity of committing a more serious crime.' This is quite in accordance with the sentiments of the Committee of the House of Commons, which was appointed last year to inquire into a system of espionage alleged to exist in the management of the new police. In their report, which is

printed in the appendix to that before us, they solemnly "deprecate any approach to the employment of spies, in the ordinary acceptance of the term, as a practice most abhorrent to the feelings of the people, and most alien to the spirit of the constitution."

Many complaints were brought before the committee respecting the increased expense to parishes of the new police, as compared with the old watch. But it is to be observed in comparing the expense of the old watch with that of the new police, that many of the parishes now enjoying the services of the latter force were previously only partially watched, and many others were not watched at all. A return which was ordered to be printed by the House of Commons in 1831, of the expense of the nightly watch for the year preceding the establishment of the metropolitan police, distinguishes those parishes that were but partially watched and those not watched at all. Another return shows the amount levied in 1831, on all and each of the parishes for the maintenance of the metropolitan police. The average increase of the amount so levied is found to be twenty-one per cent. above the expense for the old watch in those parishes that were wholly watched. Twenty-one per cent., therefore, deducted from the amount now levied for the police on the parishes which were formerly partially watched, or not watched at all, will give the sum which the old watch would have cost in these parishes, if maintained at the same rate as it was in those that were wholly watched; and if we deduct from that sum so much as was expended in the places partially watched, we shall have the addition to be made on account of the new police to the total amount expended by the parishes for the old watch. The account will then stand thus:—

Amount now levied for the police from the parishes within the district .	£206,883	15	8
Amount of expenditure for the old watch, including the estimate for parishes which had no watch, or only a partial one . . .	163,112	2	10
Estimated amount of increased charge to the parishes for the police previous to the parliamentary grant, in 1833, of 60,000*l.* . . .	43,416	12	10
	£206,888	15	8

This is Colonel Rowan's estimate; and if the increase of expense be no greater than it thus appears to be, it is probably much more than balanced by the amount of property annually saved through the diminution of robberies and burglaries. Mr. Colquhoun, in his work on the Police of the Metropolis, estimates the loss arising from the burglaries, highway robberies, and small thefts, in London alone, at the enormous sum of 990,000*l.* The losses arising from the same causes in 1833, were under 20,000*l.* Mr. Colquhoun's estimate is doubtless exaggerated, though he deliberately adhered to it in subsequent editions of his work; and the great improvements introduced in the lapse of thirty years must necessarily be taken into account in determining the share of merit in the protection of property and prevention of crime to which the new system may lay claim.

Were the various police establishments of the metropolis all put under one directing and controlling authority, the saving which would thereby be effected would considerably diminish the expense to which the public is at present subjected for the maintenance of these several bodies. For instance, the city of London has a distinct police establishment of its own. This establishment has been recently very much improved; and Mr. Woodthorpe, the town-clerk of the corporation, gave in the following account of its expense:—

The day police for the year 1832 cost .	£.9,006	2	6
The nightly watch for the year 1831 cost .	36,201	2	7
	£.45,207	5	1

The commissioners propose to execute the same duties for the sum of 24,650*l.*, thus effecting a saving of upwards of 20,000*l.*

The mode in which parishes are rated for the support of the New Police, has been much misunderstood, and was a fertile topic of complaint on the part of many of the witnesses examined. It is thus explained by the Committee: 'The sum contributed by each parish towards the expenses of the police, or the police-rate, is founded on the assessment of each parish to the county-rate, and is calculated so as not to exceed 8*d.* in the pound upon the last county assessment. But the sum thus calculated is paid out of the poor-rate, which is founded in most parishes on arbitrary valuations of property, varying in different parishes of the same county; and it frequently happens that a sum, only equal to 8*d.* in the pound in the county assessment, will require 10*d.* or 1*s.* in the pound upon the parish valuation, which governs the payment of the poor-rate. Hence, as will be seen by the evidence, many of the parishes have supposed, looking only at their own valuation, that the sum demanded for the police is beyond the maximum rate of 8*d.* allowed by law.' The different rules observed in different parishes for determining what property is to be rated to the respective funds of the parish and the county, and how it is to be rated, certainly produce much confusion and irregularity, and the matter calls for the interference of the legislature. Disputes arising from this source already interfere seriously with the efficiency of the police system. It appears from the newspapers that the refusal of the overseers of one parish to collect the police rate has lately led to the withdrawal of the police and the shutting up of the station-house. 'As the matter now stands,' says Mr. Wray, in his evidence before the Committee, 'it is extremely inconvenient. There is a considerable power under the act of Parliament of levying by distress upon the goods and chattels of the overseers, or of the persons that belong to the select vestries, but it is a sort of power that almost defeats itself, and can seldom be carried into effect. We have upon one occasion proceeded against overseers, and received the money; but it seems a great hardship that those persons who often have not the money under their control, should be made personally liable for that which is not, in point of fact, their fault, frequently arising from disputes in the parish. We have a right to take possession of the goods and chattels of any member of the select vestry, but it is a sort of remedy that we could not make use of, without creating a feeling of its being an act of great oppression.'

Complaints were also brought against the New Police Force by various witnesses, on account of the reluctance of the men to interfere in cases of disturbance and disorderly conduct in public-houses, not involving the commission of any criminal offence, and in cases of assault where the act has not been witnessed by the constable, or the party assaulted does not bear visible marks of the aggression. 'Many persons,' observe the Committee, 'have assumed, and that assumption has been countenanced by the report of the Select Committee of 1822, that a good police could only be attained at the expense of the liberty of the subject, and that it necessarily involved some arbitrary principle, opposed to the free constitution of this country. In the words of that report, it was 'difficult to reconcile an effective system of police with that perfect freedom of action and exemption from interference which are the great privileges and blessings of society in this country. A full consideration of the evidence now presented to the House will dispel this apprehension; and looking at the establishment as a whole, it appears to your Committee that the metropolitan police has imposed no restraint, either upon public bodies or individuals, which is not entirely consistent with the fullest practical exercise of every civil privilege, and with the most unrestrained intercourse of private society.'

The following is a list of the different police establishments which still exist in the metropolis, in addition to the New Police:—

Bow Street, including the Horse Patrol.
Marlborough Street.
Hatton Garden.
Worship Street.
Lambeth Street.
High Street, Marylebone.
Queen Square.
Union Hall.
Thames Police.
City of London Police.

The Committee do not speak positively with respe[ct] the benefit likely to be derived from the union of all [the] bodies under one controlling head; but they speak d[ecidedly] and in regard to a few of them, and leave the others [to] ther investigation and consideration. The Fin[ance] mittee of 1798, when reporting on the expens[e] quality only from ality of his

of certain branches of police, say, 'It would be unfortunate, indeed, if any local jealousies, founded upon no just grounds, though entertained by very honourable minds, should continue to deprive even the inhabitants of the city itself, as well as those of the rest of the metropolis, of that security which a more permanent attendance, and a perfect intercommunity of jurisdiction in criminal matters, between magistrates in every part of the metropolis and of the four adjoining counties, could not fail to produce.' The Committee, therefore, for the purpose of ensuring that system of subordination and discipline which mainly depends upon obedience to a single and responsible superintending authority, and without which the metropolitan police can never be completely effectual, propose that the immediate general control over the constabulary force should be vested in the Commissioners. These gentlemen devote their entire time to the performance of their duties. Acting immediately under the Home Secretary of State, their business is to superintend, in the larger sense of the word, all the movements of the body under their control, to guide its operations, to provide for the security of the citizens, to attend to its financial details—in fact, to be responsible for all that comes within their department: they are ministers of police. In vesting them with their extensive powers, it is not proposed to curtail by law the powers which the magistrates of the several police offices possess as justices of the peace, or to define the exact boundaries by which the power of the Police Commissioners is to be separated from that of the police magistrates. It is thought that through the intervention of the Secretary of State, an understanding could be come to, sufficient for all practical purposes, by virtue of which the general control over the constabulary force may be reserved to those who are exclusively responsible for its order, good conduct, and efficiency, as a disciplined body. Many evils are proved to result from the distinct and separate jurisdictions of the police forces. In November, 1830, when the king intended to go into the city, and great and general disturbance took place in many parts of London in the evening, the metropolitan police prevented any assemblage of persons within their district: and when, in the night, all that were attempting to commit breaches of the peace were driven up the Strand, they assembled beyond Temple Bar, *whither the police could not follow them*. Mr. Mayne thinks that that riot would have lasted but a short time had the police been permitted to follow the rioters within the city, as the mob were actually pursued up to Temple Bar, and concentrated in Fleet Street. On occasion, also, of the fast-day riots of 1832, the police were in Finsbury Square, where a meeting was to be held; after some time, the mob began to pull up the iron railing, and throw stones at the passengers as well as at the police, when it became necessary to clear the square: this was done gradually, by the police driving the disorderly people before them, but the place being immediately on the verge of the city, the mob again assembled just across the street, within the city, and the police were kept there for some hours unable to act, and exposed to the same kind of annoyance. On this occasion several of the police were wounded.

The existence of so serious a defect in the police system of the metropolis might endanger the peace and property of the citizens in any time of public commotion, or at least render the assistance of the military necessary.

Of the suggestions offered by the Committee for the improvement of the police establishment, the principal are the consolidation of offices, such as the receivership of the city police and the receivership of the metropolitan police, into one; and the establishing of a fund for bestowing pensions on men who may have been maimed in the course of duty or lost their health by exposure to severe vicissitudes of weather. This latter improvement would hold out a strong inducement to able officers to continue in the service, and give to the Commissioners an ampler opportunity for the exercise of a strict discipline. At present, the only hold over a refractory or otherwise offending constable, except by fines, is dismissal; and from the number of resignations which are occurring of able men whom the Commissioners would have wished to retain, it is feared that this ultimate remedy is not effectual. The character which the force has to a large extent obtained may be judged of from the fact, that from its establishment up to the year 1833, a sum of 2000*l.* had been contributed by private individuals, in donations to the police, who stated their testimonies of gratitude for their services. This fund, the merit of which may be considerably augmented, and may lead to the complete abolition of what, under the old system, was considered a necessary evil, namely, the establishment of what were termed, in the cant language of the thieves, *flash houses*, where the police, intriguing with low and infamous characters, procured the restitution of stolen property for sums of money previously agreed upon.

The concluding sentence of the Report deserves to be quoted. 'Your Committee, however, do not rely upon any system of police, however perfect, for the diminution of crime, unless in connexion with an enlightened system of prison discipline and secondary punishments, and the still wider diffusion of moral and religious education, which are the great and the only means of permanently advancing the moral and social condition of the people.'

REPORT OF THE SELECT COMMITTEE ON THE SALE OF CORN.

THE following are the material passages of the Report of the Select Committee of the House of Commons, on the Sale of Corn.

. . . . . .

"The general result of the inquiries of your Committee, is, that the sale of corn is conducted upon three systems, contrary to, and, taken singly, incompatible with each other. By measure alone, by weight alone, by measure (to use the terms of the Report of the Committee of 1796) regulated by weight: or more properly speaking, by measure with a fixed weight per measure.

"There is a fourth system, namely, measure, with the actual weight per measure in each case; which is more or less adopted in all the districts where measure prevails. This last system will be found to be as perfect as the nature of things will permit, and may be adapted to either of the first two.

"The leading diversities or contrarieties above stated have been aggravated in their effects by other diversities connected with them. Thus in the districts where weight is used, it is often a tale or rate of weight different from that in use in other places where weight is used; and where measure is used, it is often a different kind of measure from that in use in other places: and different multiples of the same measure are used in different places.

"Sometimes all the above contrary systems, and sometimes several of the above species of diversity, exist in the same place, as at Liverpool, Bristol, and Glasgow.

"The principal evil is that which results from the use of contrary systems. for instance, corn may be bought in one place by weight, to be sold in another place by measure, which systems not being reducible into each other, from the want of a common point of relation, it is impossible to determine at what rate such corn should be sold, without the application of both of them combined, as will be hereafter shown. The same cause leads to constant disputes and misunderstandings, such as would occur in the commercial intercourse of men ignorant of each other's language.

"Owing to the dealings of different parts of the country being carried on by weight in one part, and by measure in another, it is sometimes thought necessary, in case of dispute, or apprehension of dispute, to weigh the whole, as well as to measure the whole, of a cargo of corn, in order that the result may be compared with that made out at the place where the cargo is shipped. In consequence of this, the labour of discharging the cargo is greatly increased. Of the evils produced by the diversities of the respective systems, the most general one is the occasional confusion experienced in the conduct of their business by persons whose skill does not enable them to calculate readily. There is, however, one evil of widely mischievous effect, which all the above enumerated contrarieties and diversities combine to produce; the *quotations* in the public prints of the *prices of corn* in the different markets of the kingdom, are thereby rendered unintelligible, and in a great degree useless. As the quotations are the only means within the reach of the farmer or small dealer, of learning the state of the markets, they become a matter of very general importance to that class of persons. The merchant and the large dealer having the benefit of extensive correspondence with persons engaged in the trade throughout the kingdom, do not so much require them.

"The value of a commodity being dependent on the state

of the supply and demand, and the value of different commodities also influencing the value of each other, all people are more or less interested in obtaining good information respecting them. Information of the state of the market in one district is not sufficient, for the state of that market may depend upon peculiar locality, as well as upon the general state of other markets: it is necessary therefore that the information should include all the markets that may influence each other. The facility of transit which now exists would bring most of the markets of the kingdom within this rule; for though some of them may not operate directly upon the particular market, the state of which it might be required to know in any case, yet as they do operate upon others which exercise an influence in that direction, they ought not to be left out of view.

"It is requisite in all cases that the statement of the quotations should be intelligible, and the points of comparison exhibited in parallel, so that the calculations and inferences deducible from them may be readily obtained.

"The quantities should be expressed in the same terms, and if the variations of price arise from any other cause than the state of the market, that cause should be indicated.

"Let these rules be applied to the commodity corn, and it will be found that the quantities are expressed in different terms; that the statements of price also vary accordingly; and that the variations of price on account of difference of quality are not stated at all. In short, none of the conditions of a good quotation are complied with under the present system.

. . . . . .

"To adjust and to prevent the recurrence of the existing diversities, it has been proposed, that the uniform standard to be established throughout the country, should be, 1. Measure alone. 2. Weight alone. 3. Measure combined with a fixed weight per measure, for each species of corn. 4. Measure combined with the description of the actual weight of corn per a given measure in the particular case.

"But, first of all, it must be assumed, that whatever standard may be prescribed by the legislature, it is to be good in itself, especially adapted to the subject, and complete.

"In the sale of corn, which is the subject, measure is not complete: weight is not complete: measure regulated by a scale of weights is not complete, measure combined with the description of the actual weight per measure, is complete.

"In the sale of corn, the object of the standard is twofold, to check the quantity and to give the quality: and, by a reference to the quotations of prices in other markets, to find the value.

"Measure alone will check the quantity; but it will not give the quality.

"Weight alone will check the quantity, but it will not give the quality.

"Measure combined with a fixed weight per measure will give the quantity; but not the quality.

"Measure combined with a description of the weight per measure, in the particular case, gives both the quantity and the quality.

"The quality of the corn must be ascertained in order to find the value. The quality, upon which depends the value, in respect of one parcel of corn in comparison with other parcels of corn, under the same state of supply and demand, is determined by the proportion of the bran to the flour. The bran and the flour exist in certain proportions in the corn, and the flour is of a certain degree of fineness, according to the total weight of a given measure of that parcel of corn, compared with the total weight of the same given measure of the same species of corn in general. Besides, more flour is produced from corn of greater specific gravity, and more bread is produced from such flour than from inferior corn, or inferior flour.

"These two ingredients, the weight and measure, are indispensable, then, to give the quality, on which the value or price chiefly depends.

"It has been said that weight and measure will not give the condition, and that the value depends a so upon condition; and that as the combination of measure with the description of the weight per measure does not give condition, it is incomplete, and at best a partial remedy. To estimate the value of this objection, condition and quality must be distinguished: quality implies the inherent properties of the corn—condition its accidental state. If corn be in good condition, then measure, combined with the description of the weight per measure, gives the quality of it; if it be in bad condition, then also the combination gives the quality of it, as compared with other corn in the same condition. But in the latter case, its condition must be stated; in the former, it need not be stated, because the condition is always supposed to be good, or the known condition of the particular growth of that species of corn, if it be not otherwise stated.

"And though quality is affected by condition, and therefore weight and measure will, so far, be at fault, yet the corn being sound, it tells all that any standard can tell.

"It is therefore complete, so far as any standard for the sale of corn in the present state of knowledge can be made complete. Whatever is requisite to guide the individual in his own transactions should form a part of the quotations for the general use of the public. Nor is it enough for the individual to know what the quality of his own corn is; he also requires to know what is the market value of corn of that quality.

"If the variation of quality be not stated with the variation of price, it cannot be known whether such variation of price has arisen from variation in quality, or from the variation in the state of the supply and demand, in reference to the corn in hand; or whether it has arisen from a change in the anticipations of the probable future state of the supply and demand, in reference to the coming harvest.

"As long as these causes of the fluctuations in price are mingled with the difference in price that arises from the difference in quality, it is impossible to reach the latter in any way but a guess?

. . . . . .

"Your Committee are sensible that any change must be productive of some degree of inconvenience, or even of injury; yet, as the operation of the present diverse and contrary systems is productive (and that as long as they continue) of the same, as well as of other mischiefs, your Committee are of opinion that the permanent character of the present evils should be put in comparison with the temporary character of the others; and that the amount of the latter at any one time should not be compared with the amount of the former at any one time: but the total magnitude of the one with the total magnitude of the other. And your Committee are also of opinion (looking at the whole of the evidence) that the objection to a system of measure combined with actual weight per measure, because it is unnecessary and impracticable, cannot be sustained.

. . . . . .

"The home trade is carried on between the farmer or grower, and the merchant: the foreign trade between merchant and merchant: of this nature is the Irish trade with Great Britain. Some portion of the home trade is also carried on in the same way.

"Whenever corn is brought at a distance, whether abroad or at home, contracts are made in the same way—that is, by a certain amount in measure or weight, at a certain weight per bushel, but this sort of trade is always carried on between merchant and merchant, or traders of the same description, and never between farmer and merchant.

"In the markets, however, corn is often bought by weight or by measure singly,—the purchaser satisfying himself by inspection and handling as to what will be the weight per bushel, and sometimes relying upon the statement of the seller. In many parts of the country there are two markets in the same place—one for the factors or merchants, the other for the farmers.

"Another difference on which are founded certain considerations of the respective merits of the systems of weight and measure is, that corn is conveyed, either by sea, coastwise, or by inland navigation, in bulks or in sacks, but generally the former. Corn is also sold in bulk by sample.

"The farmer sells to the factor, the merchant, the hoyman, the miller, the mealman, or the maltster. Sometimes he sells by sample, sometimes in the bulk. When the corn is sold in bulk, the whole quantity sold is threshed, winnowed, and cleaned, before it is sold;—when it is sold in sample, this is not always done, but a small quantity, sufficient to serve the purpose of a sample, is prepared.

"An objection has been taken to the use of weight and measure, that the farmer would be continually involved in disputes, from not being able to deliver corn of the quality he had bargained to sell. This inability can arise only from the following causes—namely, the unequal quality of his

corn, or from a change in its condition. Another cause has been assigned—namely, the difficulty of making the bulk equal to the sample.

"If the farmer sell his corn in bulk, this last objection cannot apply, because the corn being all cleaned before it is sold, there can be no variance between the sample and the bulk; or, in other words, between one part and another of the same bulk, if the sample be fairly taken. Nor does the objection apply, for this reason, because in the case supposed, the purchaser is cognizant of the quality of the entire bulk; or, having the entire bulk before him at the time of the purchase, he has the means of satisfying himself that the whole quantity answers to the seller's description.

"Where the farmer sells by sample before the corn is threshed, winnowed, and cleaned, it is not unlikely that the bulk may differ from the sample, because the latter has been cleaned with more care than the bulk. If, then, the farmer sell by a clean sample, and deliver an unclean bulk, which being seen at the time of sale, would not have fetched so high a price as the inspection of the clean sample procured, it is but common justice that the buyer should be able to annul the contract.

"The looseness in the manner of doing business by farmers is the real cause of disputes, and leads to other mischiefs from which they themselves are the chief sufferers. Your Committee are of opinion that the general introduction of a system of weight per measure would be of this farther important service to the agricultural interest (both landlords and farmers), that it would give rise to an active competition to produce better qualities of corn, and prepare it in a better manner. Districts and estates would by this means, from their reputed productiveness, gain an increased value; and farmers would obtain a higher character on account of their greater skill and enterprise.

"Reverting to the other causes assigned for the inability of the farmer to render his bulk equal to his sample, namely, the unequal quality of his corn, and the change in its condition:—the quality of the corn must be presumed to be known to the seller, for he has full opportunities of making himself acquainted with it, which the buyer has not. If, therefore, the buyer be induced to purchase on the representation that the bulk of the corn is of uniform quality with the sample, and the fact turn out to be that the corn is not throughout of equal quality with the sample, then there is the same reason for rejecting the purchase as if the condition had been misrepresented, or as if the bulk were not prepared as well as the sample had been.

. . . . . .

"If a farmer's barns be badly situated, ill constructed for their purpose, or out of repair, the corn deposited there will be more liable to be affected by changes in the atmosphere than corn deposited in buildings not so circumstanced. It is plain that the consequences of any change arising in the condition of the corn from such causes, between the time of sale and the time of delivery, ought to be borne by the farmer; and this view is conformable to the principle which requires that a man should deliver the whole quantity of corn which he has bargained to deliver, although a part of it may have been abstracted by theft between the time of making the contract and the time at which the corn was bargained to be delivered.

"Still a change in condition will sometimes unavoidably happen, notwithstanding the greatest care. This change will, however, be in such case so trifling, as not to affect the bargain with fair dealers. To provide against objection on the part of unfair dealers, a latitude of half a pound over or under the stipulated weight per bushel will be amply sufficient to meet any difficulty of this kind. In general, if the corn be properly housed and well taken care of, the change in condition will be on the side of improvement.

"The combination of weight and measure would soon teach the farmer the extreme range of difference produced by change of atmosphre generally, as well as the difference which might arise in his own case, from the situation, character, and state of his buildings. Having this knowledge, it would be in his power to protect himself, by suitable stipulations, from the risk of dispute on account of change in condition. In point of fact, disputes do now occur in consequence of the bulk being different from the sample; and it is probable that if, by means of the combined system, the attention of the farmer were awakened to the causes of such difference, it would have the effect of preventing instead of creating disputes.

"Disputes among merchants will arise upon the same points: viz., whether the condition of the bulk correspond with the condition of the sample; or whether the weight per measure, or quality of the bulk, correspond with the stipulated weight per measure; or whether the quantity delivered equal the quantity bargained for.

"It is the practice of merchants to mix different parcels of corn, so as to produce a bulk of an uniform quality; and corn so mixed will be desirable for some purposes, and unfit for others. It is, therefore, in most cases, a matter of some importance that the bulk delivered should correspond with the sample upon which the purchase was made; but with the view to obtain a higher price for an inferior article, the sample is sometimes selected from the better part of the corn, and only so much of the better part delivered as will be sufficient to cover the deception. The application of the test of weighing and measuring will detect this fraud. Unlike the case of the farmer, the dealer is aware of the cheat, because he has the corn in a state for the market before he sells. Even, however, in speculations where a party may have bargained to deliver a certain quantity of corn of a given quality, at a given time (not having such corn in his possession when the bargain was made), the case is not altered as regards the buyer, for the seller is equally bound in both cases to fulfil his contract; nothing, therefore, can be urged in these instances against the adoption of the simple test of weight and measure. It may, as in the case of the farmer, be necessary to allow a certain latitude, in order to meet changes in the quality, arising from those alterations in the condition which are produced by variations of the atmosphere.

. . . . . .

"In the course of the examination of several of the practical men who have given evidence before your Committee, a considerable difference of opinion has been expressed in regard to the relative merits of the different systems of weight and measure. Some have strongly urged the adoption of weight alone, while others have urged that of measure alone: again, others have contended for the use of one or other of those standards as the chief ingredient of a combined system; and all parties in the controversy have contended for the use of their favourite system, on the ground of its superiority over the rival one. . . . . .

"It must be borne in mind that both systems, weight and measure, being mere instruments, working by mechanical means, through the agency of man, they must be subject to all the imperfections that can arise through defect in the material or in the mechanism, or in the skill or honesty of the agent. It will be found, therefore, that the differences between weight and measure must turn upon one or more of the following considerations:—

"1. Which is most liable to fraud, in respect of defect in the machinery?

"2. Which is most liable to fraud, in respect of difference of skill and care?

"3. Which is truest in itself, being used by an honest person, and in the best way?

"4. Which occupies the most time?

"5. Which is the least laborious or irksome?

"6. Which is the most costly?

. . . . . .

"Of measure it is said, that it is liable to fraud by light and heavy measuring, and by false striking.

"Of weight, that there is the turn of the scale to counterbalance the objection to measure. . . . If there be, as was before stated, the variation produced between the light measuring of one man and the heavy measuring of another, (and this must be admitted, from the known difference that there is between the slowness or quickness, the lightness or heaviness, in the movements of different men,) there is in weight a corresponding difference in the turn of the scale, arising from the greater or less quickness of eye or attention in different men. . . . Whether corn be measured or weighed, it is commonly put into a sack, in order to be removed into the lighter, or on to the quay, or to be shot into the lighter; but when corn is weighed, instead of the sack being hoisted up, to be at once lodged in the lighter or on the quay, it is stopped in its way, in order to undergo the processes of weighing: these processes being additional to those employed in measuring, must to that extent occasion loss of time. . . . From what has been stated on the last point, it is clear that weight is more laborious than measure. . . . Which is the most costly? In this

point must be taken into account the original greater cost of the machinery, the cost of the wear and tear, the cost of the additional time, and the additional labour: in every one of which particulars weight is more costly than measure. . . . Besides the comparative advantage of measure over weight described in the foregoing parallel, the consideration that measure is more generally used in this country than weight, and that it is also universally used throughout the continent as the standard of quantity, presents the strongest reason for prescribing it as the standard of this country—either alone, or with the addition of weight also. Except in the internal trade of Ireland, even where measure is not commonly used as a standard, it is employed for occasional purposes. It is therefore more or less known everywhere, which weight is not. . . . The grand difficulty would be the substitution of measure for weight, in those places where weight absolutely, or measure with a fixed amount of weight per measure, has been used. . .

"If weight singly be used, then must a scale of weights, corresponding with the quantities contained in the measure now in use, be formed for the following purposes:—1. For the taking the averages;—2. For the collection of the duties;—3. For the corn-rents, or other transactions founded on the price of corn. This scale cannot be fixed on any accurate calculation, it being impossible to find the average weight of the corn grown in this country in any one season, or of the foreign-grown corn that enters into the transactions of the English market. If such average be obtained for one year, it will be untrue for other years. . . .

"Measure being used, and a standard scale of weights per that measure, a complication is induced; because, for the purpose of quotation, private or public, it is necessary to describe the extent of variation, (either in diminution or excess) from that standard.

"If measure and the weight of that measure be described according to the fact in the case, then the same result is produced with one means less, and the natural rule obtains, instead of an arbitrary one. When the same result is produced by different processes, it is good to use such different processes, because their results corresponding, there is assurance of correctness both ways. But it is not good to use a complicated method, having different and independent processes, which not only bear no relation to each other, but are alike different in their operations and in their results, because it does not conduce to greater accuracy, to effect which is the object desired. Hence the combination of measure, with the description of weight per measure, is good as a standard of quantity, because it reaches the same result, viz., the total quantity by different processes. But the measure being given, and an arbitrary scale of weight being given, the measure and weight not being correlative, the results as well as the processes of arriving at them are different. This kind of combination, therefore, does not form a better test of quantity than either weight or measure alone; nor does it give quality; for there is still another particular to be obtained, namely, the relation of the arbitrary quality to the real standard quality of that species of corn.

"The proposition, that the standard should be a combination of measure with the description of the weight per measure of the corn in each case, is free from all the difficulties that attend the others. It is alleged that three results are given; all that is sought, all that can be obtained, by any standard for the sale of corn; but that if weight alone, or measure alone, be used, only one is given.

"The combination gives the quantity, the specific and the actual weight. Measure gives but quantity in measure. Weight gives but quantity in weight. Weight and measure give the quantity in measure, the total quantity in weight, and the weight per measure on the quality. If for any reason a man desires to have his corn weighed, he can weigh it; so he can sell it by weight. If he desire to measure, or sell by measure, he can do so; and he has moreover the specific value of the corn. Illustrations of this are given in the returns from the Commissariat Department and Victualling Office.* The combination may be used, too, for the purpose of identification, and when nicety is required, for the purpose of checking the accuracy of that ingredient, of which it may happen to be employed as the standard of quantity. Nor is it necessary that the whole should be weighed as well as measured for the above purposes. If the corn be fairly shipped, or the bulk be of uniform quality, a single bushel, or even a single peck is sufficient; and in those cases where it is not fairly shipped, or the bulk be not of uniform quality, or these facts be not known, one bushel in ten, or even twenty, will be quite sufficient . . . . It has been objected to the use of weight and measure combined, that it would be to create a double standard; that it would be impossible to establish such double standard, and if possible, that it would be attended with no advantages, but on the contrary, that the increase in the number of particulars would give rise to greater risks of fraud and dispute. The standard is not twofold, but one, combined of the separate ingredients of weight and measure; it is avowedly employed by the most experienced and intelligent men of business, as an indispensable test of quality, and in fact, more or less by all persons, and the advantages resulting from it are comprised in its complete efficiency; nor does it give rise to fraud or dispute, but the contrary, since an ingredient error as to quantity in the one, may be detected by its failure in comparison with the other; and an error as to quality is subjected to a tangible test, a test that is intelligible and facile to all, and is therefore better than the mere judgment of the most experienced person.

"The following is an outline of what might be the leading provisions of a bill for establishing an uniform standard for the sale of corn by measure combined with weight:

"1. That all corn should be sold by the imperial bushel.

"2. That the weight per measure of corn sold should be returned to the inspectors with the quantity now returned, and by the parties, who are now required to make returns, whenever the weight per measure forms a part of the bargain.

"3. That a memorandum of the quantity sold, with the weight per measure should be given by the seller to the buyer.

"4. That the inspectors be required to give to any newspaper of the district willing to publish it free of expense, a copy of the total quantities of each kind of corn of each degree of weight per measure.

"5. That all shipments from Irish ports should be made in measure with the weight per measure, or in weight as now, with the weight per measure.

"6. That in the port of London, and elsewhere, the meters, being public corporation officers, shall not only measure the whole quantity of corn, or such portion of it as the buyer may require, but shall also weigh one part in —— of the quantity so measured, if the buyer shall require it, without any additional fee.

"7. That the buyer may require the whole quantity to be weighed as well as measured, at his own expense, except in those cases where disputes may arise as to the accuracy of measuring, and the return made by the meter may differ from the invoice or bill of lading; and that, in the latter case the expense shall be borne by the party who may appear by the result to have been in the wrong.

"8. That the act shall extend only to England, Wales, and Scotland, except as to the foregoing provision as to Irish shipments.

"9. That in all cases where the terms of a bargain do not include such latitude, or prescribe a different latitude, it shall be held to be a sufficient compliance with the bargain, if corn be delivered weighing one half-pound, or within one half-pound, per bushel, more or less than the sample, or than the weight per measure bargained for."

* In the Appendix to the Report.

ON THE POLITICAL HISTORY AND STATISTICS OF THE ITALIAN STATES.

THE political settlement of the modern Italian States may be considered as having begun with the treaties of Utrecht and Rastadt, after the war of the Spanish succession, and having been completed by the treaty of Aix-la-Chapelle in 1748. For the period of two centuries previous to the war of the succession, that is to say, since the conquest of Naples by Ferdinand the Catholic, in 1501, and the subsequent occupation of the Duchy of Milan by Charles V., the greater part of Italy had been deprived of all national independence; Naples, Sicily, the island of Sardinia, Lombardy, and the coast of Tuscany, were annexed to the crown of Spain, and administered by Spanish governors, whilst the republic of Genoa was under the protection and direct

influence of the same power. The only Italian governments that maintained a sort of independence were Venice, the house of Savoy, Tuscany, and the Pope. Those two hundred years were for Italy a time of the greatest depression, material and moral.

The war of the Spanish succession, and the peace of Utrecht which followed in 1713, put an end to the rule of the Spanish viceroys. One of the Italian States at the same time was raised to the rank of a kingdom. The Duke of Savoy assumed the title first of King of Sicily, and soon after by exchange, that of King of Sardinia, which his successors have retained ever since. Besides the acquisition of that important island, the House of Savoy acquired a considerable increase of territory on the side of Lombardy. By the same peace the duchies of Milan and Mantua were guaranteed to the German branch of the house of Austria, the Spanish line of the same family having become extinct. Naples passed likewise under the dominion of Austria.

In 1734, during the war between the houses of Austria and of Bourbon, on account of the Polish succession, the Infante Don Carlos, son of Philip V. of Spain, conquered the kingdoms of Naples and Sicily, driving the Austrians away from them, after which he was proclaimed king, his father giving up to him and his successors all his rights to those fine countries. The treaty of Vienna of 1735 acknowledged Charles as King of Naples and of Sicily. Thus another Italian kingdom was revived, and restored to an independent rank among the states of Europe. When Charles was afterwards called to the throne of Spain in 1759, he resigned Naples and Sicily to his younger son Ferdinand and his successors, declaring the crown to be for ever detached from that of Spain. By the same treaty of Vienna, the succession to the grand duchy of Tuscany on the extinction of the House of Medici, was secured to Maria Theresa of Austria and her husband Francis of Lorraine. When Maria Theresa, by her father's death, came to the possession of his hereditary states in Germany, Tuscany remained under the sway of her younger son Leopold and his successors, as a separate and independent state.

Lastly, the treaty of Aix-la-Chapelle in 1748, which terminated the war of the Austrian succession, besides confirming all the above arrangements, secured the duchy of Parma and Piacenza, which had become vacant by the extinction of the male line of the house of Farnese, to the next heir Don Philip, Infante of Spain, and his successors. It also gave to the King of Sardinia a further increase of territory on the side of Lombardy and of Piacenza. The duchy of Modena was guaranteed to the House of Este. Venice, Genoa, and the Papal state remained untouched.

There were, therefore, in Italy in the eighteenth century, two kingdoms, viz.: Naples and Sardinia; three republics: Venice, Genoa, and Lucca; the Papal state; and three independent duchies, namely, Tuscany, Parma, and Modena. The duchies of Milan and Mantua belonging to Austria, were the only part of Italy annexed to a foreign crown.

The half century which elapsed from the peace of Aix-la-Chapelle till the French revolutionary invasion of 1796, was to Italy a period of perfect peace, attended by considerable internal prosperity. The various states were administered by resident sovereigns, and by native ministers, instead of the former governors and generals sent from a distant court. And it also fortunately happened that these sovereigns and their ministers were almost all men of abilities and enlightened views. Charles Emmanuel III., King of Sardinia, and his minister, Count Bogino, Charles III. of Naples, and the Marquis Tanucci, Leopold of Tuscany, the Duke Philip of Parma, and his minister Dutillot, and at Rome the two Popes Lambertino and Ganganelli, are all known in history for their public merits as well as for their personal worth. Among the improvements they effected may be mentioned as most important—the total abolition of feudality in some states, and the restriction of its prerogatives in others; the gradual suppression of monasteries; the limitation of the right of asylum for criminals enjoyed by the churches; the compilation of judicial codes of laws; the extirpation of the highway robbers; the better administration of justice and of the police; ameliorations in the system of taxation; universities and colleges opened; men of science and of letters encouraged; new roads made; and the cities embellished. Much was done, and much which remained to be done was in progress of being effected. In order fully to appreciate what was done at that time, it would be necessary to examine the condition of the country, its people and institutions, during the two previous centuries. The states in which the amelioration was most marked were, Naples, Sicily, Sardinia, and Tuscany. In Lombardy likewise, the administration of Count Firmian in the reign of Joseph II., proceeded perhaps further than that of any other Italian government in useful reforms, in the abolition of feudal privileges, in the establishment of equal justice, in the encouragement given to education and learning. One evidence of the favourable result of all this was given by the number of distinguished men in almost every branch of learning, who flourished in Italy in the latter part of the eighteenth century. It was an epoch of general revival in that country.

The French invasion of 1796 totally subverted the political and civil system of Italy. Buonaparte took Milan and Mantua from Austria, drove away the Duke of Modena from his territory, and seized on the Legations or northern papal provinces. Out of these states he formed the Cisalpine, afterwards called Italian, republic. He overthrew the republic of Venice, and gave its territories to Austria, as some compensation for the loss of Flanders, Lombardy, and the districts Austria possessed on the left bank of the Rhine. The King of Sardinia he reduced to the condition of a tributary of France. Shortly after the French Directory drove that king away, and took possession of his continental states. The rest of Italy was likewise invaded in 1798, and all its governments were abolished, and several republics erected in their stead, which were all overthrown again in the following year. By the peace of Luneville in 1801, Tuscany was given to the Prince of Parma, and the latter duchy was taken possession of by France. After Buonaparte became emperor in 1804, he suppressed the republic of Genoa, and annexed that state to his own empire. The Italian republic likewise he transformed into a kingdom, of which he made himself king. A new war having broken out with Austria in 1805, he retook the Venetian states, and annexed them to the kingdom of Italy. Piedmont and Parma, and afterwards Tuscany, were united to the French empire. The little republic of Lucca was changed into a principality, and bestowed on one of Napoleon's sisters. And lastly, in 1809, Rome was likewise invaded, and the papal state dismembered, the northern provinces or marches being joined to the kingdom of Italy, while the southern ones, including Rome and Perugia, were annexed to France. Naples had been already occupied by the French armies, and given to Joachim Murat.

During the latter years of Napoleon's dominion, Italy was therefore divided with regard to its administration into three nearly equal parts, namely,—1, the so called kingdom of Italy, which comprised the north-eastern part of the Peninsula: 2, French Italy, which included Piedmont, Genoa, Parma, Tuscany, and Rome: and 3, the kingdom of Naples. The islands of Sicily and Sardinia remained under their old kings. Politically speaking, all the continent of Italy was merged into the system of Napoleon's universal military monarchy; but with regard to the internal administration, the two kingdoms of Naples and of Italy retained a sort of national existence, and many useful reforms were made in both, especially in the judiciary system. The last remains of feudality were likewise abolished.

By the overthrow of Napoleon, in 1814, the King of Sardinia was restored to his continental dominions with the addition of Genoa. Austria retook possession of the Venetian states as well as of Lombardy; Tuscany was restored to its Grand Duke Ferdinand, Modena to the heir of the house of Este, the Pope resumed his former territories, Parma was given to Maria Louisa, Napoleon's consort; and Lucca to the son of the former Prince of Parma. In 1815, Murat having declared war against Austria, was driven from his kingdom, which came again into the possession of Ferdinand of Sicily.

The difference between this settlement effected by the restoration, and that which existed before the French invasion, lies in these two main points: 1st, Venice, as an independent state, has disappeared, and by its annexation to Lombardy has doubled the extent of the former Austrian possessions in Italy, which are also thereby rendered contiguous to the German possessions of that power, which contiguity did not exist before, the Venetian territory being then interposed between Austrian Lombardy and the German territories of the same power. 2nd, The annexation of Genoa to the Sardinian kingdom has rendered that last state more compact, and has given it an important addition

of territory, a wealthy city, a long line of coasts, some good harbours, and a numerous seafaring and mercantile population. The other Italian states have been replaced within the same limits as they were before the French invasion. Tuscany has gained Piombino and several other points on the coast, and the whole island of Elba, of which it had only a part before.

The present Italian states are eight in number: four larger ones,—namely, the kingdom of Sardinia; the kingdom of Naples and Sicily, which bears now the title of the United Kingdom of the Two Sicilies; the Lombardo-Venetian kingdom subject to Austria; and the Papal state; and four small ones,—namely, the grand duchy of Tuscany; the duchy of Parma and Piacenza; the duchy of Modena and Massa; and the duchy of Lucca. The diminutive republic of San Marino, with its 2000 souls, which has survived all political changes and revolutions, lies in the midst of the Pope's territories, and is under the protection of that power.

The extent and population of the Italian states, according to the latest statistical accounts, are as follows:—

	Square Italian miles, 60 to a degree.	Inhabitants
Sardinian monarchy	21,424	4,260,000
Kingdom of the two Sicilies	31,779	7,130,000
Lombardo-Venetian kingdom	13,640	4,279,000
Papal state	13,000	2,592,000
Grand duchy of Tuscany	6,320	1,300,000
Duchy of Parma	1,712	454,000
Duchy of Modena and Massa	1,468	350,000
Duchy of Lucca	320	152,800
Total square Italian miles	89,663	Population 20,817,800

The annual increase of population in all Italy is stated by Moreau de Jonnès to be at the rate of 205,000, or about one hundredth part of the population. The progress of increase is greatest in the continental part of the kingdom of the two Sicilies, in Lombardy, and in the small duchy of Lucca, which last is one of the most densely peopled territories in Europe, having 477 inhabitants to 1 Italian mile. Another peculiarity of the state of Lucca is its having 39,000 proprietors of land, or 1 proprietor to every 4 individuals. There is hardly a labouring man who is not a proprietor. This is considered to be in great measure the result of the abolition of *fidei commissi*, majorats, and ecclesiastical corporations and monasteries, and of the repartition of communal property, and the consequent minute subdivision of land which has taken place, and the operation of which is more visible in a circumscribed agricultural district than in more extended and wealthier countries. It ought also to be observed that a great number of young men from the country of Lucca emigrate annually in quest of employment, many go about the world selling images, and others proceed to the Tuscan Maremme, and to the island of Corsica, to work as labourers. Many of these emigrants, on their return home, bring back with them the produce of their savings.

The population of the cities and large towns has rapidly increased since the peace. Great part of this increase, however, must be attributed to fresh arrivals from the country districts. Turin, which in 1815 had 73,000 inhabitants, reckons now 117,000. Florence, from 70,000, has risen to 91,000. Rome, which in 1796, before the French invasion, reckoned 165,000, fell in 1810 to 123,000; it had risen again in 1820 to 135,000, and in 1831 to 150,000. Milan, which is by many supposed to have declined since the restoration, reckoned in 1810, 132,000, and it now reckons 130,000. Venice is perhaps the only city that has really and permanently declined; it reckoned in 1797, 150,000 inhabitants, it now reckons about 100,000. Naples reckons 358,000; and Palermo, the capital of Sicily, 171,000: Genoa, 80,000; Leghorn, 70,000: Bologna, 62,000: Messina, 60,000: Verona, 50,000; Catania, 45,000; Padua, 47,000; Parma, 36,000; Brescia, 34,000. Many towns have from 20,000 to 30,000 inhabitants, such as Bergamo, Vicenza, Mantua, Cremona, Alessandria, Asti, Ancona, Perugia, Ferrara, Ravenna, Piacenza, Modena, Lucca, Siena, Pisa, Cagliari in the island of Sardinia, &c. A still greater number reckon from 10,000 to 20,000. Italy is of all continental countries that which has the greatest number of populous towns in proportion to its extent.

In all the Italian states the great bulk of the population is employed in agriculture. The proportion of agriculturists however is less than in France, being about two-thirds of the whole, while in France it is nearly three-fourths. The Italian States in which the agricultural population is greatest in proportion to the rest, are the kingdom of Naples and the Papal territory. The same class is least numerous in the territory of Genoa, more than one-half of the people there deriving their subsistence from trade and navigation. The greater part of the Riviera of Genoa is rocky and not fit for tillage. In the Papal State there are about 1,500,000 of people living by the land, and 700,000 employed in mechanical professions and trade.

The chief manufactures of Italy are silks in Lombardy, Genoa, Piedmont, Tuscany, Lucca, and Naples; coarse woollens in Genoa, Piedmont, Rome, and Naples; glass works at Venice; straw hats in Tuscany and Lucca. Paper is made in all the states, both for home consumption and exportation. In Lombardy manufactures of common cotton stuffs have been introduced of late years.

The principal productions for exportation consist of corn, rice, hemp, and silk in Lombardy and Piedmont; oil, silk, and potash in Tuscany; corn, rice, timber, charcoal, hemp, and salt in the Papal State; oil, silk, wool, corn, wine, fruit, and salt in Naples and Sicily. The greatest industry and skill in agriculture are employed in Lombardy, Piedmont, Tuscany, and the northern Papal provinces; the least in the islands of Sicily and Sardinia.

The most fertile soils are those of Lombardy and of Campania in the kingdom of Naples. The system of irrigation prevails in North Italy.

With regard to the system of agriculture followed in the Maremme of Rome and Tuscany, it may be observed that it is of a peculiar nature, and perhaps the only one suited to the climate, and the thin population of those districts.

The principal iron-mines are, in the island of Elba, at Caneto in the state of Parma, in the Val d'Aosta, at Stilo in Calabria, and in the provinces of Bergamo and Brescia. There are copper-mines in the province of Belluno in the Venetian territory, and lead-mines in Savoy. The marble quarries at Carrara employ 1200 workmen, and afford a yearly revenue of about 30,000*l.* sterling. Coal is found in some valleys of Piedmont, in the province of Teramo, in Abruzzo, at Leffe near Bergamo, and near Rimini in the Papal State, but very little use has been made of it as yet.

The maritime commerce has rapidly increased since the peace. Italy now exports annually to the amount of about 10,000,000*l.* sterling, of which silk makes about 5,000,000*l.*, oil 2,000,000*l.*, and rice and hemp 1,000,000*l.* The silk is exported from the various states in the following proportions:—

	Livres (25 to £1 ster.)
Lombardo-Venetian kingdom	85,000,000
Sardinian kingdom	20,000,000
Parma	1,000,000
Tuscany	2,500,000
Lucca	200,000
Island of Sicily	4,000,000
Naples, Papal State and Modena	12,000,000
	124,700,000

This quantity of silk is purchased chiefly by France, England, and Germany. The operations connected with the production of the silk, the spinning of it, and the several manufactures of silk goods, give employment, in Lombardy and Venice alone, to 100,000 individuals.

Italy imports about 12,000,000*l.* sterling of foreign goods annually. Of these, 4,500,000*l.* consist of English goods, chiefly manufactures, besides colonial articles, salt fish, &c. Italy, therefore, consumes more English manufactures than any other country of Europe, Germany excepted. All the Italian states, except the Lombardo-Venetian kingdom, are open to English manufactures. In Lombardy and Venice the duties on foreign manufactured goods are, in most instances, tantamount to prohibition, and this is for the purpose, as it is said, of encouraging home manufactures: however, a vast system of smuggling is carried on on the frontiers. By an ordinance of May, 1833, all sorts of cotton twist are now admitted into Lombardy, and the duty has been reduced one-half. About 50,000 individuals are now employed in Lombardy in the manufacture of common cotton stuffs and prints. Italy imports French goods to the amount of about 40,000,000 of livres annually, chiefly fine

woollen cloths, silks, and other articles of fashion and luxury. It also imports corn from the Black Sea, iron and copper from the north of Europe, tobacco from Portugal and America, &c. There is a curious fact observed in the custom-house entries of the little duchy of Lucca. The importation of foreign goods in the year 1831 amounted to 5,000,000 of livres, an amount too large to be accounted for either by the numerical population of the country or its resources and habits. The only plausible explanation is, that a considerable quantity of the goods thus imported into Lucca were smuggled over the mountains into the neighbouring states. The roads of Viareggio constitute the only seaport of Lucca, and some hundred small coasting vessels belong to that place. The duchy of Modena also touches the sea by means of its province of Massa and Carrara, and has some coasting vessels under its national flag. The duchy of Parma is the only Italian state having no sea-coast, but it has, as well as the neighbouring state of Modena, an outlet to the Adriatic by means of the river Po, and accordingly we find mentioned, occasionally, arrivals of Parmesan vessels in the harbours of the other Italian states. A steam-boat plies on the Po between Lagoscuro near Ferrara, and Venice. Steam-boats have ascended the Po as high as Pavia.

The maritime trade of Italy is carried on chiefly at the ports of Genoa, Leghorn, Naples, Messina, Ancona, and Venice. In the year 1832 the arrivals at Genoa were as follows:—452 vessels from the Black Sea, 102 from the Levant, Egypt, and Barbary, 898 from the ports of Europe on the Atlantic and Northern Sea, 58 from America, and 1347 from the ports of the Mediterranean and the Adriatic; this last number consisting chiefly of vessels of small burthen. Of the whole number, 2283 were under the Sardinian flag. There are about 5000 vessels belonging to the different harbours of the Sardinian states, and chiefly to Genoa and the other seafaring towns on the Riviera, and 40,000 seamen. The Genoese trade directly with South America in their own vessels. Leghorn is, next to Genoa, the most frequented harbour in Italy, but its trade is carried on almost entirely under foreign flags, the Tuscans having but few ships of burthen. The arrivals at Leghorn in 1832 were, 239 vessels from the Black Sea, 231 from the Levant, Egypt, and Barbary, 159 from the ports of Europe on the Atlantic and Northern Seas, 49 from America, and 2356 from the coasts of the Mediterranean and the Adriatic: two-thirds of the whole number were coasting vessels or small craft. Of the larger vessels the most numerous were the English, next come the Austrian, the Russian vessels next, and the Greek, Sardinian, Swedish, and American vessels after in succession. In the port of Naples, during the same year, the arrivals were, 19 vessels from Egypt and Barbary, 128 from the ports of Europe on the Atlantic or Northern Seas, 4 from America, and 3226 (chiefly small craft) from the coasts of the Mediterranean and the Adriatic. Of the larger vessels that arrived nearly two-thirds were English. The Neapolitans have about 2400 vessels, of which, however, the greater part are coasting traders. The most enterprising seamen are those of the coast of Sorrento, opposite Naples; they own about 200 vessels, many of them of considerable burthen, in which they navigate the Atlantic and the Northern Seas. They also proceed to America, where a Neapolitan flag was, we believe, a thing unknown twenty years since. In the port of Venice we find the arrivals in 1832 were, 15 vessels from the Black Sea, 21 from the Levant, 52 from Europe outside the Straits of Gibraltar, 4 from America, and 1204 from the Mediterranean and Adriatic. Of the whole number 1025 were small craft. Of the larger vessels 36 were English, and the rest chiefly Austrian and Sardinian. In the same year we find 33 English vessels to have arrived in the ports of Ancona and Civita Vecchia, in the Papal State.

The only Italian States which have a naval force are Sardinia and Naples. The Sardinian navy consists of 4 ships of the line, 5 frigates, and 8 smaller vessels. Naples has 2 ships of the line, 5 frigates, and 18 smaller vessels. The Venetian ships of war form part of the Austrian navy.

The public revenue of the Italian States is as follows:

Sardinian Kingdom	65,800,000 livres.
Kingdom of the Two Sicilies	84,000,000
Lombardo-Venetian Kingdom	83,000,000
Papal State	43,000,000
Tuscany	16,000,000
Parma	6,500,000
Lucca	1,900,000

Of the administration—civil, judicial, and economical—of the various Italian States, we shall give an account in another article.

PARLIAMENTARY ABSTRACTS.

Taxes Remitted or Repealed since 1814.—The following is an abstract of a return to the House of Commons of all the taxes remitted or repealed since 1814, with a list also of those partially remitted or repealed, and the date of remission, &c.:—

GREAT BRITAIN.

CUSTOMS.—Taxes wholly repealed.

Date.	Nature of the Taxes Repealed.	Amount of Tax the year immediately preceding the Repeal.
1814	War duties and exports on coals, slates, and stones, coastways, and on shipping inwards and outwards	£.919,761
1815	War duties on cotton wool imported in British ships	214,650
1816	Duty on lead exported	40,967
1821	Duty on cotton wool of the British plantations in America	19,448
1822	Duty on shipping inwards and outwards	152,963
1823	Duty on stone brought coastways	24,543
1825	Quarantine duty on shipping	20,842
1831	Duty on coals and slates brought coastways	926,066

Taxes partially repealed:—

Date.	Nature of the Taxes partially Repealed.	Estimated Amount of Duty Repealed.
1823	Barilla	£.48,272
	Coals exported	19,000
1824	Raw, waste, and thrown silk	555,549
	Coals brought into London	241,412
	Rum	157,000
	Sheep's wool	381,450
1825	Wine	950,809
	Coffee and cocoa	211,702
	Cambrics	9,060
	Cotton manufactures, including yarn	26,837
	Iron unwrought	58,038
	Sheep's wool	8,000
	Tobacco	658,967
	Hemp	128,353
	Pearl and potashes	24,127
	Flax	13,405
	Indigo	19,085
	Madder and madder root	29,808
	Lamb skins undressed	13,052
	Kid skins dressed	9,480
	Olive oil	35,936
	Cochineal	8,389
	Rags for paper	9,804
	Small nuts	12,613
	Elephants' teeth	7,824
	Valonia	6,339
	Train oil	6,545
	Books	5,369
	Ostrich feathers	5,909
	Pimento	5,840
	Glass bottles	5,158
	Tar	5,884
	Quicksilver	8,818
	Thrown silk	56,558
1826	Rum	469,000
	Pepper	100,486
	Smalts	5,550
	Flax-seed and linseed	24,490
	Raw and waste silk	25,338
	Mahogany	30,854
	Oranges and lemons	19,077
	Rape seed	54,335
1828	Rice	7,410
1829	Barilla	14,162
	Raisins	6,488
	Thrown and waste silk	57,287
	Silk manufactures	24,827
1830	Barilla	11,431
	Sugar	488,303
	Molasses	19,240
1831	Coals exported	10,175
	French wine	23,283
1832	Almonds	10,867
	Cocoa-nuts and shells	8,555
	Gums	11,490
	Hemp, £.109,230, but deducting bounty on cordage exported, discontinued, is	£.103,743

Date.	Nature of the Taxes partially Repealed.	Estimated Amount of Duty Repealed.
1832	Mahogany	7,318
1833	Cotton wool	311,203
	Madder and madder root	14,386
	Shumac	5,637

Note.—The foregoing statement exhibits every instance of a reduction or repeal of duties by which the collective revenue of Great Britain and Ireland was affected to the extent of 5000*l.* or upwards. The insertion of the minor articles would have extended the return very materially, without sensibly altering the result.

Excise.—Taxes remitted or repealed :—

Date.	Nature of the Tax Repealed.	Estimated Amount of Duty Repealed.
1816	Malt war duties, 2*s.* per bushel	£.2,739,571
1822	Malt, annual duty, 1*s.* per bushel [These duties were granted under separate acts of Parliament, and the produce directed to be kept distinct for specific purposes. But in order to show the effect of the reduction upon the produce of the malt duty generally, the amounts have been ADDED to the account of taxes *partially* remitted or repealed.]	1,415,443
1825	Salt [Salt was reduced 13*s.* per bushel from January, 1823.]	233,722
1830	Hides and skins (duty and licenses) [The duties on hides and skins were previously reduced one half from July, 1822.]	381,878
	Beer	3,110,570
1831	Printed goods (duty and licenses)	2,109,282
1832	Candles (duty and licenses)	482,686
1833	Tiles	38,010
	Taxes partially remitted or repealed :—	
1816	Malt, reduced 2*s.* per bushel (war duties)	3,365,342
1818	Plate glass, reduced 1*l.* 8*s.* per cwt.	16,634
1822	Malt, reduced 1*s.* per bushel (annual duty)	1,142,632
	Irish spirits imported into England, reduced 7*d.* per gallon [In the year preceding the partial repeal the duty collected was 179,699*l.*, in the year subsequent it was 256,881*l.*]	
1822	Hides and skins reduced to one half the former rates	239,084
1823	Spirits for consumption in Scotland, reduced 3*s.* 9*d.* per gallon. [The duty collected in the year preceding the partial repeal was 530,356*l.*, in the year subsequent it was 5 4,758*l.*]	
1825	Flint glass, reduced 2*l.* 2*s.* per cwt.	223,631
	Licenses reduced (various rates)	108,896
1826	Spirits for consumption in England, reduced 4*s.* 8½*d.* per gallon [The duty collected in the year subsequent to the reduction was 2,055,027*l.*, and in the year subsequent 2,592,521*l.*]	
1830	Soap reduced to one half of the former rates	757,122

Stamps.—Total stamp duties repealed in

1824	£.180,000	1827		£.2,306
1825	1,000	1832		1,134
1826	67,300	1833		30,600

Stamp duties partially repealed in

1825	£.60,000	1828	£.12,500	1833 £.88,800

Post Office.—Taxes repealed :—

1819	Certain rates of postage on letters between Great Britain and the East Indies	25,000
1824	Packets containing re-issuable country bank notes, authorised to be conveyed at one fourth part of the rate on letters [No estimate can possibly be furnished.]	
1827	The separate and distinct rates of postage in Great Britain and Ireland, respectively, on letters between Great Britain and Ireland	40,000
	The separate rates on merchants' accounts, bills of exchange, &c. &c.	40,000
1831	Twopenny rates on letters passing from the Inland and Foreign Offices, by extension of the general post delivery to the distance of three miles round the Post Office. The concession to the public estimated at	25,000

Tax Department.—Taxes remitted or repealed :—

1815	Property-duty, amount repealed	£.14,617,823
1817-1825	Duty repealed on houses and windows	303,453
	The amount of the duties reduced in respect of houses in trade and other houses, by the act of last session, cannot be ascertained, but it has been estimated at	250,000
1816-1833	Duty repealed on servants	210,920
1823-1833	Ditto on carriages [The amount of the duties repealed by act of last session on certain kinds of two-wheeled carriages cannot yet be ascertained.]	75,545
1816-1831	Duty repealed on horses	549,894
1824	Ditto on dogs	6,876
	The total of duties repealed in the Tax department of Great Britain since 1814 is	16,014,511
	The total amount of duties partially repealed in the same department during the same period is	2,473,852
	Total assessed taxes repealed or partially remitted	£.18,488,363

IRELAND.

Customs.—Taxes wholly repealed :—

Date.	Nature of the Taxes Repealed.	Estimated Amount of Duty Repealed.
1814	War duties on exports	£.12,164
1815	War duty on cotton wool imported in British ships	8,099
1821	Duty on cotton wool of the British plantations in America	184
1823-1825	Union duties on British manufactured goods imported into Ireland	153,769
1825	Duty on salt imported	12,411
1831	Duty on coals brought coastways	67,807
	Taxes partially repealed :—	
1819	Cotton wool	7,113
1823	Barilla	16,455
1824	Raw, waste, and thrown silk	3,786
	Rum	1,613
	Sheeps' wool	37
1825	Wine	60,904
	Coffee and cocoa	4,343
	Iron, unwrought	2,020
	Sheep's wool	125
	Tobacco	187,484
	Hemp	3,056
	Pearl and potashes	939
	Flax, indigo, madder, skins, olive oil, books, feathers, bottles, tar, &c., &c.	2,854
	Quicksilver	138
	Thrown silk	1,316
1826	Rum	1,203
	Pepper	5,043
	Smalts	142
	Flax-seed and linseed	6,597
	Mahogany	605
	Oranges and lemons	909
1828	Rice	114
1829	Barilla	7,024
	Raisins	4
	Thrown and waste silk	220
1830	Barilla	6,311
	Sugar	49,331
	Molasses	67
1831	Coals exported	88
	French wine	3,693
1832	Almonds	472
	Cocoa-nuts and shells	1,426
	Gums	5
	Hemp, £3944, but deduct bounty on cordage exported discontinued	3,501
	Mahogany	530
1833	Cotton wool	466
	Madder and madder root	296
	Shumac	236

Excise.—Taxes repealed :—

1830	Hides and skins (duty and licenses)	51,630

Taxes partially repealed:—

Date.	Nature of Taxes partially Repealed.	Duty in the year preceding.	Duty in the year subsequent.
1816	Malt, reduced 2*s.* per bushel	£.359,806	£.164,771
	Spirits for consumption in Ireland, reduced 6*d.* per gal.	1,037,185	1,012,747
1822	Malt, reduced 1*s.* per bushel	347,424	275,613
1823	Spirits for consumption in Ireland, reduced 3*s.* 2*d.* per gallon	624,819	803,148
1825	Licenses reduced (various rates)	171,510	168,059

STAMPS.—Taxes repealed:—

Date.	Nature of the Taxes Repealed.	Estimated Amount of Duty Repealed.
1819	Requisition or request note for any permit	£.24,000
1824	Certain duties on law proceedings	98,000
1832	Bill of costs taxed by any taxing officer	1,300
	Writ after judgment	4,800

[There are other Taxes repealed, especially on receipts for sums under 5*l.*, of which an estimated amount cannot be given.]

Duties partially repealed:—

Date.	Nature of Duty partially Repealed.	Amount collected in year preceding.	Amount collected in year subsequent.
1822	Bankers' notes under 5*l.* Irish, reduced from 3*d.* to 1½*d.*	£.4,085	£.1,559
1825	Bond in respect of duties of customs and excise, reduced one half	16,000	8,000
1828	Playing cards, reduced one half	1,006	244
	Protests on bills of exchange, &c.	6,797	4,709
1833	Advertisements reduced from 2*s.* 6*d.* to 1*s.*	15,248	No statement is given in the return.

[There are other duties partially repealed, of which a separate account cannot be given.]

POST OFFICE.

The amount of taxes repealed in the Irish Post Office department since 1814, is £.13,198

TAX DEPARTMENT.—Taxes repealed:—

1816	House tax	17,650
	Hearth tax	14,571
1823	Hearth tax	21,452
	Window tax	109,813
	Carriage duty	52,665
	Servant duty	31,984
	Horse duty	48,842

TRADE, STATISTICS, &c.

Supply and Consumption of Cotton.—A statement has recently been published in New York of the crop of cotton in the United States during the year ending 30th of September last. The total quantity produced is stated to have been 1,205,304 bales, exceeding by about 135,000 bales, the crop of any previous year.

The exports of cotton from the various ports in the United States during the same period, viz. between 1st October, 1833, and 30th September, 1834, has also been published, distinguishing the counties to which the shipments have been made, as under, viz.:—

Ports of Shipments.	To Great Britain.	To France.	To North of Europe.	To other Foreign Ports.	Total.
New Orleans	289,169	101,253	9,742	1,384	401,548
Mobile	96,180	15,256	944	4,760	117,140
Savannah	144,804	17,638	544	1,227	164,213
Charleston	142,194	46,433	21,554	2,237	212,418
Virginia	19,749	9,144	1,764	388	31,045
New York	54,568	25,876	7,655	895	88,994
Other ports	9,627	833	1,068	1,065	12,593
Total to foreign ports	756,291	216,433	43,271	11,956	1,027,951
Same in year ending 30th Sept., 1833	630,145	207,517	23,840	5,953	867,455
Same in year ending 30th Sept., 1832	638,148	207,209	29,685	16,686	891,728

It appears from these statements, that seventeen-twentieths of the cotton produced in the United States is exported to foreign countries, and that very nearly three-fourths of the shipments are made to this country. The quantity sent to the United Kingdom in the annual period that expired on the 30th September last, exceeds that of the preceding twelvemonths by 126,146 bales, which is an increase of twenty per cent. Measured by the shipments of the annual period ending 30th September, 1832, the increase is 118,143 bales, or eighteen and a half per cent. Notwithstanding this augmentation of the supply, it does not appear that any accumulation of stock has been experienced in our markets. On the contrary, the estimated quantity remaining of all kinds of cotton in Liverpool, where the great bulk of the cotton business of this kingdom centres, was on the 14th of November just passed, considerably smaller than at the same period of 1833. The stock which was then (in 1833) 237,070 bales, is now reduced to 133,630 bales. In confirmation of this estimate, it may be stated that the quantity of cotton taken from the warehouses for consumption, during the nine months of 1834, ending with September, exceeded the quantity taken during the corresponding period of 1833, by twenty-five millions of pounds weight, affording thus a most convincing proof of the continuing prosperity of this great staple of British manufacture.

About four-fifths of the cotton imported into the United Kingdom is of the growth of the United States of America; the remaining one-fifth is brought from our possessions in India and the West Indies, from Brazil and from Egypt. The quantities imported altogether in the year 1833, amounted to 303,656,837 lbs., which were supplied in the following proportions, viz.:—

	lbs.
United States of America	237,506,758
Brazil	28,463,821
Turkey and Egypt	987,262
Other foreign countries	1,696,108
East Indies and Mauritius	32,755,164
British West Indies	2,084,862
Other British possessions	162,862
Total	303,656,837

The total quantity re-exported in the raw state was no more than 17,363,882 lbs, while the quantity taken for consumption in the year 1833 was 293,682,976lbs., being the largest quantity ever used in this kingdom, but which is sure to be considerably exceeded in the present year, the clearances from the warehouses being already beyond that quantity at the time when seven weeks of the year were yet unexpired.

North American Indians.—The following statements are extracted from the documents printed by order of the House of Commons relative to the aboriginal tribes in British possessions.

Expenses of the Indian Department, in the Provinces of Lower and Upper Canada.

Amount of the establishment for 1829:—			
Lower Canada	£2,486	18	4
Upper Canada	2,886	7	6
	5,373	5	10
The value, in 1828, of the various articles presented to the different Indian tribes of the Canadas, in lieu of lands ceded, or for services performed at former times, was, in sterling money	24,310	4	4
Total	£29,683	10	3

The Lords Commissioners of the Treasury directed, in 1831, that in future the expense of this department should not exceed 20,000*l.* The charge for presents, in former years, used to be voted in conjunction with that for liberated Africans, convicts, &c.; and the salaries and pensions of the officers were paid from the military chest provided for out of the army extraordinaries. The amount of the presents have been reduced, since 1816, from 117,500*l.* to about 16,000*l.*, and the charge of the establishment and pensions from 16,200*l.* to 4400*l.*

It appears that the Indian department was formerly under the direction of the civil governors of Lower and Upper Canada; but from the inconvenience which resulted from that arrangement, it was placed under the commander of the forces, at the commencement of the late American war. The pay and allowances of the Indian department are issued by authority of the officer holding the military command, and the presents are delivered by the commariat.

Number of Indians of Upper and Lower Canada.—The following list was given by Major-General Darling to the Earl of Dalhousie:—

Lower Canada.

Tribe.	Residence.	No. of Indians.
Hurons	Lorette near Quebec	179
Algonquins	Three Rivers and Lake of the Two Mountains	437
	Carry forward	616

Tribe.	Residence.	No. of Indians.
	Brought forward	616
Nipissingues	Lake of the Two Mountains	250
Amalicites	Ristigouche	65
Iroquois	Three different Tribes at Caughnawaga, St. Regis, and the Lake of the Two Mountains	1597
Abenaquois	Becancour and St. Francis	459
Wandering Tribes, chiefly Micmacs	From New Brunswick and Nova Scotia	450
	Total	3437

The probable expense of settling these Indians in Lower Canada, in seven settlements, for the first five years, was estimated at 22,784*l.* 17*s.* 8*d.* The number of Indian missionaries on the establishment of the Indian department of Lower Canada is 5. Their names and salaries are—

	Stations.	Salaries.
Rev. T. Cook	Lorette	£46 8 6
— J. Marcoux	Caughnawaga	46 8 6
— L. Amiot	St. Francis	46 8 6
— J. Vallé	St. Regis	41 15 8
— E. Foucher	Ristigouche	69 12 10

The Indians in Upper Canada, and on the shores of Lake Huron, and to the westward, amount, by the returns, to 13,700: 5000 of these reside in the surveyed districts of the province, and attend constantly to receive their presents at the time appointed.

Liabilities and Assets of the Bank of England, on the Average of the Quarter from the 26th of August to the 18th of November inclusive.

Liabilities.		Assets.	
Circulation,	£18,694,000	Securities,	£27,128,000
Deposits,	12,669,000	Bullion,	6,781,000
	£31,363,000		£33,919,000

Bankruptcy Analysis from October 27 to November 22.

Bakers, 2; baby-linen manufacturer, 1; bill-broker, 1; blacksmith, 1; booksellers, 2; book-binder, 1; boot-maker, 1; brewer, 1; builder, 1; cabinet-maker, 1; carpenters, 2; carpet warehouseman, 1; cattle-salesman, 2; cheese-factors, 2; china-man, 1; chair-maker, 1; clothiers, 2; coal-dealers, 2; coach-maker, 1; corn-factor, 1; draper, 1; dyer, 1; earthenware-manufacturer, 1; engineer, 1; feathers-merchant, 1; factor, 1; flour-factor, 1; grocers, 9; hatters, 3; horse-dealer, 1; hosiers, 3; inn-keepers, 2; jewellers, 2; lacemen, 2; lamp-manufacturer, 1; linen-drapers, 2; manufacturer, 1; mercer, 1; merchants, 5; millers, 2; money-scrivener, 1; perfumer, 1; picture-dealers, 2; preparer of patent medicines, 1; printer, 1; provision-dealer, 1; saddler, 1; ship-owners, 2; ship-builder, 1; shoe-makers, 2; soap-manufacturer, 1; stone-mason, 1; straw-hat manufacturer, 1; surgeon, 1; tailors, 3; tanners, 2; tavern-keepers, 2; timber-merchant, 1; victuallers, 3; watch-makers, 2; wine-merchants, 3; woollen-manufacturers, 2; woollen-drapers, 2; worsted-spinner, 1; underwriter, 1. Total, 108. Total from the commencement of the year, 930.

POLITICAL RETROSPECT FOR NOVEMBER, 1834.

GREAT BRITAIN.

On the morning of Saturday the 15th an extraordinary sensation was occasioned by the announcement that the Ministry had been dismissed by the King. It appeared that Lord Melbourne had gone down to Brighton on Thursday to take his Majesty's commands as to the appointment of a new Chancellor of the Exchequer in the room of Lord Althorp, removed by the death of his father to the House of Peers; and that when he attended his Majesty on the following morning, he was informed that in the circumstances his Majesty considered the Administration to be dissolved. It is understood that this communication was accompanied by expressions of much kindness to Lord Melbourne, and that an earldom and the order of the garter were offered to his lordship, both of which, however, were respectfully declined. His lordship returned to town in the evening, bringing with him a message for the Duke of Wellington, who accordingly arrived at Brighton on Sunday afternoon. On Monday the King came to town and held a court, when their seals of office were delivered up by several of the members of the late Cabinet. On the Friday following, the great seal was delivered up by the Lord Chancellor. In the meantime, the Duke of Wellington had been appointed principal Secretary of State; and Lord Lyndhurst has since been sworn in as Lord Chancellor, retaining likewise his office of Chief Baron of the Court of Exchequer. The Duke of Wellington has also been Gazetted as First Lord of the Treasury. It is understood, however, that nothing beyond a provisional arrangement of the new Cabinet will be made till the arrival of Sir Robert Peel, for whom an express has been sent to Italy, and who may now be expected in London in the course of a few days.

These events, for which the public was so wholly unprepared, have produced, as was to be expected, no small degree of surprise and excitement in all parts of the country. Meetings have been already held, in many places, both by the friends of the new Administration and by their opponents, comprehending both the Whigs and Radicals, who in general have agreed to lay aside their differences at so great a crisis, and to unite their strength in support of what they consider to be a common cause—resistance to the ascendancy of the principles of Toryism and anti-reform. Meanwhile, all is uncertainty as to the course likely to be pursued by the new Ministry. The very composition of the Cabinet, as has been mentioned, remains to be arranged. It is not known, nor probably determined, whether the premiership will be eventually assigned to the Duke of Wellington or to Sir Robert Peel. No resolution appears to have yet been taken as to whether an attempt should be made to go on with the present House of Commons, or a dissolution of Parliament resorted to. No declaration has been made as to what will be the general policy, either domestic or foreign, of the new government; and, probably, that also is left in a great degree an open question, to be decided upon according to circumstances.

Meanwhile, Parliament has been further prorogued to the 18th of December.

FRANCE.

The last thirty days have been unusually fruitful in cabinet dissensions, dismissals or resignations of ministers and whole governments. Marshal Gerard, who had only been some three months at the head of the French Cabinet, sent in his resignation on the 27th of October. This resignation is said to have proceeded from a refusal on the part of the Marshal's colleagues to grant a general amnesty to political offenders.

The Moniteur, of the 30th of October, contained the royal ordonnance, countersigned by M. Persil, Minister of Justice, by which the resignation of Marshal Gerard was accepted, and Admiral De Rigny appointed to act in his place, *ad interim*, or until a proper successor to the marshal could be found. For some days this cabinet without a head was in a most embarrassing position. The writers in newspapers and other political speculators at Paris, indulged in surmises and assertions. According to them the premiership or presidency of the council, had been successively offered to, and refused by the Duke de Broglie, Marshals Mortier and Molitor, Count Molé, and even Marshal Soult. On the 4th of November, in their inability to find a premier anywhere, Admiral de Rigny, Messieurs Thiers, Guizot, Humann, and Duchatal, all sent in their resignations. The only remaining members of the old cabinet then, were M. Persil, the Minister of Justice, and M. Jacob, the Minister of Marine. On the 5th it was officially announced that his Majesty Louis Philippe had charged Count Molé with the recomposition of the cabinet, in which, it was rumoured, but not officially, that the king insisted M. Thiers should be included.

After nearly another week of conjecture, to the surprise of everybody, the Moniteur gave the official list of the new ministry, consisting, with two or three exceptions, of men unknown to the world, and little known to each other.

The Duke de Bassano (old Maret, an obsequious servant of Napoleon), President of the Council; M. Bresson (am-

bassador at Berlin) Minister of Foreign Affairs; Lieutenant General Bernard, Minister of War; M. Charles Dupin, Minister of Marine; M. Teste, Minister of Commerce; M. Passy, Minister of Finances; M. Persil retaining the Justice department. Until M. Bresson's arrival from Berlin, the foreign department was to be filled by General Bernard, the Minister of War, and M. Teste was to do the duties of Minister of Public Instruction, until the answer and acceptance of M. Sauzet, to whom the last-named place was set down, could be received from Lyons, where he was residing at the time.

The list and history of this extraordinary ministry, ought to be preserved as an historical curiosity. In all other respects it is valueless.

The same Moniteur that contained these almost incredible appointments, announced that the Chambers of Peers and Deputies were to assemble on the 1st of December, instead of the 29th of that month, the period fixed in August last.

On Thursday, the 13th, M. Sauzet's answer, being a refusal to join the new ministry, arrived; on Thursday evening Messieurs Teste and Passey resigned; on Friday morning M. Charles Dupin notified his retreat; and on Friday evening, on the same day, and nearly at the same hour that our King dismissed the Melbourne cabinet, the Duke de Bassano and General Bernard tendered their resignation to the King of the French. Louis Philippe quietly allowed all these retreats, and remained alone, with M. Persil, as the government of France. We have thus, at this moment, the novel spectacle of the two great constitutional monarchies of Europe (if we may still apply the term to France) left without any government, that can be properly so denominated.

It has been calculated that if M. Bresson accepted the invitation, left Berlin, and travelled diligently, he may have arrived at the French frontiers just in time to learn that the new ministry he was hurrying to take part in, no longer existed. The whole existence of the Bassano cabinet, indeed, fell short of four days, and has thus we believe, the unenviable distinction of being the shortest-lived cabinet that was ever created.

The Parisians, who are happy at nick-names, and fond of analogies and parallels of all kinds, have already christened it "The Ministry of Three Days."

The Duke de Treviso having been appointed President of the Council, MM. de Rigny, Duchatel, Thiers, Guizot, Humann, and Persil, have returned to their former offices, the departments of Foreign Affairs, Commerce, the Interior, Public Instruction, Finance, and Justice. The office of Minister of Marine is not yet filled up, but its duties are provisionally performed by Admiral de Rigny.

SPAIN.

THE last "final arrangement," of the long disputed foreign loan questions that has reached us, is, that the Procuradores, by a majority of eighty-five to thirty, have revived the Guebhard loan, and placed it with the rest, as a debt justly owing by the nation. Although there were certain facts connected with the mode in which this Guebhard loan was raised, that might set it somewhat apart from the general international law or usage that regulates debts contracted in the name of a nation, we cannot help thinking that in the circumstances in which they were placed, the Cortes ought to have come to this *last* decision *at first*, and not to have gone on shifting their ground, and changing their votes some nine or ten times, as they have done with respect to this said loan. With a full knowledge of the deplorable state of Spanish finances, and of the urgent need in which the government stands, of new foreign loans, the world now will never believe that this tardy recognition has proceeded from any other motives than fear and necessity. The last debate on the question was sufficiently loud and angry. The arguments of several of the Procuradores who voted in the minority, abstractedly considered, were right and just enough; but practical experience, and policy should have taught them that they were not in a position to rely upon abstract principles, and that they could not cause delay, and create an hostility in the money markets of Europe, without inflicting injury on their cause, and exposing their country to imminent risks.

The war in the north has lingered on with the same inglorious vicissitudes (on both sides) of indecisive skirmishes and retreats. One affair was announced of great military importance, but in a few days the battle of Abarzuza (near Estella) in which both parties claimed the victory, turned out to be one of the usual retail slaughters that lead to no great result. On the whole, however, it appears that Don Carlos has gained a little ground, and that his partisans have shown themselves beyond the frontiers of Navarre and the Biscayan provinces, at points where they were not expected. The news of the substitution of a tory for a liberal ministry in England, will however, do more for the cause of Don Carlos, than a hundred of Zumalacarreguy's forays. We may not believe that in its strict sense such a change will or can take place among us; but foreigners, led away by old names and associations, will most assuredly believe that the change has taken, or will take place—hence will proceed the discouragement of the constitutionalists and a revival of the hopes of the absolutists, from one end of the peninsula to the other,—in Spain as well as in Portugal.

The veteran Mina, who, as we informed our readers last month, was appointed to succeed Rodil in the command of the queen's forces in the north, entered Spain on the 30th of October, from France, where his long exile has chiefly been spent. He immediately promised to secure the communications between the French frontier and Victoria in a few days, and to free all that line of country from insurgents. From his head quarters at Pampeluna he issued an energetic proclamation on the 4th of November. We regret to see that he threatens to give no quarter to the Carlists. This experiment had already been tried by Rodil, who thereby only made the petty combats more sanguinary without rendering them much more decisive. "I offer them peace," says Mina's proclamation, "but should they refuse it, and oblige us to draw our swords, we *will pursue without quarter* all those enemies of their country, and will be as terrible in avenging the most trifling injury done towards us, as we will be indulgent towards those, who from this day shall repent, and become reconciled with their native land."

In another proclamation addressed to the people of Navarre, after reminding them that they are acquainted with his unflinching character, and fully aware that he never speaks in vain, he goes on to say, "Should you persevere in revolt, and compel me to bring into action the power of the army, and the other means placed at my disposal, when reduced to that extremity, neither prayers nor entreaties will avail to avert the rigour of the measures which I have meditated, and shall enforce without mercy. "*I therefore warn you that every individual the troops shall meet, from this moment, at a distance from the high road between the hours of sunset and sunrise, who shall not be able to give a satisfactory account of himself, shall be immediately shot.*"

These proclamations and menaces, like those of Rodil, have been met by their counterparts on the side of the Carlists. Meanwhile one slaughter is retaliated by another on both sides, prisoners and officers of distinction have been shot in cold blood, and the unnatural contest between countrymen seems more and more verging to a war of extermination.

Of course each side invokes legitimacy and right, and the protection of a just Providence. Zumalacarreguy's last proclamation states that, "setting aside all the delicate considerations he has hitherto observed towards the queen's troops, and availing himself of the law of reprisals, he now decrees,

1. "All prisoners taken from the enemy, of whatsoever rank or class they may be, shall be shot as traitors to their legitimate sovereign.

2. "In all the corps and battalions under my command the motto *Victory or Death* shall be adopted and used until the enemy recal their order for not giving quarter."

Some advantages which Mina is said to have gained in Navarre and Biscay, seem to be more than counterbalanced by the advance in Aragon of a strong body of Carlists commanded by Carnicer and other chiefs, and by a disposition shown pretty generally by the population of Catalonia to take up arms against the queen. It may be curious to remark that while in the old kingdom of Castile, no constitutional objection was ever taken to the succession of a female to the throne, in the old kingdom of Aragon, on the contrary, an opinion gained ground from the thirteenth century, that none but males could inherit the crown of that realm.

They knew that in the neighbouring kingdom of France women were excluded from the throne; they fancied or pretended that such was the case also in England, and this analogy is supposed to have had some influence in determining the Aragonese to adopt what is so vaguely called "The Salic Law." The question was first put to issue by Peter IV. of Aragon, who excited a civil war by attempting to settle the succession upon his daughter, to the exclusion of his next brother; precisely as the late king of all Spain, Ferdinand VII. named his daughter Isabella, to the exclusion of his brother Don Carlos. The opportune birth of a son to Peter IV., suspended the decision for the time; but it seems to have been tacitly understood that the Salic law should obtain. Indeed, at the end of the fourteenth century, when John I. died, his two daughters (his only children) were set aside to make way for their uncle, Martin, who ascended the throne, and remained upon it, though not without a civil war. On the death of Martin without children, there was a disputed succession. Four princes put in their claims; but those of the Count of Urgel, who possessed an extensive territory in Catalonia, touching on the Pyrenees (the same mountain district that now seems to incline to Don Carlos) entitled him to a precedence over the other claimants. The count, who was a brave and popular character, was in general favoured most enthusiastically by his countrymen the Catalans, who never forgave his exclusion from the throne. They joined him in a rebellion against the elected king, which was, however, unsuccessful, the Count of Urgel being defeated, about 1412, and lodged in a prison for the rest of his life. Yet fifty years after these events, the Catalans, whose disaffection was principally to be traced to what they considered a breach of the lawful succession, rose up in arms, and persevered, with inveterate obstinacy in a civil war for ten years. Now, it is not unreasonable to suppose that among a people like the mountaineers of the north of Spain, whose education, local attachments and notions, prejudices and other feelings, have undergone so little change since the end of the fifteenth century, these traditional recollections may still have some effect in favour of Don Carlos and in support of the Salic law. Be this as it may, in a kingdom formed in the process of ages by the gradual union and incorporation of separate kingdoms, principalities and seigneuries, nothing in that compound body ought to be overlooked, that tends to draw a line of separate interests or prejudices, between any part or parts of it. That such differences should exist is much to be regretted, but they *do* exist. Three centuries of despotism and undivided sovereignty could not change them, and yet the Cortes, pretending to work with liberal and constitutional means, would effect a change and a uniformity in a day. We believe, or we hope, that it may be yet in the power of these legislative bodies to detach the people in Navarre, the Biscayan provinces, and Catalonia, from the cause of despotism,—not by arms and massacres, and the burning of villages and peasants' cottages, but by concessions and pledges that their local privileges shall be preserved to them. There is, however, no time to lose, for a few weeks or months may bring forth events to retard the march of liberty and leave us to lament another abortive attempt at establishing a constitutional government for Spain.

The minister of war, Zarco del Valle, has been driven from office by the clamours the Cortes raised against the ill success of the war in the north, which ill success they attributed to his mismanagement. Martinez de la Rosa, the head of the cabinet, took the war portfolio *ad interim*, but intelligence has just reached us of De la Rosa's entire resignation of office, on the plea of bad health. If this last account be correct, Martinez de la Rosa has been succeeded by the Minister of Finance, the Count de Toreno, and Señor M. Remisa has taken the Count's place.

We perceive that our tory newspapers, with that kindness of heart which distinguishes them, are in an ecstasy of delight in contemplating the panic and confusion that the intelligence of the summary change in the British cabinet will carry into the court and councils of the young Queen, and into the ranks of the Spanish constitutionalists generally.

PORTUGAL.

Since the death of Don Pedro, the government has been managed by the Duke of Palmella, who has encountered much personal hostility and many difficulties in the discharge of his office. The members of his cabinet have been constantly quarrelling among themselves.

On the 1st of November the Chambers violently discussed the question regarding the legality or illegality of Palmella's appointment as president of the council of ministers. The question was decided in favour of the duke by a majority of eleven—fifty-three voting for his remaining at his post, and forty-two against it. The opposition, which is wholly of an ultra-liberal or radical character, is headed by a man of vehement passions, Marshal Saldanha, who has been deprived of his office of chief of the staff. This party is just as short-sighted and rash as it was in 1821, 1823, and 1826, at which several times the cause of constitutional freedom was chiefly sacrificed, and brought into disrepute with the people, through the utter madness of the ultra-liberals, who in Portugal, as elsewhere, are the worst enemies of real liberty. Uninstructed by the past, these men continue to fight the battle of the absolutists of Europe. They are all for sudden and extreme measures, when measures of caution and conciliation alone can offer any chance of enduring success;—they would pay no deference or respect either to the religious or political prejudices of the Portuguese people, which, confirmed by ages, are not to be changed at the will of theorists in a day, but removed only by the gradual progress of education. Were the consequences less fatal, we might laugh heartily at the proceedings of these novices in politics, who are constantly cutting blocks with a razor, and consuming that time which ought to be devoted to *practical* reform in administration, public instruction, and the general business of government, in weaving fine-spun theories, and devising a *beau-ideal* of a constitution for a people that are as yet incapable of understanding the simplest theory, or of catching the proper spirit of the most homely constitution.

The Duke of Palmella is supported in the cabinet by the frank and honest Duke of Terceira, the Count of Villa Real, and Joze de Silva Carvalho, the minister of finance: but at present it is matter of doubt whether he will be able to manage the Cortes, and check the progress of the movement party, by remaining in office.

Admiral Napier, whose extraordinary victory off Cape St. Vincent first gave a favourable turn to the affairs of the constitutionalists, has been quarrelling with the government about money, and the amount of the remuneration to which he considers himself entitled. According to the arrangement of the young queen's government, he was to receive upwards of 20,000*l.* for his share of the prize-money, and, as a gratuity on his quitting the service, two years' pay, or more than 7,500*l.* His name, moreover, was to remain on the Portuguese navy and army lists as admiral and major-general of marines. He claimed, in addition, half-pay as an admiral, half-pay as major general, and the same as inspector of dock-yards; and these being positively refused him, he struck his flag, and returned all his commissions and patents of nobility, with the desire that they might be laid at the queen's feet. After some disputing and corresponding, the business was settled by a compromise, Donna Maria signing a Carta Regia, allowing him half-pay as an admiral, and Napier waiving the rest of his claims. The Carta Regia, however, must be submitted to Cortes, and meet the approval of the legislature, before it is valid. In consequence of this arrangement, Napier has again taken up his title of Count Cape St. Vincent, &c. &c.

One of the great outcries of the opposition is that against honours and favours conferred upon foreigners. Some men there may be inclined to tax Portuguese gratitude rather heavily, but these ultra-liberals ought not to forget that but for foreigners Don Miguel would be still on the throne, and they themselves in prison or in exile.

Where the Don now is cannot be exactly ascertained. The Lisbon Official Gazette of the 25th of October contained a proclamation of General Salvador, Captain-general of Spanish Estremadura, dated Badajoz, the 20th of October, informing the inhabitants, that as it is ascertained that Don Miguel has joined Don Carlos in Navarre, and may possibly attempt an ingress into Portugal, he offers a reward of 1000 dollars to any person that shall take and hand Miguel over to the Spanish authorities, stating at the same time that if the captor should decline the pecuniary reward, the Spanish

government will confer some honourable one upon him instead.

This alarm was certainly premature, for the Don has been heard of in Italy since then. We can readily believe, that owing to the church and monastic decrees of his brother, Don Pedro, he was received with marked attention by the churchmen at Rome. It was rumoured in that city that he had addressed the great northern powers, in order to obtain assistance from them, and that he was about to be married to a daughter of the Duke of Modena—the least scrupulous, the most crafty and tyrannical of all the small Italian despots. On the same doubtful authority it is now stated that he has left Italy to throw himself into Portugal or Spain. No event is likely to encourage him more in such an enterprise than the change in the government of Great Britain, the news of which will soon reach him, be he where he may.

The Lisbon official paper of the 3rd of November contained an angry remonstrance and complaint about the unfriendly dispositions of the northern powers towards the constitution and new state of affairs in Portugal. "But," the said article concludes, "in spite of stratagem and imposture, and of the news of the arrival of Don Miguel in Spain, such is the discredit into which he has fallen, that no sign of hope has been manifested by his defeated and contemptible party, who have only had recourse to the invention of most wretched falsehoods, which are every where rejected by the good sense of the people."

As a serious drawback on these ministerial assertions, we have the undisputed facts that assassinations for political motives have continued to be frequent in Lisbon, and that many parts of the provinces are in a state of anarchy. We have also their own confession as to the ruinous condition of the Portuguese Exchequer, and the great public poverty and distress that have arisen out of the long disasters of the nation.

The sword of Don Pedro, as directed by his will, has been presented at Munich, by a Portuguese of rank, to the young Duke of Leuchtenberg, the husband elect of Donna Maria. It is said the duke will forthwith repair to Portugal, and that three days after his arrival at Lisbon the marriage will be solemnized.

It is scarcely necessary to say that the Cortes have unanimously voted the exclusion of Don Miguel and his heirs for ever from the Portuguese throne. We, in fact, greatly fear from the imprudence of the now prevailing party, and from a variety of other circumstances, that this question will again be tried by arms, to the increasing and indefinite misery of that hapless country.

BELGIUM.

THE Chambers were opened at Brussels on Tuesday the 11th of November. King Leopold, in his speech from the throne, assured them that his government was daily strengthened by the acknowledgment and friendly assurances of foreign powers. Since his last speech, Spain, Portugal, and Brazil had been added to the list. He declared the state of the finances to be highly satisfactory, but at the same time promised further economy, and a greater attention than ever to all laws and regulations having for their object the development of the agricultural and commercial interests of the country. Content and good order prevailed everywhere, and the king added his personal testimony to the prosperity of Belgium in all the provinces which he had recently visited. The following short clauses of Leopold's speech merit particular attention:—

"An arrangement recently concluded with the British Post Office has doubled the means of communication between England and Belgium, and holds out a prospect of advantageous results to commerce.

"The construction of our railroad proceeds with great activity. Up to this period there is reason to hope that the expense will be less than the first estimate."

The discipline and condition of the army, in all its branches, merited his Majesty's praise. The only cause of complaint was the trouble occasioned by certain ill-affected foreigners, who were thenceforth to be dealt with in a summary manner.

King Leopold did not let a word escape him on the subject of the prolonged disputes about the province of Luxembourg, and was equally silent on every other point of the still unsettled question between Belgium and Holland.

HOLLAND.

THE session of the States General was opened at the Hague on the 20th of October, by the King in person. In the first clause of his speech his Majesty was happy to inform their High Mightinesses that his relations with the foreign powers were, on the whole, satisfactory, and that he continued to receive from many of those powers testimonies of sincere friendship. He added, however, the following very unsatisfactory sentence:—

"I have been constantly deceived in my just expectation of a final arrangement of the rights and interests of Holland, which have been so undeservedly injured by the *Belgian insurrection.*"

His Majesty lamented the heavy expenses he had incurred in increasing his regular army and navy, and keeping the schuttery (militia) so long under arms. The militia and the volunteers on board the ships of war had, however, been permitted to return to their homes and their industrious vocations, which would materially decrease the expenditure of the ensuing year. There were the usual clauses about the winter damages sustained by the dykes and sea-banks—about prosperous trade and manufactures, and about the Dutch colonies in the West Indies and the East Indies, where, it was admitted, tranquillity had suffered interruptions in part of the island of Sumatra. The following clause will show that the complaints of the agricultural interests are not confined to England:—

"The low price of corn," said his Majesty, "has had an influence on the agriculture of Holland, and it participates in the fate which that branch of national prosperity experiences in other countries."

Projects of law "*for revising some part of the commercial code,*" and for the better regulation of maritime affairs, were recommended to the attention of the States General; and the speech concluded with a compliment to the Dutch people, who were praised for being "faithful and calm under unmerited sufferings, and alien from a love of political novelty."

GERMANY.

THE newspapers of this country have been for some time almost wholly occupied by the subject of internal trade, and a general Germanic commercial league. These matters, which have been actively pursued, and more particularly by Prussia, during the two last years, are as yet involved in some obscurity. It appears, however, that some final decision is at hand. Various German papers of the 1st, 4th, and 5th of November, assert that a congress, wholly commercial, and to be composed of envoys from all the states of the Germanic body, is to be assembled before the end of the present year at Berlin, in order to decide ultimately on the mercantile matters that were not touched or settled by the recent political congress at Vienna. The subject is one of primary importance; and as soon as a proper knowledge of it can be obtained, we will devote a separate article in the 'Companion' to its consideration. The object of the confederacy seems to be to lay greater restrictions on the trade with England, France, and other foreign countries, and to give greater liberty and facility to the interior trade of all Germany, and to the commercial relations with one another, of the numerous separate states into which that country is divided.

Destructive fires have prevailed to an extraordinary degree in different parts of Germany, and, as in the present shackled state of the press, there are few subjects the newspaper people daré handle, they seem disposed to make the most of this. Nowhere have these fires been so prevalent at at Berlin, where, from their number and extent, it is apprehended that the insurance offices will be unable to meet their engagements.

The latest German papers give a long account of the sitting of the Germanic Diet of the 30th of October, when Count Bellinghausen, the president, *in conformity with the decision of the Congress of Vienna,* produced a new system, or plan, for a Tribunal of Arbitration, which tribunal is to settle the differences that exist, or may hereafter occur, between the several governments and states of Germany.

The clauses and provisions are tediously long, and involved; but it appears to us that in this arbitrating, political tribunal, the interests and inclinations of the small and weak states must constantly give way to the will of the great states.

CHRONICLE OF OCCURRENCES.

October 26.—Seven individuals lost their lives owing to the confusion which unhappily ensued from the accidental extinction of several of the gas-lights in a chapel at Guernsey during divine service.

29. A great public dinner was given to the Earl of Durham at Glasgow. During the previous part of the day he was presented with the freedom of the city, and received a great number of addresses from various bodies. The numbers in the green or public park of Glasgow were calculated at from 100,000 to 150,000.

30. A public meeting was held at Hillsborough, in the county of Down, Ireland, for the purpose of expressing attachment to the Established Church and the legislative union between Great Britain and Ireland. The Earl of Hillsborough, high-sheriff of the county, was in the chair, and the meeting was addressed by Lords Downshire, Londonderry, Roden, Clanwilliam, &c. The numbers present were variously estimated by different reporters at from 27,000 or 28,000 to 60,000.

November 1.—The East India Company's Wharf at Blackwall was sold to Mr. Nicholson the tea-dealer for 25,000*l.*

— A placard affixed to the police station-house, Tottenham, intimated that in consequence of the refusal of the overseers of the parish to collect the police rate, the station-house would be shut up, and the police be withdrawn, which was accordingly done.

— The new metropolitan central criminal court was opened this day by the Lord Chancellor and the judges, attended by the civic functionaries. In the evening, an entertainment was given at the Mansion-house by the Lord Mayor, in honour of the event.

Incendiary fires have also occurred, with alarming frequency, in different parts of England. The 'Lincolnshire Chronicle,' 'Dorset Chronicle,' 'Cambridge Chronicle,' 'Birmingham Advertiser,' and 'Oxford Journal,' give details of fires in their respective neighbourhoods, from the 1st to the 8th instant, all of them supposed to be the work of incendiaries. In most of the cases the owners are insured.

2. The celebrated Archibald Hamilton Rowan died at Dublin, in his eighty-fourth year. The connexion of Mr. Rowan with the Irish rebellion, his trial, escape, &c., are well known. His private character was of the most amiable description.

— Messrs. Hunt and Co., who are extensively connected with iron-foundries in Cornwall, brought an action against an engineer named Radcliff, who carries on business at Paris. The case was tried before the Tribunal de Commerce. The action was for goods delivered, which the defendant refused to pay. The French tribunal decided that as Radcliff carried on business in the French dominions, and had received the goods there, he was amenable to the French law, and adjudged him to pay the money.

6. The attorney-general moved, in the Court of King's Bench, for writs of *certiorari* and *habeas corpus*, to remove the conviction recorded against Garside and Mosely, convicted of the murder of Mr. Ashton at Oldham, into that court, and to bring up the bodies of the criminals to abide the sentence of the law. The attorney-general produced various cases in order to show that the Court of King's Bench had formerly exercised the jurisdiction which he sought, among which was that of the celebrated Sir Walter Raleigh. The writs were granted, and the prisoners were brought up from Chester, and on the 20th they were brought into the Court of King's Bench, when the sentence of death under which they lay was ordered to be carried into execution on the 25th, by the marshal of the Marshalsea, aided by the sheriff of Surrey, which was accordingly carried into effect.

— An application was made in the Court of Exchequer for a new trial in the case of Cleave, who had been convicted of selling an unstamped newspaper called the 'Weekly Police Gazette.' The application was refused.

— In the Court of Common Pleas, a new trial was moved for in a cause between a person who had been confined for debt in Horsemonger-lane Gaol, and the late high-sheriff of Surrey, Sir Henry Fletcher. It appeared that while the former was in prison, information was communicated to the turnkey that an attempt would be made by him to escape, a ladder of ropes being actually making for the purpose. The turnkey, on this, removed him from the debtors' side, and placed him in a condemned cell on the felons' side of the prison. An action had been brought for the unnecessary rigour thus exercised, against Sir Henry's predecessor in office, in which the prosecutor was nonsuited, the turnkey refusing to name the individual who had given the information, and the judge justifying the refusal, on the ground of policy. On the second trial the informant was produced, and the prosecutor was again nonsuited. On the present occasion, counsel moved for a new trial on the ground of surprise, no intimation having been given of the intention to produce this witness, and affidavits had been since sworn to by the men who had made the ladder, that it was not intended for the prosecutor at all. As it appeared that the prosecutor had been rigorously confined for several months, and it being a case of considerable importance, a rule to show cause was granted.

— A destructive fire occurred at Rotherhithe, which consumed the Europa Inn, and twelve houses, principally inhabited by poor people. Three lives were lost. A subscription was commenced for the relief of the sufferers (there being nearly fifty families unhoused), to which her Majesty contributed 50*l.* Another fire has since occurred there, supposed to be the work of an incendiary.

7. In the Court of Chancery an injunction was granted at the suit of Messrs. Ridgway and Son, booksellers, to restrain another bookseller named Henderson, from pirating 'Edwards's Botanical Register.'

8. Two gentlemen of the name of Neale, one of them the author of 'Cavendish,' and other works of fiction, were charged by Captain Marryat, author of 'The King's Own,' and other productions, and editor of the 'Metropolitan Magazine,' with assaulting him in the street. They were held to bail to answer the charge at the sessions.

10. The new lord mayor of London (Alderman Winchester), attended by the various officers of the corporation, proceeded, according to annual custom, to Westminster, in order to be sworn before the barons of the Exchequer. The usual processions took place, and the inauguration dinner in the evening was attended by several of the ambassadors and ministers of state, the judges, and other persons of distinction.

— The boiler of a high pressure engine, in the foundry of Ayton and Read, in the vicinity of Hull, burst, and the explosion caused considerable damage. The upper part of the boiler was projected nearly 200 yards, and fell into the Humber, the steam-engine chimney was thrown down, some of the workmen were injured, and a youth employed on the premises was killed.

— A respectable master jeweller was charged at Hatton Garden with having unlawfully affixed a certain hall-mark of the Goldsmiths' Company to a gold ring. The solicitor of stamps attended for the purpose of prosecuting the prisoner for the forgery of the assay mark, which would have subjected him, had he been convicted, to the extreme penalty of the law. This course was afterwards abandoned, and he was held to bail on the lesser charge preferred by the Goldsmiths' Company.

— Earl Spencer died at Althorpe, in Northamptonshire. He had entered his seventy-seventh year. He was First Lord of the Admiralty during the period of the great naval victories of Camperdown, Cape St. Vincent, and the Nile. The latter part of his life was spent in retirement.

— Some ruffian having placed a large piece of wood across a particular spot on the Stockton and Darlington Railway, the engine, on coming in contact with it, was overturned, and the engineer, being jerked out, was crushed to death.

— The house and shop of a pawnbroker in Norton Falgate was consumed by fire. It is generally understood that the law provides no remedy against losses by fire of property pledged with pawnbrokers.

11. A petition was presented before the Vice Chancellor in Chancery from a tailor, praying for leave to bring an action against the executors of a late captain of the Life Guards, for clothes and money lent, to the amount of 3421*l.* The captain's account with the tailor was opened when he was only eighteen years of age. The items of the account comprehended 51 coats, 100 pairs of trowsers, 119 waistcoats, 8 great coats and cloaks, and 6 dressing-gowns, all of which had been ordered within a few years. The Vice Chancellor dismissed the petition with costs, remarking, Every person must be struck at this frightfully extravagant and ruinous sort of debt against a spendthrift young man. When an opportunity is given to tradesmen who are unprincipled enough to enter into such transactions with young men, the honest customer who will pay is defrauded by the advance of price to make up the losses occasioned by such speculations.'

— The papers state that a vessel is announced to sail from Liverpool on a voyage round the world, in which cabin passengers may be accommodated at 150*l.* each; and also that similar trips are to take place every six weeks!

— A reverend gentleman of the name of Small absconded from St. Alban's with a large amount of money with which he had been entrusted. A considerable part of it was the savings of industrious people in the neighbourhood, who were in the habit of depositing little sums with him, that he might place the money to their account in the savings bank at Hertford. Another portion consisted of the subscriptions for repairing the abbey, he having been treasurer to the committee for raising the abbey repairing fund.

13. It was stated in evidence before the magistrates of Bow-street, that upwards of 2800*l.* had been paid to common informers within twelve months, for the purpose of compounding informations against the proprietors of hackney carriages. The complaints against omnibus and cab drivers, &c. are not diminishing, and legislative interference is loudly called for, to protect the public from the consequences of the misconduct of these individuals.

— A conditional order for an attachment was granted in the Rolls Court, Dublin, against a Miss Lucinda Adamson, of Moate, who had told a process-server of the court that if he attempted to take her into custody he might get his coffin prepared, and arming herself with pistols frightened the man away.

15. In the Rolls Court, Westminster, an injunction was issued to restrain the agents in this country for the sale of a 'Catholic Penny Magazine,' published in Dublin, from selling any numbers of the work containing pirated copies of the woodcuts in a work entitled 'Scriptural Illustrations.'

— Lord Stanley was elected Lord Rector of the University of Glasgow. The opposing candidate was the Earl of Durham. The votes of the students stood as follow:—

	Lord Stanley.	Lord Durham.
Glottiana	125	63
Rothesiana	84	42
Londoniana	43	37
Transforthiana	46	21
	298	163
Majority for Lord Stanley		135

The first week in December is named for the installation of Lord Stanley, and it is said that the friends of the Kirk in Glasgow, and throughout the west of Scotland, intend to invite his lordship to a public dinner on the occasion.

17. A distressing scene occurred at Liverpool, arising out of an exhibition of a kind unfortunately not yet altogether put down—a pugilistic combat. Two individuals were to fight on the Cheshire side of the Mersey, opposite to the port of Liverpool. After the fight was over, a number of the spectators were returning in boats across the river, when one boat, which was overloaded, containing from forty to fifty passengers, was swamped and overset, and another boat, equally crowded, which came to render assistance, shared the same fate. It is calculated that about fifty persons were drowned.

— Notices were affixed against the church-doors along the intended line of road of the following extraordinary project, for which an application is to be made for the sanction of Parliament, during the next session. It is the formation of a tunnel for carriages and horses, to commence on the side of the hill at the western extremity of Oxford-street, and to be continued in a direct line under the whole length of Oxford street, under Holborn, and to emerge in or near Smithfield. To be continued thence above ground, by a rail-road to Aldersgate-street, when it is again to dip, and to worm a subterranean course through Whitechapel, and to terminate at the entrance to the Thames Tunnel. There are to be lateral tunnels, commencing under ground near Whitechapel church, leading to the East India, the West India, and the London Docks. The undertaking is to be maintained by tolls on carriages and merchandise passing along the tunnel. The notices are printed, but no name is subscribed, so as to afford a clue to the projector of this strange scheme.

— At the Perth Council meeting, the Lord Provost proposed that a rule should be adopted in Council, restricting each member to *one* speech only on any subject, admitting of a reply where necessary. This was unanimously agreed to.

— A public dinner was given to Mr. Cobbett in Dublin. Sir George Cockburn presided, and two or three Irish members of Parliament were present.

— Mr. Green, the well-known aeronaut, made a perilous ascent from North Shields, in a very large balloon. The balloon, from some accidental defect, could not be inflated sufficiently, so as to carry up along with it the car and other appendages. But the aërial voyager, being unwilling to disappoint the crowds who had come to witness the ascent, slung himself by a cord to the balloon, and essayed to ascend without car, grappling irons, or ballast. It rose only a few yards, and remained buoyant over the heads of the spectators, when Mr. Green threw off his hat, and it then ascended considerably. It was shortly afterwards observed to descend with alarming rapidity, and ultimately it came down on a deep part of the river Tyne with such velocity that Mr. Green was forced to the bottom (about nine feet and a half), and stuck in the mud. He had presence of mind, however, to retain his hold when he was extricated by the re-ascent of the balloon, and dragged along the water for about fifteen minutes, until he was picked up by a boat. Had the balloon fallen on the ground, it is very likely that the voyager's rashness would have cost him his life.

18. A fire broke out in the nunnery at Hammersmith, when an aged lady was burned to death, her body being found shockingly mutilated. It is supposed she had been reading in her room, and had accidentally set fire to her dress, and that the flames communicated to the apartment.

— The Earl of Hardwick died in his seventy-seventh year, at Tittenhanger House, near St. Albans. He was lord-lieutenant of the county, high-steward of the University of Cambridge, and a Knight of the Garter.

— A meeting of the parochial board of St. Clement Danes was held at the workhouse pursuant to a notice previously served on each member, "to consider and decide as to the visitations of Dissenting ministers to the inmates of the workhouse." A placard, headed "Bigotry and Intolerance," and imputing a design to exclude dissenting teachers, had been circulated during the day, but there appeared to be not the slightest foundation for such a suspicion, as the churchwardens and overseers, one and all, disclaimed any such intention. They explained that they had discovered, by accident, that four or five persons were in the habit of visiting the workhouse every Sunday, and preaching in the several wards to the sick and infirm, many of whom were in their beds, and others retiring to rest, the visits not being made until seven o'clock in the evening. These persons were very often of different persuasions, but were not ministers. They found four so engaged last Sunday, and on inquiring, found one to be a stonemason, another a shopman, and another a journeyman tailor; but certainly they were all persons of very excellent character, and so far there was no objection to them; but if persons were admitted indiscriminately, some evil-intentioned individuals might take advantage of it, and produce considerable mischief. It had been customary to allow preaching in the hall below on Sunday evenings, and that was continued, therefore they did not see the necessity of having preaching in each ward also, though they had no objection to individuals visiting the sick, but the visit should be made at an earlier hour. Mr. Woodward, the gentleman who felt most alarmed on the subject, expressed his satisfaction at the explanation given, and feeling that the churchwardens and overseers might avail themselves of the new Poor Law Bill to admit none but licensed Dissenting ministers, and then only at the request of an inmate, he cheerfully left the matter to the liberality they had evinced by their language. It was ultimately agreed to keep a book for all visiters to insert their names and addresses, and not to allow them up stairs after six o'clock, but to permit preaching in the hall below, without reference to sect or party.

— Two men lost their lives under the following circumstances: one of them, a plumber of considerable experience, and much respected, residing at Penshurst, was employed at a farm in the neighbourhood to repair the leaden pipes in a well, the mouth of which had been closed for years, and which had only been unclosed for an hour before his descent. On descending, the noxious effluvia overpowered him and he fell; his brother, who descended to rescue him, was also overpowered: and a third person who was let down with a rope round his waist, had to be drawn up without being able to render any assistance to the two men, having himself fallen into a state of insensibility. The bodies of the two sufferers were not raised for upwards of an hour afterwards.

19. A dinner was given to Earl Durham at Newcastle-upon-Tyne.

20. A dinner was given at Ashford, in Kent, to commemorate his Majesty's late declaration 'to support the constitution in church and state.' The dinner took place at the Assembly-rooms, and was attended by nearly 200 noblemen, gentlemen, and inhabitants of the county. Sir Edward C. Dering presided, supported by the Earl of Winchilsea and Viscount Strangford.

21. A notice was affixed to the principal door of St. Nicholas' Church, Deptford, of the intention to apply in the ensuing session of Parliament for authorising the construction of a pier or jetty on the south side of the river Thames, in the parish of St. Nicholas, Deptford, for the embarking and disembarking of passengers, cattle, and carriages, and levying a toll on all passengers, cattle, carriages, woods, wares and merchandise.

A baronetcy has been conferred by his Majesty on Mr. Felix Booth. It will be recollected that it was this gentleman's munificent assistance which enabled Captain Ross to undertake his expedition to the Polar regions.

West Indies.—The 'Dominica Observer,' of September 24, gives an account of a most destructive hurricane which had visited the colony. The atmosphere had been unsettled for some days preceding, but on Saturday the 20th of September, the storm commenced with unusual violence even for the season of the year, and during the night destroyed houses, property, and lives to an extent unequalled since the great hurricane of 1813. Five sloops in the harbour were totally wrecked; many estates suffered immense damage; and many houses were blown down, or partially injured. The governor issued a proclamation throwing open the port to the free importation of provisions and other articles of immediate necessity, for six months, in order to avert the danger of famine. A subscription had been commenced in Barbadoes for the relief of the sufferers, to which the House of Assembly had voted 750*l.* currency. A subscription has also been commenced in London for the same purpose.

Papers from Hobart Town and Sydney announce that on the intelligence arriving there of a charter having been granted to the Australian Bank, it was resolved to establish branch banks at Sydney, Hobart Town, and Launceston. All government monies are to be lodged in these banks, and all colonial salaries to be paid through them. Four per cent. is to be allowed upon all deposits, even for a month.

The well-known Baptist Missionary, Dr. Carey, died at Serampore on the 9th of June last. He had lived forty years in India, translated the New Testament into upwards of forty Oriental languages or dialects, and into many of these dialects the whole of the Bible.

RIGHTS AND DUTIES OF ELECTORS AND REPRESENTATIVES.

At the moment while we write, the public mind continues to be excited by the prospect of an immediate dissolution of parliament, and a new election, which promises to exhibit perhaps as general and determined a struggle between the adherents of opposite political opinions as has ever occurred in our history; and even if this appeal to the people should not be made immediately, it cannot, in all probability, be very long deferred. But our present observations have neither any mere temporary nor any party object. We wish to suggest some considerations connected with the relation between a representative and his constituents, to which it can at no time be improper or unimportant to call the attention of Englishmen.

It is usual to explain the nature and reason of parliamentary representation by resting it simply on the ground of the impossibility or great inconvenience there would be in the people attempting to legislate in general assemblies composed of their whole number. It is said that, as in any country of considerable extent such an assembly evidently could never be convened, and, if it could be convened, never could be kept together, and, if it could be kept together, would be a mere mob wholly incapable of deliberation, it becomes necessary for the people to give up the notion of conducting their affairs after this fashion, and, instead, to delegate for that purpose a manageable number of representatives selected from their entire body. These representatives, meeting in parliament, are considered to form each the deputy, commissioner, or attorney of the section of the people by whom he has been sent thither—the single mouthpiece, as it were, by which the sum of their wishes and resolves is collected and expressed in one distinct and intelligible voice.

Now it is certainly possible to conceive a representative system of which this statement should be a complete account. The people, sensible of the impracticability of the direct exercise, by their whole body, of the legislative function, but still desirous to retain the full legislative authority in their own hands, might, in the way that has been supposed, appoint a certain small number of agents or factors to do their business for them. In the ordinary course of affairs, these persons, who would most probably require in all cases to be paid wages like any other servants, would be able to go on without much direction or actual superintendence. Their simple rule would be to give their best attention to the interests, or rather the presumed inclinations of their employers: and whenever circumstances seemed to call for such interference the latter could always issue specific instructions for their guidance and regulation. They would be little more than so many acoustic tubes, through which the inhabitants of the several districts of the country might blow their commands to the legislative chamber. According to this scheme it might be desirable that a representative of the people should possess such a measure of common intelligence as should enable him to pick his way when left to proceed at his own discretion; but as his position would rather be that of the horse than that of the rider, it does not appear that he would need to have any higher qualifications than those of a docile and sensible beast of burden, obedient to the bit in its mouth, and patient of the saddle on its back.

How such a system might work if it were anywhere actually set up as a machine of national government we shall not pretend to conjecture; we apprehend it has only existed as yet in the shadowy realms of theory. At any rate it certainly is not the representative system of the British constitution. What that is, as distinguished from this plan of pure substitution and proctorship, we shall now endeavour to explain.

Parliamentary representation, in this country, does not by any means stand entirely on the ground that business can only be conveniently transacted in a small assembly. No doubt, even if there were no other reasons for the adoption of the expedient of representation, this would be reason sufficient; but the contrivance may also be made, at the same time, to serve much higher ends than this consideration embraces. The design of the British parliament contemplates not merely the substitution of a small assembly for a great multitude, but, in addition, the selection for the members of that small assembly of those persons in the community who may be deemed the fittest, from their ability or other qualifications, to legislate for the state.

The general body of the people must, of course, in every state, be the original source of all political power. No power or authority can be legitimate, or be other than usurpation and tyranny, which has not either been actually conferred by the people, or at least sanctioned by their unequivocal acquiescence; but it does not follow from this that it would be wise in the people to retain all the powers of the state in their own hands. It might be for the general advantage that some of them should be transferred to other depositories for a limited time, and even that some should be so made over in perpetuity. Thus in this country the chief executive power of the state has been given away by the people out of their own keeping into that of a hereditary king; and the judicial power, or power of administering the laws, has been confided to certain magistrates nominated for life. In the American constitution the executive power has also been entrusted, though not quite so unreservedly as among ourselves, to a single individual, the people however resuming the trust at the end of every four years.

Even if a constitution were to be formed for a country in circumstances which made it unnecessary to attend to anything except the abstract principles of political science, a great variety of considerations would require to be taken into account in determining the best forms and conditions under which the several powers of the state should be distributed: but the question becomes still more complex when it has to be looked to, as it almost always has, with a reference also to many peculiar features in the situation of the country and the habits and national character of the people. In any circumstances, however, there is one powerful reason, besides the mere consideration of convenience already adverted to, for the people divesting themselves, to a large extent, both of the actual exercise of their inherent rights of

[WILLIAM CLOWES, Printer, Duke-street, Lambeth.]

self-government, and even of any direct control over their exercise when transferred to other hands. Power can only be safely exercised when it is either strictly limited in its amount, or subject to the check of responsibility; but in the case of power retained by the people in their own hands, there can, in the nature of things, be neither responsibility nor limitation. Even in the most absolute of other despotisms there is something beyond and above the nominal autocrat—dormant, it may be, and not to be very readily aroused, but still sufficient to inspire some apprehension, some caution, some forbearance from acts of extravagant enormity: but here there is no stronger force whatever, which, even as a mere name or imagination, might make the abusers of power pause in their career. The intoxicated man and the madman are not more free from all sense of restraint. Now a whole people can no more stand this perfect abandonment to the license of its own will than an individual can. History testifies abundantly to this truth. The possession of great power severely tries the wisest and strongest heads. Is it to be expected that a mixed multitude should not turn giddy and stagger when thus placed above all law, all check, all fear? A wise people, if lifted to such a perilous elevation for a moment, by some extraordinary crisis of their history, will hasten to descend to a more secure position—will endeavour, as speedily as may be, to encompass themselves again with those barriers which are fitted to be not more their restraints than their supports—will, in other words, part as soon as they can with the greater portion of the power that has been thrown into their hands, and give it up to be exercised by other depositories with whom it can be more safely lodged.

This is what the people of this country have done with their inherent right of legislating for, and of governing themselves. They have appointed not only a King to rule over them, but also a House of Lords and a House of Commons to share the government with the occupier of the throne. To each of these several authorities they have conveyed a certain portion of power which was originally in themselves. It is this arrangement which forms what is called the Constitution.

To the king and to the members of the House of Lords the people have given certain powers, not only to be held during life, but to be transmitted, in most instances, to the descendants of the holders for ever. This is the constitution as it at present stands. Of these particular powers, therefore, the people may be considered to have permanently divested themselves. They cannot be resumed except by a revolution.

With regard to those powers which are entrusted to the members of the House of Commons, the case is different. These are granted only for a certain term of years, or until the crown shall be pleased to dissolve the Parliament for which the members are elected.

From this limitation of the period for which these latter powers are granted, some very strange inferences have frequently been drawn. It has been conceived that in their case the trust is in other respects also much less full and unreserved than that which is given to the king and the members of the House of Lords. Neither the people, for instance, nor any body of them, ever think of forwarding instructions to the king as to when he ought to call the Parliament together, to prorogue it, or to dissolve it; nor instructions to individual peers as to how they ought to vote on any particular measure. To these quarters the people convey their wishes only in the form of respectful petition; and even if they are not attended to, it is not conceived that any particular obligation has been violated. To members of the House of Commons, however, according to certain politicians, their constituents are entitled, whenever they please, to address their commands as to how they shall vote, or at all events to insist that if they will not vote in a certain way they shall resign their seats. This notion, it appears to us, proceeds from a total misconception of the purpose for which members are sent to Parliament.

In so far as the functions exercised by the House of Commons are concerned, the power which under the constitution the people retain in their own hands, is simply that of withdrawing the trust they have confided from any member at the end of a certain term; or on the occurrence of any one of certain specified contingencies, such as his acceptance of office under the crown, or the dissolution of the Parliament. Of all other powers which may be exercised by him as their representative, they divest themselves entirely by the act of electing him to represent them. After his election it belongs to him, and not to them, to decide what course he shall adopt in regard to any measure which he may influence by his vote. They have themselves conferred upon him this right. It is for the purpose of exercising this right that he has been sent to Parliament, and he does not fulfil his duty if he refrains from exercising it.

Mr. Burke has placed this matter in a very clear light in a remarkable passage of the speech in which he returned thanks to his constituents immediately after his first election as one of the members for Bristol. Adverting to an opinion which had been expressed by his colleague in favour of the coercive authority of instructions addressed to a representative,—a topic which it seems had been much agitated in that city, he proceeded as follows:—"Certainly, gentlemen, it ought to be the happiness and glory of a representative to live in the strictest union, the closest correspondence, and the most unreserved communication with his constituents. Their wishes ought to have great weight with him; their opinion high respect; their business unremitted attention. It is his duty to sacrifice his repose, his pleasures, his satisfactions, to theirs; and above all, ever and in all cases, to prefer their interest to his own. But, his unbiassed opinion, his mature judgment, his enlightened conscience, he ought not to sacrifice to you, to any man, or to any set of men living. These he does not derive from your pleasure: no, nor from the law and the constitution. They are a trust from Providence, for the abuse of which he is deeply answerable. Your representative owes you not his industry only, but his judgment; and he betrays, instead of serving you, if he sacrifices it to your opinion. My worthy colleague says his will ought to be subservient to yours. If that be all, the thing is innocent. If government were a matter of Will upon any side, yours, without question, ought to be superior: but government and legislation are matters of reason and judgment, and not of inclination; and what sort of reason is that in which the determination precedes the discussion; in which one set of men deliberate, and another decide; and where those who form the conclusion are perhaps three hundred miles distant from those who hear the arguments? To deliver an opinion is the right of all men; that of constituents is a weighty and respectable opinion, which a representative ought always to rejoice to hear, and which he ought always most seriously to consider. But *authoritative* instructions—*mandates* issued which the member is bound blindly and implicitly to obey, to vote, and to argue for, though contrary to the clearest conviction of his judgment and conscience. These are things utterly unknown to the laws of the land, and which arise from a fundamental mistake of the whole order and tenor of our constitution."

The mistake here spoken of, we will merely add, is one of an especially extraordinary sort to be made by the more zealous favourers of the democratic element of the constitution. It is by means of the House of Commons only that in the regular action of the constitution that element can make itself be felt. Whatever weakens the House of Commons as one of the powers of the state, diminishes the share which the people have in the Government. Over the Crown and the House of Lords they have preserved to themselves no means of direct control. The powers which they have bestowed upon both of these branches of the legislature have been bestowed not as a loan but as a gift, and are of course used not as a trust but as a possession. Revoked no doubt they might be by a revolution; but the case is as we have stated it, so long as the boundaries of the constitution are not overstepped. The periodical resumption, on the contrary, of the powers entrusted to the members of the House of Commons, necessarily keeps that house, at least to a certain extent, the organ of the popular sentiment. It is at any rate the only organ which the democratic principle has whereby to exert its force in the legislature. To lower, therefore, the authority and influence of the members of that house, by curtailing their liberty of independent action—to suffer them to be no more than a collection of puppets held in leading-strings by so many irresponsible bodies without the house, and incapable of moving except as they are jerked or twitched to the one side or the other by their masters behind their backs, while they have to sustain their position as the natural counterpoising and antagonist power to both the monarchical and the aristocratic principles of the constitution, strong as

both of these are in all the advantages of a perfect freedom from external control or interference—thus, we say, to fetter and enfeeble the representatives of the people, to take from them all dignity, all faculty of self movement, all real strength, would seem to be a singularly unreasonable political arrangement, viewed in whatsoever way it might, and is certainly one of the very last that ought to receive the admiration and patronage of any considerate friend of popular ascendancy.

The business of the people—their true interest as well as their duty—is to return to parliament only men in whose honesty, sound views, and ability they can place perfect confidence. The right of election, no doubt, is placed in their hands for the purpose of enabling them to impress what general tendency they may choose upon the course of the legislature and the government by the nomination of members holding the same sentiments with themselves. But if they ask for no more than this particular recommendation, they will make a very unwise choice. What object would any body of electors attain by returning as their representative a person who merely professed to be of their own way of thinking, if he was not also a person upon the honesty of whose professions they had sufficient ground for relying? or if, though sincere enough at the moment, he had so often and so lightly changed his opinions that there was good reason to apprehend he might some time soon do so again? or if, though neither to be suspected of duplicity nor of instability, he was so deficient in judgment and good sense as to be neither capable of advancing the credit and influence of any opinions he might hold, nor likely to conduct himself in his public character with ordinary discretion? A member of parliament ought, in all cases, to be a great deal more than merely a partisan of the same political creed with his constituents. That creed must be a very simple one if, in such a country as this, plenty of persons attached to it cannot be found who also possess the other qualifications fitting them to be returned to parliament. Is there any party among us ready to confess that it finds the political doctrines to which it is attached in this predicament? Let any one look around him, and does he not behold on all sides character, property, talent, knowledge, habits of business, public spirit, in an abundance probably never equalled in any other age or nation, and certainly, at all events, more than sufficient to supply with excellent members a dozen Houses of Commons? From this ample store of wealth and ability the people, if they really wish to be well served, will call to their service what is ablest and worthiest. The members of the House of Commons ought to be, in the highest sense of the word, the *elite* of the community—the picked men, as it were, of the popular force—the "excellence and flower" of whatever patriotism, cultivated intellect, aptitude for statesmanship, and public virtue or usefulness in any other form exists in those orders from which they are drawn. This capacity of constantly receiving fresh nourishment and regeneration from the richest qualities of the national mind is the great strength of an assembly so constituted; this, and not the manacling and weighing down of its members with conditions and authoritative instructions, is that which enables it to be more than a match for both royal prerogative and aristocratic privilege combined, and must eventually make it the controlling power in the state.

As for pledges exacted from candidates previous to their election, they certainly are not exposed to the same objection in point of principle that lies against mandates issued to members directing them how they are to vote after they have taken their seats. The exaction of pledges is not an interference on the part of the people with those duties which the constitution has assigned only to the members of the legislature; it is not an attempt to exercise any right which does not belong to them. In the mere choice of their representative they are entitled to the utmost freedom and latitude of judgment; they may determine not to return any other than a pledged member, just as they may determine, if so it should please them, not to return any other than a red-haired member, or a member six feet high. As with the assembled legislature, and with that alone, is lodged the power of making laws, so with the people alone is lodged the power of making the members who make the laws.

But in point of expediency the objections to the exaction of pledges from a candidate are, we think, so strong as to be quite decisive against the practice. It is no justification of it that it is an exercise of a right which does unquestionably belong to electors. It may be a very foolish exercise of a right. It is the right of the legislature to pass bad laws as well as good ones: but it is their duty for ever to pass only the latter. So in the part which the people have to perform, it is their right to return fools and knaves for their representatives if they choose; but nobody will say that they would exercise their right as they ought in so doing.

The object which a body of electors propose to themselves in demanding pledges from the person who wishes to become their representative is, of course, to lend the most effectual aid they can in the accomplishment of the measures which form the subjects of the pledges. Now, in the first place, if these measures really deserve to be carried, are they not certain, at any rate, to receive the support of a parliament composed as above described—of members selected not only because their sentiments are in harmony with those of their constituents, but because they are also the persons of greatest integrity, most penetrating sagacity, and most enlightened views to be found in the country? If the schemes in question do not commend themselves to the parliament in the same manner as they have done to the popular taste or judgment, the reason must be either that they do not deserve the approbation they have met with from the people, or that the parliament is not constituted as it ought to be. The proper preventive of the latter evil would have been a wiser choice of their representatives by the people. In that case the exaction of pledges would have been unnecessary. And the prevention of popular power which must be made use of to bind a representative by pledges would always suffice to return a good member instead of a bad one.

But it is not only that pledges are useless when a proper choice of members is made, and that they afford but a very slippery and insecure hold upon a member who is disposed to break away from them: for the law, of course, cannot enforce compliance with such engagements, and many instances testify how easy it is, whenever they are felt to be inconvenient, to find a plausible excuse for disregarding them. Such shackles are, besides all this, positive and most serious hindrances to right and effective legislation. The member who enters the House of Commons bound by a pledge to a particular line of conduct must be in various ways hampered and embarrassed by the obligation. His influence will be of necessity circumscribed by the taunts to which he will be exposed as having no right to vote except in one way on any thing, let his reason and conscience should impel him ever so strongly in another. And, indeed, it is difficult to see how he could well meet the objection that, committed as he was to a particular side of certain questions, he was no fit member of an assembly which professed, in regard to all questions that came before it, to deliberate ere it decided. It would not be enough that the pledge he had given to his constituents on the hustings should be admitted to have been perfectly conformable to his real opinions at the time: he was bound, it would be contended, however strong might have been his convictions, to keep his mind open to the operation of further discussion, and possibly additional information and more extended and matured views. As every honest and considerate man, nay, every man under no compulsion or inducement to act otherwise, evidently would prefer to hold himself thus far uncommitted, it would be said or insinuated that he had submitted to swallow the dose of degradation offered to him as the necessary act of subserviency by which his seat was to be purchased—that for that object he had basely sacrificed both his independence and his honour. Then, a member sitting with the halter of a pledge round his neck, will often find that, in the necessity of keeping to the letter of his vow, he is obliged to run the risk of flying in the face of its spirit and object. Let the proposition to the support of which he is bound be brought forward in any circumstances, however likely to ensure the humiliating defeat of the motion, and by any individual, however certain to injure rather than forward it by his advocacy—and he, too, in virtue of his unconditional compact, must throw himself into the vain and hopeless battle, and so far actually assist in exposing to discomfiture and shame the very cause he was specially commissioned to do his utmost to protect and advance. The discussion may have been forced on by an enemy of the measure in the

guise of an advocate, or with the view of impeding the progress of some other measure which both the pledged member and his constituents may deem of equal or still greater importance than the one thus interposed in its way; —no matter, the bondage to which he has bowed his back leaves him no alternative; he must still assist the trick with his vote, although mixed up, it may be, with the bitterest enemies, and deserted by every untrammelled friend, of his wonted politics.

CHANGES OF ADMINISTRATION AND HISTORY OF PARTIES. PART I.

At the present moment it may be interesting to review the fluctuations in the history of parties, as indicated by the successive changes that have taken place in the government since the settlement of the present constitution at the Revolution. In our present Number we shall only be able to carry forward such a retrospect as far as the accession of the House of Hanover: but this will conduct the history of the several great parties, springing out of the Revolution and the events that preceded it, from their origin up to the period when they may be considered as having attained full maturity and assumed each its distinct character and position. In subsequent papers the review will be continued to the present day.

1. Reign of William III. and Mary II. from 13th February, 1689, to 28th December, 1694, and thereafter of William III. to 8th March, 1702.

William, Prince of Orange, was called to the English throne by a coalition of all the parties in the state. With some comparatively unimportant differences as to the mode of procedure, the chief persons of all shades of opinion concurred in placing the government in his hands. Both in the convention, in point of fact, as appears by the votes of that assembly, and also, there is every reason to believe, in the nation generally, the two great parties of Whigs and Tories were pretty equally balanced. In these circumstances, as was naturally to be expected, the first ministry appointed by King William was of a somewhat mixed description. It contained, however, as Bishop Burnet observes, a majority of Whigs. The following were the principal members:—1. Lord President of the Council, Thomas Osborne, Earl of Danby (formerly Viscount Dunblane in Scotland, and Viscount Latimer in England, afterwards Marquess of Carmarthen and Duke of Leeds): this nobleman had held the office of Lord High Treasurer in the reign of Charles II. from 1673 till 1679, when he was impeached by the House of Commons on the charge that by various acts he had endeavoured to subvert the government and introduce arbitrary power. He escaped, first by the intervention of his royal master in dissolving the parliament (the second of the two known as the Long Parliaments), and afterwards by withdrawing from the country. But "he had," says Tindal, "by his accomplishing the king's marriage with the queen, and heartily concurring in the Revolution from the very beginning, atoned in some measure for his proceedings under Charles II." He now professed to side rather with the Whigs than the Tories. The movements, however, both of this statesman and of many others of those times, were generally actuated as much by personal considerations as by those of principle, and are scarcely to be reduced under any distinct party description. 2. Lord Privy Seal, George Saville, Marquess (formerly Viscount and Earl) of Halifax, characterized by Hume as "a fine genius, possessed of learning, eloquence, industry, but subject to inquietude, and fond of refinements." He had also been a minister, after the removal of Danby, under Charles II., having been one of the members of the new privy council of thirty nominated in 1679 on the recommendation of Sir William Temple. He had afterwards been Lord Privy Seal under the same king, and President of the Council under James II. In this last-mentioned reign he was considered the head of the small party known by the denomination of the *Trimmers*. "This man," says Hume in another place, "who possessed the finest genius and most extensive capacity of all employed in public affairs during the present reign (that of James II.), affected a species of neutrality betwixt the parties. This conduct, which is much more natural to men of integrity than of ambition, could not, however, procure him the former character; and he was always regarded as an intriguer rather than a patriot." Lord Halifax, at the period of the Revolution, Tindal tells us, "for zealously promoting all the steps that were lately made for the king was hated by the Tories, and for his opposition to the bill of exclusion was not beloved by the Whigs." 3 and 4. Principal Secretaries of State, Charles Talbot, Earl (afterwards Duke) of Shrewsbury, and Daniel Finch, Earl of Nottingham. Of all the ministers, Shrewsbury, says Tindal, "had the greatest share of the king's confidence. He had been educated a papist, but had renounced that religion upon a very critical and anxious inquiry into matters of controversy. He had no ordinary measure of learning, a correct judgment, with a sweetness of temper that charmed all who knew him. He had so great a command of himself, that during all the time he continued in the ministry, no person was heard to complain of him, except for his silent and reserved answers, with which his friends were not always well pleased." Shrewsbury, designated by Pope "the wise and great," may be considered as having belonged decidedly to the Whig party. The Earl of Nottingham (son of the late Lord Chancellor Finch), on the contrary, was one of the Tory leaders. "He had stood," says Tindal, "at a great distance from the court all King James's reign, and, though a privy councillor, never went to the board. When the Prince of Orange's coming over was proposed to him, he first agreed to it, but afterwards refused to proceed any farther. However, he afterwards declared that though his principles restrained him so that he could not go on, his affection would make him wish well to the cause, and he would be so far a criminal as concealment could make him. Accordingly he opposed the settlement with great earnestness; but always said that, though he would not make a king, yet upon his principles he could obey him when made better than those who were so much for making one." The employment of the Earl of Nottingham was not resolved upon till after considerable deliberation: but it was at last thought advisable, with the view of conciliating his large and powerful party. 5. First Lord of the Treasury, Charles Mordaunt, Viscount Mordaunt, (afterwards Earl of Monmouth, but better known by the title of Earl of Peterborough, which he inherited from his uncle). Lord Mordaunt was at the Hague when the invitations came over for the Prince of Orange, and "pushed on the enterprise," says Hume, "with that ardent and courageous spirit for which he was so eminent." Tindal's character of this remarkable personage, afterwards so distinguished in another sphere, is amusingly expressed. "He was a man," says that historian, "of much heat, many notions, and full of discourse. He was brave and generous, but had not true judgment; his thoughts were indigested and his secrets were soon known." 6. Chancellor of the Exchequer, Henry Booth, Baron Delamere (afterwards Earl of Warrington). This nobleman was also a staunch Whig, and had distinguished himself by his opposition to the court in the two preceding reigns. After James II. came to the throne he was tried on a charge of high treason, but acquitted. No Lord Chancellor was appointed for the present, the Great Seal being put in commission.

These persons, from the offices they held, must be considered as having been the chief responsible advisers of the crown; but it was not till a considerable time after this that the distinction between the members of the Cabinet and the other official personages was clearly established, or strictly attended to in practice. Even in modern times the composition of the cabinet, both in respect of the number of its members, and the departments of the government from which they are taken, is matter of temporary arrangement on every new construction of the ministry. Thus, while the Lord Chancellor, the Lord President of the Council, the First Lord of the Treasury, the Lord Privy Seal, the Chancellor of the Exchequer, the First Lord of the Admiralty, the three principal Secretaries of State, and the Chancellor of the Duchy of Lancaster are almost always cabinet ministers, there are a number of other offices, the holders of which sometimes have seats in the cabinet and sometimes not. Such are the offices of President of the Board of Control, President of the Board of Trade, Secretary at War, Paymaster-General, Postmaster-General, Master of the Mint, Chief Commissioner of Woods and Forests, Chief Secretary for Ireland, &c. In 1806, Lord Ellenborough sat in the cabinet while holding the office of Chief Justice of the King's Bench; and on the formation

of Lord Grey's ministry in 1830, the Earl of Carlisle was admitted to a place in the cabinet without holding any office. Formerly the policy of the government was far from being understood to be so exclusively regulated by the cabinet as it has now come to be considered. Even for some time after the Revolution the sovereign did not altogether cease to be his own prime minister. King William sometimes wrote both his messages and his speeches to parliament himself. And various great officers of the household, and even mere privy councillors, who held no office of any kind, were frequently more consulted by the crown than the ostensible ministers. Thus among King William's chief advisers during a considerable part of his reign were Charles Sackville, Earl of Dorset and Middlesex, Lord Chamberlain, William Cavendish, Earl (afterwards Duke) of Devonshire, Lord Steward of the Household, (he indeed retained that place till his death in 1707,) and William Russell, Earl (afterwards Duke) of Bedford, the father of Lord Russell, the distinguished victim of the reign of Charles II. To these may be added William Bentinck, who had been gentleman of the bedchamber to William when Prince of Orange, and who was now appointed Groom of the Stole and Privy Purse, and made an English peer by the title of Earl of Portland. The king's chief personal favour, Tindal says, lay between Bentinck and Mr. Sidney, brother to the Earl of Leicester and the celebrated Algernon Sidney, sacrificed at the same time with Lord Russell. Mr. Sidney (afterwards Viscount Sidney and Earl Romney) was in the first instance made one of the Gentlemen of the Bedchamber, but he subsequently occupied the Lord Lieutenancy of Ireland and other high situations. The celebrated John Churchill was also at this time made a Gentleman of the Bedchamber, and raised to the peerage by the title of Earl of Marlborough.

No complete change of ministry took place during the reign of William; but, in conformity with the policy which he had originally adopted, the king repeatedly made partial modifications in the cabinet, either with the view of effecting a more even balance of parties, or in accommodation to what appeared to be the prevailing humour of the parliament or the public. We shall note the more important of these changes.

A new parliament having been returned in the spring of 1690, and the elections having run to some extent in favour of the Tories, the king dismissed both Mordaunt and Warrington, and made such other changes as that, according to Tindal, "Whig and Tory were now pretty equally mixed." Sir John Lowther (afterwards Baron Lowther and Viscount Lonsdale), who, on his Majesty's first coming over, had been appointed Vice-Chamberlain of the Household and one of the Junior Lords of the Admiralty, was now made First Lord of the Treasury. This, however, was merely a temporary appointment, a new commission having been soon after made out, in which the name of Sir John Lowther was inserted as one of the Junior Commissioners, and that of Sidney Godolphin, Baron (afterwards Earl Godolphin), as the First Lord. Godolphin had been appointed to a seat at the Treasury Board when the king first came over, and had ever since enjoyed a large share of his Majesty's confidence. His being brought in gave great annoyance, Tindal tells us, to both Mordaunt and Warrington, hostile, as they were, to each other. "They soon saw," he says, "that the king considered him more than them both; for as he understood the Treasury business well, so his calm and cold way suited the king's temper." Godolphin, who had been brought up at court, had been one of the chief counsellors of Charles II., while the Earl of Sunderland was at the head of affairs; and he had also been Secretary of State for a short time in 1684, as well as one of the Lords of the Treasury in the reign of James II. Warrington's office of Chancellor of the Exchequer was filled by Richard Hampden, the great-grandson of the patriot.

Towards the end of this year farther changes were occasioned, first by the resignation of Halifax, and subsequently by that of Shrewsbury. The former, in consequence of some miscarriages in Irish affairs which were imputed to his mismanagement, became so unpopular with both the parliament and the nation, that he found it impossible to keep his ground. On leaving office he took his place in the ranks of the Tory opposition, with whom he ever afterwards continued to act. The Privy Seal, which he had held, was put, in the first instance, in commission, but was soon after given to Thomas Herbert, Earl of Pembroke, who had for some time previous held the office of First Lord of the Admiralty. The Earl of Shrewsbury resigned in disgust at the indifference which the king showed about the passing of the Abjuration Bill, or bill to compel all persons to abjure James II. on pain of imprisonment. Seeing his Majesty indisposed to press this measure through parliament, from a wish, as he conceived, to conciliate the Tories, he thought that he could not hold office longer to any good purpose. "He saw the Whigs," says Tindal, "by using his Majesty ill, were driving him into the hands of the Tories; and he thought that these would serve the king with more zeal if he left his post. Besides, the credit that the Marquis of Carmarthen gained was not easy to him." His place was given to Viscount Sidney. About this time also several decided Tories were sworn of the Privy Council, and admitted to a large share of the royal confidence—especially Jones, Earl of Ranelagh, who had been Paymaster of the Forces under James II., and Sir Edward Seymour, who had been Speaker of the House of Commons in the reign of Charles II. This latter person, who, although he had acquiesced in the Revolution, was all his life one of the most uncompromising adherents of the Tory party, was now made one of the Lords of the Treasury, and also admitted to a seat in the Cabinet.

In this state the principal appointments remained till the beginning of the year 1693. By this time the celebrated Robert Spencer, Earl of Sunderland, so long the minister of Charles II. and afterwards of James II., and notorious for his intriguing disposition, and what Hume calls "the extreme duplicity, at least variableness, of his conduct through the whole course of his life," had obtained as great an influence over the mind of King William as he had enjoyed over that of his first royal master. It is now well known, that, even while he held the office of President of the Council under King James, which he did up to the time of that unhappy prince's abdication, he was in communication with the Prince of Orange. On the Revolution he fled, in the first instance, to Holland, but soon returned to England. Here, when he had established himself in the favour of the new sovereign, he openly declared himself for the party of the Whigs: and chiefly by his influence and management, such modifications were now made in the ministry as gave that party the complete ascendency. The Great Seal was taken out of commission, and confided to the Attorney-General, Sir John Somers, first with the title of Lord Keeper, but a few years after with that of Lord Chancellor, and a peerage. This distinguished person, as everybody knows, had, from the first, been one of the most zealous and active supporters of the Revolution. At the same time, Viscount Sidney having, some time before, gone over to Ireland as Lord Lieutenant, Sir John Trenchard was made one of the Secretaries of State. He had been one of those who, in the former reign, were involved in the insurrection of the Duke of Monmouth, and he had on that account been obliged to fly beyond seas. "He was," says Tindal, "a calm and sedate man, and much more moderate than could have been expected, since he was a leading man in a party." The new character given to the administration was completed in the beginning of the following year by the dismissal of the Earl of Nottingham, who had become extremely unpopular owing to the recent ill success of the war with France, which was imputed to his incapacity or treachery, and by the recal of the Earl of Shrewsbury to fill his place. Sir Edward Seymour was now also removed from the Cabinet.

The ministry thus formed remained substantially the same for some years, the few changes that took place being chiefly in subordinate offices, or occasioned by the transference of the members of the cabinet from one office to another. In 1695, Charles Montague (afterwards Viscount and Earl of Halifax), an ardent Whig, was appointed Chancellor of the Exchequer. The same year Sir William Trumball was made Secretary of State on the death of Sir John Trenchard. Trumbull had lived mostly abroad for some years before the Revolution, but had not for all that been inactive in the cause of the liberties of his country. Pope has made him the subject of some very laudatory lines, in which he describes him as a politician—

> "Fixed to one side, but moderate to the rest;
> An honest courtier, yet a patriot too;
> Just to his prince, and to his country true."

He remained in office till December, 1697, when he was removed, and his place given to Mr. James Vernon, who had for a number of years before been chief clerk to the Duke of Shrewsbury. In the course of the last-mentioned year, Sunderland, who for some years had been really Prime Minister, although without any office, was appointed to the place of Lord Chamberlain on the resignation of the Earl of Dorset, whose declining health unfitted him for longer employment. Sunderland held his office, however, only for a few months. He was so pressed upon both by the open hostility of the Tories, and the jealousy of his new associates the Whigs, that, apprehending he would be overthrown whenever an attack should be made upon him, through the violence of the former, and the feeble and reluctant defence he might expect from the latter, he resigned, "not only," says Tindal, "against the entreaties of his friends, but even the king's earnest desire that he would continue about him."

On the 14th of May, 1699, the ministry was extensively remodelled by the following alterations and new appointments. The public credit of the Duke of Leeds having been severely damaged by charges of bribery which had been made against him in parliament, although the protection of the court had screened him from impeachment, he was removed from the Presidency of the Council, and the Earl of Pembroke substituted in his room, the Privy Seal being given to Lord Lonsdale. At the same time another new member, Edward Villiers, Earl of Jersey, was admitted into the ministry, being appointed one of the Secretaries of State in the room of the Duke of Shrewsbury, who had been rendered incapable of undergoing the fatigues of business by a fall from his horse. Lord Jersey soon showed himself a zealous partizan of the Tories. Before the end of the same year, Ford Grey, Earl of Tankerville (formerly Lord Grey of Werk), was appointed First Lord of the Treasury, in the room of Mr. Montague, who was transferred to the Auditorship of the Exchequer. Montague's other office of Chancellor of the Exchequer was given to John Smith, Esq., who had had a seat at the Treasury Board for the preceding four or five years, Tankerville was a Tory, Smith a Whig.

Notwithstanding these changes, however, the Whig influence might still be considered as predominating in the government, the two persons by whom affairs were chiefly conducted continuing to be Lord Somers in the House of Lords, and Mr. Montague in the Commons. But things were nevertheless fast tending to a change. The session of parliament which commenced in November, 1699, was by far the most stormy that had been known since the Revolution. Although the two great parties were pretty equally balanced in the House of Commons, or, rather, although the Whigs were in general able to beat their opponents by a small majority on the vote, the Tories, by the formidable force they could muster, still had it in their power materially to impede the progress of public business, and upon this vexatious course of procedure they placed their reliance, as the means of eventually compelling the king to part with his present counsellors. Their chief efforts, in the first instance, were directed to effect the removal of the great stay of the government, the Lord Chancellor Somers; and here they were so successful, that, tired of the contest, his Majesty, in April, 1700, after having in vain endeavoured to persuade the Chancellor to resign, sent an order to him by Lord Jersey to deliver up the seals. They were soon after given, with the title of Lord Keeper, to Sir Nathan Wright, a Tory lawyer, "in whom," says Tindal, "there was nothing equal to the post, much less to him who had lately filled it." "The state of things at that time," says the same historian, "gave a melancholy prospect. The nation was falling under a general discontent, and a dislike of the king's government; and the king, on his part, seemed to grow weary of them and their affairs. The House of Commons, how much soever its power was advanced, yet was much sunk in its credit; very little of gravity, order, or common decency appeared among them. The balance lay chiefly in the House of Lords, who had no natural strength to resist the Commons." The Tories, in the mean time, severed in pushing their advantages. "This party," says Tindal, "had continued, from the king's first accession to the throne, in a constant opposition to his interests. They had been backward in everything that was necessary for carrying on the former war; they had opposed taxes as much as they could, and were against all such as were easily levied, and less sensibly felt by the people; and were always for those that were most grievous to the nation, hoping that by these heavy burthens the people would grow weary of the war and of the government. On the contrary, the Whigs, by supporting both, were become less acceptable to the nation. In elections their interest was much sunk. Every new parliament was a new discovery that they were become less popular; and the others, who were always opposing and disclaiming, were now cried up as the patriots. In the three last sessions, the Whigs had shown such a readiness to give the king more force, together with a management to preserve the grants in Ireland, that they were publicly charged as betrayers of their country, as men who were for trusting the king with an army. In short, they were accused of too ready a compliance with the humours and interests of courts and favourites, and were therefore generally censured and decried. And now, since they had not succeeded to the king's mind, some about him possessed him with this, that either they would not, or could not, serve him." In this state of things it is understood that, before setting out for Holland in July, his Majesty had come under engagements to the Tory leaders to make further changes in the government in favour of their party. Very soon after, accordingly, Lawrence Hyde, Earl of Rochester (formerly Lord Hyde), second son of the great Earl of Clarendon, who had held in succession the offices of Chancellor of the Exchequer, First Lord of the Treasury, Lord President of the Council, Lord Lieutenant of Ireland, and Lord Treasurer, in the two preceding reigns, and who, although made a Privy Councillor by king William a few years after the Revolution, had never entirely relaxed his attachment to his original high prerogative principles, was employed to enter into negotiations with his party with the view of bringing them into power. Lord Lonsdale being dead, the Earl of Tankerville was now appointed Lord Privy Seal, and Lord Godolphin was brought in to succeed him as First Lord of the Treasury. At the same time the Earl of Jersey was made Lord Chamberlain, and his place of Secretary of State given to Sir Charles Hedges, one of the Judges of the Admiralty. Rochester himself was replaced in his old post of Lord Lieutenant of Ireland. But the severest blow which was dealt to the Whig interest was the removal, from the House of Commons, of Mr. Montague, who was raised to the peerage by the title of Baron Halifax. These arrangements being made, the new ministry determined to try if they could not gain an accession of strength from the chances of a general election, and the parliament was forthwith dissolved.

The result was such as fully to answer the expectations with which the scheme had been tried. In the new House of Commons, which met in February, 1701, there was a majority of nearly two to one on the side of the Tories. This was shown on the first day of the session, when the able and active Tory partizan, Robert Harley, Esq. (afterwards Earl of Oxford), was elected Speaker by a majority of 249 to 125. The confidence inspired by this great apparent strength, however, nearly proved the overthrow of the party which had thus suddenly obtained an ascendency. Their proceedings immediately came to be characterized by such violence as to disgust both the king and the nation. The new ministers, not satisfied with having obtained the dismissal of their predecessors from office, got the House of Commons first to address the king to remove them from his councils and presence for ever, and afterwards to vote articles of impeachment against them. In pursuing this headlong course, the Commons soon added to the other difficulties of their position by getting involved in a contest with the House of Lords. In this state of things the king determined again to dissolve the parliament. The new returns showed the change that in a few months had taken place in the public mind. Although many Tories were sent up from the smaller boroughs, most of the counties and great towns chose Whig members. The parliament met on the 30th December, when Mr. Harley was again elected their Speaker by the Commons, but this time only by fourteen votes more than were obtained by his opponent; and on all ordinary questions it soon appeared that the advocates of a moderate line of policy might count upon a sure majority.

The following alterations were now made in the ministry.

On the 27th of December, Charles Howard, Earl of Carlisle, was substituted for Lord Godolphin as First Lord of the Treasury. Some months before, the Hon. Henry Boyle (afterwards Earl of Carleton), who had for some years had a seat at the Treasury Board, had been made Chancellor of the Exchequer in the room of Mr. Smith. On the 4th of January, 1702, Charles Montague, Earl of Manchester, was made Secretary of State in the room of Sir Charles Hedges; and on the 18th of the same month, the Earl of Pembroke having been transferred from the Presidency of the Council, and made Lord High Admiral, Charles Seymour, Duke of Somerset, was appointed to succeed him in the former office. Some months before, also, on the decease of the Earl of Tankerville, the Privy Seal, which he had held, was put in commission. The new members thus taken into the cabinet were principally the personal friends of the king. These appointments were the last made by King William.

2. Reign of Queen Anne, from 8th of March, 1702, to 1st of August, 1714.

The accession of Queen Anne was immediately followed by the appointment of a new ministry, composed almost exclusively of members of the Tory party. To this party she had always been attached: even the influence of the famous Sarah, Countess (afterwards Duchess) of Marlborough, who was appointed Groom of the Stole and Privy Purse, was exerted in vain to moderate her prejudices upon this head. Indeed, "the Lords Marlborough and Godolphin themselves," says Tindal, "would not have had so great a share of her favour and confidence, if they had not been reckoned in the number of Tories. The truth is, both these Lords had been educated in the persuasion that the Tory party were the best friends to the Constitution, both of Church and State; nor were they perfectly undeceived but by experience."

Marlborough himself having been appointed Captain General of the Forces, both in England and abroad, Godolphin, who was his intimate friend and connexion, was declared Lord High Treasurer. The office of Lord High Admiral was conferred on Prince George of Denmark (the Queen's husband) assisted by a council of his own appointment. The Earl of Nottingham and Sir Charles Hedges became again the two Secretaries of State. John Sheffield, Marquis of Normanby (afterwards Duke of Normanby and Buckingham) had the Privy Seal; and Sir John Leveson Gower (afterwards Lord Gower) the Chancellorship of the Duchy of Lancaster. The Earl of Rochester was continued in the Lord Lieutenancy of Ireland, from which King William had been about to recall him. The Earl of Jersey, Sir Edward Seymour, the Earl of Abingdon, Lord Dartmouth, and various other decided Tories, were appointed to places in the household, or sworn in of the Privy Council. "It was generally believed," says Tindal, "that the Earl of Rochester and his party were for severe methods, and for a more entire change through all subaltern employments; but the Lord Godolphin and the Earl of Marlborough were for more moderate proceedings; so that though no Whigs were put into any posts, yet many were kept in those which they had enjoyed during the former reign." The influence of Rochester, notwithstanding his near relationship to the Queen (whose uncle he was), was soon after found, on the question of the war with France (which he opposed) to be inferior in the council to that of Marlborough and Godolphin; and upon this discovery he retired from court. In the following July, among some minor appointments, the Earl of Pembroke was made President of the Council, and the Duke of Somerset Master of the Horse in his room. The Duke of Devonshire had been continued in his office of Lord Steward of the Household, and as one of the advisers of the Crown.

The new parliament, which met on the 20th of October, turned out of the same complexion with the ministry. "Her Majesty," says Tindal, "did not openly interpose in the elections, though, her inclination to the Tories plainly appearing, all people took it for granted that she wished they might be the majority. This wrought on the inconstancy and servility that is natural to multitudes; and the conceit which had been infused and propagated with much industry, that the Whigs had charged the nation with great taxes, of which a large share had been devoured by themselves, had so far turned the tide, that the Tories in the House of Commons were at least double the number of the Whigs." The Commons again chose Harley their Speaker.

The first change of importance which the ministry underwent took place in April, 1704, when the Earl of Nottingham, leaving, at the instigation of his party, the ultra Tories, endeavoured, without success, to induce the Queen to remove from the cabinet the Dukes of Somerset and Devonshire, threw up his office of Secretary of State. Upon this, Harley, the Speaker of the House of Commons, was appointed to the vacant office. At the same time Henry de Grey, Earl (afterwards Duke) of Kent, was substituted for the Earl of Jersey as Lord Chamberlain; and Sir Thomas Mansel (afterwards Lord Mansel) for Sir Edward Seymour, as Comptroller of the Household. The celebrated Henry St. John (afterwards Lord Bolingbroke) was now also brought in as Secretary at War. These new nominations, however, though they somewhat liberalized, did not essentially alter the character of the administration.

The Parliament, however, under the Triennial Act, being now near the term of its existence, was dissolved in April, 1705, and a new one summoned, which met in October following. The elections this time having run greatly more in favour of the Whigs than on the last occasion, the more liberal portion of the ministry acquired a considerable accession of influence. Godolphin, in particular, now began openly to declare for the Whigs. This state of things led, in the course of this and the following year, to various changes, of which the following were the two most important. Immediately before the meeting of Parliament the Lord Keeper, Sir Nathan Wright, was dismissed, and the eminent Whig lawyer, William Cowper, Esquire, appointed in his place. The Keeper was the following year made Lord Chancellor, and a peer, by the title of Lord Cowper. And in December, 1705, another Whig of distinguished ability, Charles Earl of Sunderland, the son of the minister of the late king, was appointed to the post of Secretary of State in the room of Sir Charles Hedges. The change in the character of the ministry was completed in the beginning of the year 1708, by the removal of Secretary Harley, who had for some time past been the almost openly declared competitor for the ascendancy in the Cabinet with the Lord Treasurer. While Godolphin and Sunderland were supported by the Duchess of Marlborough, Harley depended upon the good offices of her Grace's relation and rival in the favour of their royal mistress, Mrs. Abigail Masham (afterwards Lady Masham). For the present, however, the temper of the House of Commons, together with the suspicion and public outcry occasioned by the conviction of a person named Gregg, who had been a clerk in Harley's office, on the charge of having conveyed intelligence of certain State secrets to the Court of France, —although there certainly was no proof that Harley had had anything to do with the act of treason—decided the contest in favour of the Treasurer. Godolphin and Marlborough having declared to the Queen that if Harley was not dismissed they would leave her service, and there being reason to believe that the majority of their colleagues were prepared to follow the same course, her Majesty was with great reluctance compelled to insist upon the Secretary's retirement. He was succeeded by Boyle, the Chancellor of the Exchequer. St. John and Mansel, and Sir Simon Harcourt (afterwards Lord Harcourt,) the Attorney-General, also retired on this occasion. St. John's place was given to the afterwards celebrated Robert Walpole, who had already greatly distinguished himself in the House of Commons. Before the end of the year the Earl of Pembroke was, on the death of the Prince of Denmark, advanced to the post of Lord High Admiral: and the two offices which he had previously held, of Lord President of the Council, and Lord Lieutenant of Ireland, were given, the former to Lord Somers, and the latter to Thomas Wharton, Earl (afterwards Marquis) of Wharton. Lord Wharton, who was a zealous Whig, took over with him the celebrated Mr. Addison as his secretary.

The ministry thus settled continued in power till the summer of 1710. The proceedings of the House of Commons, and the violence displayed by the Whig majority in the beginning of that year, in the famous affair of Dr. Sacheverel, had occasioned throughout the country an extraordinary ferment in the popular mind, and a strong re-action against the ministers, who in their treatment of the Doctor were conceived to have shown themselves the enemies of

once of the church and of the monarchy. Meanwhile, also, the persevering intrigues of Mrs. Masham had at length evidently succeeded in prejudicing the Queen both against the Duke and Duchess of Marlborough, and the ministers in general. The first indication of the design that was in preparation was given by the appointment, about the middle of April, of the Duke of Shrewsbury to the office of Lord Chamberlain, in place of the Marquis of Kent. Shrewsbury had recently returned from Italy, where he had resided since the death of King William; but having married a Roman lady, who had once at least been a Catholic, and having also voted for the acquittal of Sacheverel, he was scarcely now considered as belonging to the Whig party. His present appointment, which was made in direct opposition to the remonstrance of Godolphin, was supposed to have been the result of a secret understanding into which he had entered with Harley. Two months after, the Earl of Sunderland was dismissed, and his place of secretary given to Lord Dartmouth, the son-in-law of the Earl of Nottingham. On the 8th of August Godolphin himself received his dismissal—according to one account the letter commanding his lordship to break his staff being sent to him by a servant in livery. The next day it was announced that Harley had been appointed Chancellor of the Exchequer, and Earl Poulett First Lord of the Treasury, Sir Thomas Mansel and other Tories being associated with him in the commission. In the following month the Earl of Rochester was appointed President of the Council in the room of Lord Somers; the staff of the Lord Steward was taken from the Duke of Devonshire and given to the Duke of Buckingham; Secretary Boyle was removed and St. John put in his place; Lord Berkeley was made Chancellor of the Duchy of Lancaster instead of the Earl of Derby; and, finally, the Great Seal was taken from Lord Cowper, and after having been in the first instance put in commission, was given to Sir Simon Harcourt with the title of Lord Keeper, which he afterwards exchanged for that of Lord Chancellor and a peerage. The Parliament, which had been prorogued a few days before the appointment of the Duke of Shrewsbury, was then declared to be dissolved, and a new one called. Among the minor appointments made before it met, may be mentioned those of Matthew Prior, the poet, and George Granville, (afterwards Viscount Lansdowne,) also one of the most distinguished literary characters of the day. Prior, who had some years before deserted his original friends the Whigs, by whom he had been first introduced to public life, and joined the party of their opponents, was made one of the Commissioners of Trade and Plantations: and Granville succeeded Walpole as Secretary at War. Lord Wharton was also recalled from Ireland, and James Butler, Duke of Ormond, (the same who had been the patron of Dryden, and to whom the poet dedicates his Fables,) was replaced in the office of Lord Lieutenant, which he had occupied before in the commencement of the present reign. Lord Wharton's recall of course also brought home his secretary, Mr. Addison; and to this release we probably owe many of the best papers in the Spectator and Guardian.

The result of the elections was favourable beyond even the most sanguine expectations of the new ministry. "By the first returns," says Tindal, it "appeared that amongst the new members the number of the Whigs was near equal with that of the Tories, which, as was then given out, answered the expectation and desires of the new managers. For, having gained their chief aim, which was to remove the late Lord Treasurer and his friends, it was by many believed that they designed to carry things even between both parties; and therefore wished only for such a majority of the High Church in the House of Commons, as might countenance the new scheme; and whom, on the other hand, they might easily check by means of their own creatures, if an unseasonable zeal for the Church should prompt them to make any motions against the toleration. If this was the real intention of the new ministry, or of Mr. Harley in particular, the chief author of the late changes, it soon appeared that they were either mistaken in their computation, or disappointed in their wishes, and that the new members of the High Church party far outnumbered those of the contrary side." In fact, although in Scotland the elections ran pretty equally between the two parties, there were only about a hundred Whigs in all returned for England. The Parliament met on the 25th of November, when Mr. Bromley, member for the University of Oxford, and a decided High Churchman, as may be supposed, was elected Speaker by acclamation.

Thus supported, the Queen and her new ministers went to work with a high hand. The Duchess of Marlborough having surrendered all her places, the Duchess of Somerset was appointed to succeed her as Groom of the Stole and Mistress of the Robes, while Mrs. Masham got the Privy Purse. In the beginning of May the sudden death of the Earl of Rochester removed Harley's most formidable rival in the royal favour. He was immediately after created Earl of Oxford and Earl Mortimer, made a Knight of the Garter, and appointed Lord High Treasurer, the office of Chancellor of the Exchequer being given to Robert Benson, Esq. (afterwards Lord Bingley). Earl Poulett, who had been First Lord of the Treasury, was now made Steward of the Household, and the Presidency of the Council was conferred upon the Duke of Buckingham. Soon after, the Duke of Newcastle having died in consequence of a fall from his horse, his office of Lord Privy Seal was conferred upon the Earl of Jersey; but that nobleman having also died on the very day he received this appointment, the place was eventually bestowed upon Dr. Robinson, Bishop of Bristol (afterwards of London). The ministers who composed the cabinet after these changes had been completed, were the Earl of Oxford, the Duke of Buckingham, the Bishop of Bristol, the Duke of Shrewsbury, Earl Poulett, the Earl of Dartmouth, and Mr. Secretary St. John.

Meanwhile, the Tory majority of the House of Commons, eager to add the sweets of vengeance to those of victory, were pursuing various members of the late administration in a succession of votes of inquiry and denouncement. One of the first objects of their attack was the late Lord Treasurer Godolphin; but against that nobleman it was soon found that no plausible charge could be established. Walpole, the late Secretary at War, was less fortunate. On an accusation, very unsatisfactorily supported, that he had shared in the profits of a contract for the supply of forage to some cavalry stationed in Scotland, he was expelled the house and committed to the Tower. On the same day (the 30th of December) the Duke of Marlborough was deprived of all his employments, and soon after proceedings were commenced against him also on a charge of misapplication of the public money. On the day following, by an unprecedented exercise of the prerogative, twelve new peers, the friends of the ministry, were suddenly called up by writ at the same time to the House of Lords.

In the new arrangements made necessary by the removal of the Duke of Marlborough, the Duke of Ormond was made Commander in Chief of all the Queen's land forces both at home and abroad; Richard Savage, Earl Rivers, was made Master General of the Ordnance; Henry Somerset, Duke of Beaufort, Captain of the Band of Pensioners; and Brigadier Hill, brother of Mrs. Masham, Lieutenant of the Tower. In the course of the month of January, also, the Duke of Somerset, the moderation of whose politics was considered to make his presence at court inconvenient, was removed from his office of Master of the Horse; but the Duchess, although she also offered to resign, was continued in her places of Groom of the Stole and first Lady of the Bedchamber.

After this no further alterations of importance were made for some time. On the 5th of May, 1713, the peace concluded at Utrecht was proclaimed amidst the general rejoicings of the public, wearied of twelve years of the costly game of war. On the 8th of August the parliament, to whose temper unquestionably the nation had been mainly indebted for this blessing, and which has been therefore sometimes called the pacific parliament (Bishop Burnet says it was the worst he ever saw), was dissolved, after it had sat for nearly its full term of three years.

The new House of Commons, although, according to Tindal, "a far greater number of Whigs were chosen than was by many expected," was still decidedly Tory and ministerial. The relative strength of the two parties may be inferred from the vote which was come to on the 18th of March, on the proposal to expel Mr. Steele, which was carried by a majority of 245 against 152. The existing ministry therefore would certainly not yet have been driven from power by the want of parliamentary support. But even before the old parliament had been dissolved, a rivalry, which had for some time been maturing, between Harley and St. John (now Viscount Bolingbroke) began to show

itself in an almost open struggle for ascendancy. At first, the established influence of the Lord Treasurer succeeded in carrying the day. Bolingbroke's scheme, it is supposed, was to place himself and the Chancellor Harcourt at the head of a party consisting of the Ultra-Tories, the almost avowed enemies of the Hanoverian succession. Instead of this project taking effect, however, the Treasurer, immediately after the dissolution, succeeded in strengthening his position for the present by the following among other new appointments. The Duke of Shrewsbury was made Lord Lieutenant of Ireland; Bromley, the Speaker, Secretary of State; the Earl of Mar, Secretary of State for Scotland; Sir William Wyndham, Chancellor of the Exchequer, in the room of Benson, created a peer and sent as ambassador to Madrid; and Francis Gwyn, Esq., Secretary at War, in the room of Sir W. Wyndham.

Although defeated for the present, however, Bolingbroke employed his time so well that it was not many months before he had contrived to gain the advantage over his rival, both in the royal favour and in the cabinet. The quarrel between the two became an open rupture immediately after the termination of the first session of parliament, on the 9th of July, 1714; and on the 27th of the same month Lord Oxford received his dismissal. "It was said," Tindal writes, "that to soften his fall the Queen designed to bestow on him an annual pension of 5000*l.* for life, with the title of Duke of Newcastle; and upon his recommendation, to give the title of Earl of Clare to the Lord Pelham; but, contrary to his own, and indeed the general expectation, when he went to court on the 27th of July, the staff was taken from him, rather with mortifying than agreeable circumstances. It is certain that severe reproaches passed, in the Queen's hearing, between the falling minister and the Lord Chancellor, and the lady Masham, whom the Treasurer had disobliged some days before, by making a demur to a grant she had obtained of 15,000*l.* a year, and whom he looked upon as accessory to his disgrace." The Queen by this time was on her death-bed, the fatal progress of her illness having been accelerated, as she is said to have herself asserted, by these distractions among her ministers. The immediate prospect of a new reign, therefore, still farther complicated the calculations of the several contending parties in the state. Bolingbroke and his associates, there can be no doubt, would have at once avowed themselves in the interest of the Pretender, if they had seen any probability of being able to prevent the succession of the Elector of Hanover. In the circumstances, however, there is reason to believe that this aspiring and unscrupulous politician was preparing to make overtures to his old enemies, the Whigs, with the view of sustaining himself in power by their alliance. "It appeared plainly, however, soon after," says Tindal, "that whatever were the Lord Bolingbroke's thoughts and views at this time, the main design of the Whigs was to inflame the animosity between him and the Earl of Oxford, as the readiest way to ruin them both."

A strange scene now took place. On the morning of Friday, the 30th of July, the Dukes of Somerset and Argyle, having heard that the Queen was dying, took the bold resolution of repairing to Kensington Palace, where she was, and without being summoned, presenting themselves in the Council Chamber. Here they found the Lord Chancellor, the Dukes of Shrewsbury and Ormond, Bolingbroke, Bromley, and the Earl of Mar, (the three Secretaries of State,) the Bishop of London, and some others, in committee. The surprise manifested by some of these persons at the intrusion of the two Dukes was immediately met by an explanation on the part of the latter, of the reasons which had induced them to take the step they had done; on which the Duke of Shrewsbury returned them thanks for their readiness to give the Council their assistance in so critical a juncture, and they took their places at the board. It was then proposed that the physicians should be called in and examined, with the view of ascertaining if the Queen was still sufficiently sensible to nominate some person to fill the vacant post of Lord Treasurer; and their answers upon this head being satisfactory, the Chancellor and other members of the cabinet were ordered to attend her Majesty, and to lay before her the unanimous opinion of the Council that the office ought to be given to the Duke of Shrewsbury. Upon this she replied, that they could not have recommended a person she liked better than the Duke of Shrewsbury; and delivering the Treasurer's staff into his Grace's hands, she desired him to use it for the good of her people. This was the last appointment made by Queen Anne. She survived only till the morning of the following Sunday, the 1st of August. When she had given the Duke of Shrewsbury the staff of Lord High Treasurer, his Grace offered to return the Lord Chamberlain's staff, "but she desired," says Tindal, "he should keep them both; so the same person was at once possessed of three of the highest places of trust, honour, and profit, under the Crown of Great Britain, being Lord Treasurer, Lord Chamberlain, and Lord Lieutenant of Ireland. The Duke's advancement to the post of Lord Treasurer, immediately changed the face of affairs, baffled Lord Bolingbroke's scheme, alarmed the friends of the Pretender, and revived the spirits of the well-affected to the Hanover succession."

[To be continued in next Number.]

REPORT FROM THE SELECT COMMITTEE OF THE HOUSE OF COMMONS ON ELECTION EXPENSES.

On the 11th of February last, a very few days after the commencement of the Session of Parliament, a Select Committee of the House of Commons was appointed "to inquire into the expenses charged by the returning officers at the election of members for counties and boroughs in England and Wales, Scotland and Ireland, at the last general election; and also to inquire into all other expenses attendant on the registration of votes, and at the election, with the view of fixing one uniform rate of charge." To this committee were afterwards referred various returns made to the House of Commons of the number of electors entitled to vote at the last general election, with power to report their observations thereon; and the committee having met from time to time, for the purpose of examining witnesses, and having called for a variety of returns bearing upon the questions referred for their examination, a report was presented to the House on the eve of its prorogation, and has only very recently been distributed to the members.

The second branch of the inquiry—that relating to the number of electors—being the most interesting and important part of the inquiry, especially at the present moment, we shall follow the example of the committee in their report, and direct to it the greater part of our attention. It is much to be regretted that in consequence of some persons who were required to make returns to the committee, having mistaken the objects of the order sent to them, a part of the returns are incorrect to a degree which makes it impossible for us to draw from them any precise or useful conclusions. In the statements which we shall now proceed to give, we shall endeavour to make the best use we can of those parts of the materials furnished which appear to be free from the objection just stated, and shall avoid those statements which are incomplete, or which bear the marks of incorrectness.

One of the strongest objections which has been, and which still continues to be brought forward against the qualification principle adopted by the Reform Bill, is founded on the assumption that it gives too great a preponderance to the inhabitants of populous towns and boroughs, in which, from the nature of the qualification fixed on by the legislature, the elective franchise is enjoyed by a class of persons lower in their station, and therefore less fitted for its exercise than those by whom it is possessed in other districts. The validity of such an objection, if even it were founded on fact, would meet with many opponents, who are of opinion that the qualification now fixed is not by any means fitly adapted to the great and growing intelligence of a very numerous body of men in these kingdoms, who are thereby excluded from exercising any voice in the choice of representatives. The returns given in the Appendix to this Report show, however, how unfounded in fact is the position taken up by the objectors. We pass over the statements given relative to the constituencies of counties, as having nothing to do with this question, and also because we believe the various qualifications adopted in the case of counties are altogether satisfactory to the opponents of the borough qualification.

Of the 500 members returned to Parliament by the 52 counties, and 199 represented cities, towns, and boroughs in England and Wales, 159 members are returned by the

counties and 341 by the towns. This division would, at the first glance, appear to give a decided majority of more than two to one in favour of the inhabitants of towns; but a very slight examination of the returns given in this Report enables us to see the fallacy of this apparent inequality.

It is notorious that a large proportion of the towns and boroughs in the kingdom have an entire community of interest with the constituencies of the counties in which they are situated, and that the members of their choice are as much the representatives of what is called "the landed interest" as the knights of the shires. This fact applies more particularly to boroughs with small constituencies, where, from various local circumstances, the influence of the great landed proprietors is even greater than it is in the divisions of counties.

According to calculations which we have made, founded on the abstract given in pp. 188 to 191 of the Appendix to the Report, it appears that 170 members for boroughs, being just one half of those returned in England and Wales, are elected by 49,153 persons, being on the average 1 member for every 289 electors.

Of these, 32 places whose constituencies do not exceed 300, return 44 membs.

23 places where the number of electors is between	300 and 400,	,, 34	,,
20 places where the electors are between 400 & 500,		,, 31	,,
13 ,, ,,	500 and 600,	,, 21	,,
16 ,, ,,	600 and 700,	,, 24	,,
10 ,, ,,	700 and 800,	,, 16	,,
114		170	

The borough included in the above statement, which has the smallest number of registered votes, is Thetford in the county of Norfolk. In that place 146 electors return 2 members. There are only four other boroughs, the numbers of whose electors are under 200. These are Ashburton with 198, Riegate with 152, Calne with 191, and Westbury with 185 electors. These places return only one member each.

It can hardly be thought that the system of representation has been rendered too popular, when it is thus shown that 170 members—being more than one-fourth of the total number of representatives for the United Kingdom—are returned by 49,153 electors, a number forming no more than the 118th part of the males above twenty years of age. At the same time that must be admitted to be a great improvement, which has transferred even to this comparatively small proportion of the people, a franchise which was previously exercised by a very few individuals, belonging chiefly to the aristocracy.

The objection which we have stated is principally pointed at the newly enfranchised boroughs in England and Wales, 42 in number, and which contain a gross population of 2,436,716 souls; but even in these cases it will be found that the 64 members which they return are sent to Parliament by only 81,991 electors, being at the rate of one member for every 1281 electors, while the 500 members returned for the whole of England and Wales are sent by 656,337 electors, which is at the rate of 1 member for 1313 electors. This is as near as possible to the general average for the whole of England and Wales; but if we examine these numbers according to the total population, we shall find that while the 500 members represent 13,897,187 inhabitants, or 1 member for 27,794 individuals, the 64 members sent by the new boroughs represent 2,436,716 inhabitants, or only 1 member for 38,073 individuals. If further examined by the test of property adopted in the Reform Act, we shall find that 341 members are returned by places having 427,760 houses of 10*l.* and upwards, annual value, or 1 member for 1254 houses, while the 64 members are returned by new boroughs which have 222,218 houses of the requisite annual value, or only 1 member for 3472 houses.

Our space will not admit of extending this examination to Scotland and Ireland, and we must close this part of the subject by calling attention to the following tables, in elucidation and proof of the correctness of our statements.

The following summary shows the population of Great Britain and Ireland from the returns of 1831; the number of counties, ridings, parts or divisions, cities and boroughs, returning members to serve in parliament, taken from the Boundary Reports; the number of members returned for each division of the kingdom; the number of electors enrolled previous to the general election in 1832, and the proportions they bear to the population; the number and proportion which the electors bear to the males of 20 years of age, and the proportion the representatives bear to the gross population and to the electors respectively; together with the number of houses worth 10*l.* a year and upwards, or assessed at 10*l.* a year and upwards, in the cities and boroughs of Great Britain.

	Number of Counties.	Population of Counties, Ridings, and Baroughs, exclusive of the Boroughs, Population.	Number of Representatives of Cities, Towns, and Boroughs, &c.	Population of the Cities, Towns, and Boroughs, in 1831.	Total of Population of Great Britain and Ireland in 1831.	Number of Representatives. For Counties.	Number of Representatives. For Boroughs, &c.	Number of Electors enrolled previous to General Election in 1832. In Counties.	Number of Electors enrolled previous to General Election in 1832. In Boroughs, &c.	Total Number of Electors in Counties, Boroughs, &c.	Proportion of Electors in County Population.	Proportion of Electors in City, Borough, &c. Population.	Number of Males in Counties and Boroughs of 20 years of age and upwards.	Proportion of Electors to Male Population of 20 years of age and upwards.	Number of Electors in every 100 of the gross Population.	Per Cent.	Number of Electors in every 100 Males of 20 years of age and upwards.	Per Cent.	Number of Inhabitants to one Representative.	Average Number of Electors who return one Representative.	Number of Houses in Boroughs, &c., worth 10*l.* a year and upwards, or assessed at 10*l.* a year and upwards.

One part of the Reform Act, which all parties are agreed in commending, is that which regulates the duration of the elections. In every case the polling is limited to two days, seven hours being allowed on the first, and eight hours on the second day. This regulation is found to lessen the expenses of the candidates, and what is at least of equal importance, it has in a great degree put an end to the shameless bribery which was formerly practised at contested elections, where venal voters kept back from the poll until near the time of its closing, in order to make the best market of their suffrages. This disgraceful practice, although greatly limited at present, is not wholly prevented; and one of the strongest recommendations offered to Parliament by the committee in its Report is, that means should be taken to limit the duration of the election to one day, in boroughs and cities, and possibly also in counties. On this subject the committee states:—

"Your committee, having well considered the evidence they have received, the returns of the number of voters polled on the first and second days of the election, and all the advantages to be derived from shortening the time, are unanimous as to the facility of reducing the time of polling, at borough elections, to one day; but there is some difference of opinion respecting its practicability at county elections. The majority, however, think that the election might also be made in counties, with perfect safety to the suffrage of the electors, in eight or nine hours, if the preparatory measures recommended by your committee should be adopted.

"It is well known that the time most favourable for bribery and corruption at contested elections is in the night between the first and second day's poll; and there are many electors who have regularly refused to vote on the first day, that they might be able, when the contest runs near, to make their own terms for the second day. Your committee, therefore, are of opinion that if there were no other advantage than the putting an end to such corrupt practices, an effort should be made to stop them; but they consider that the freeing the towns and counties from the excitement of a second day's poll, the saving of time, the lessening of expense to the candidates, and to all parties concerned, are also objects well deserving the attention of Parliament."

At the general election in 1832, the poll was over in many of the boroughs on the first day; and it appears probable that by the erection of a few more booths, and the appointment of additional polling places, the whole number of electors in the cities and boroughs might have been easily polled in one day.

In ten of the counties of England and Wales, which were contested at the same general election, 37,075 voters out of 44,551, or five-sixths of the whole number who voted, presented themselves for the purpose on the first day; and there can be no doubt that if an opportunity had not been given for choosing between one of two days, a very large proportion of those who presented themselves on the second would have done so on the first day of the election. It is certainly possible that some electors might be unavoidably prevented from attending if the election were to be begun and concluded on the same day; but as is remarked in the Report, "some inconvenience will be found from every course that can be adopted, and the question is to be decided on the balance of advantage to the public by the limitation proposed, it being expected that voters will generally accommodate their time to comply with the law."

One part of the Reform Act which has occasioned great vexation and disappointment, is the demand which it sanctions of one shilling from each county elector at the time of claiming to register his right, and from each borough elector at the time of registration, and on every year thereafter. These payments were required in order to defray the expense of making out lists or registers of electors, which expense must otherwise have fallen upon the parish rates. It was thought to be just that those who enjoy the franchise should pay the expense of the registration. Upon this point it is observed in the Report, that "the suffrage is for the benefit of the whole community, and that it is desirable to have as large a number of electors as possible enrolled, whence it becomes a fit question for consideration, whether, if the payment of the shilling operates against registration, and at the same time creates discontent, it ought not to be discontinued." Upon a review of all the circumstances, the Committee have recommended that these shilling payments shall cease to be demanded.

The sums paid to the revising barristers employed under the provisions of the Reform Act at the registrations of 1832 and 1833, and which were defrayed by the Treasury, amounted to 83,364*l.*

By reference to the statements given in the Appendix to the Report, it will be seen that the amount of the returning officers charges for 81 counties and divisions of counties in England and Wales, paid by candidates at the last general election, was . . . £23,289

Additional charges . . 3,707

£26,996

Being, on the average, £333 for each election.

The amount of returning officers' charges against the candidates for 185 borough

elections in England and Wales, was	£21,539	
Additional charges . .	3,273	
		£24,812
Being, on the average, £134 for each place.		
Total for England and Wales . .		£51,808
In Ireland, the amount of the returning officers' charges for the 32 county elections, was .		£7,148
For the 34 boroughs . . .		3,983
Total for Ireland, with the exception of Dublin University		£11,131

The election expenses charged to candidates in Scotland, were so small, as in the opinion of the Committee would "scarcely warrant their notice, unless to call the attention of the House to the expenses of the elections in Scotland as compared with those in England."

It is not pretended that the foregoing statement affords a correct view of the expenses incurred by candidates in England, many of whom undertook personally, or through their Committees, to defray various additional, and not strictly legal charges, of which the Committee could not obtain any account.

We believe it is not generally known, that, with reference to elections for members of parliament in Scotland, whether for cities or burghs, no qualification whatever of property is required on the part of the candidate; upon which fact the Committee has remarked, that "as no practical inconvenience appears to have arisen therefrom, they submit to the House whether the existing laws respecting qualifications of candidates in England and Ireland should not be reconsidered." We should cordially join in a recommendation for doing away with the qualification altogether; not because we would throw open the doors of parliament to needy adventurers, for, practically, the existing system is not found to place any obstacles in the way of such characters when they can prevail upon electors to return them as members. Every question of this kind may safely be left to the discretion of the electors, who should not be restrained from selecting a man in whose ability and integrity they can confide, because his estate is not of sufficient magnitude; and, on the other hand, it appears to be demanded for the sake of the respectability of the House of Commons itself, that all necessity should be removed for having recourse to a subterfuge, which, in other cases, might lay the parties open to the imputation of fraud.

REPRESENTATIVE SYSTEM IN FRANCE.

THE following statement will exhibit the successive measures which have brought the system of representation in France to its present state:—

The constitutional charter given by Louis XVIII. on his return from England in 1814, established the system of representation in a form which has since undergone some considerable modifications, but has not essentially been changed. It prescribed that the Chamber of Deputies should be composed of deputies elected by the electoral colleges in the departments, but with very considerable limitations. It limited the elective franchise to those Frenchmen who, being not less than thirty years of age, pay at least 300 francs (12*l.*) a year in direct taxes. In 1820, it was found that the operation of this law restricted the elective privilege to 90,000 persons; and this number was, by the reduction of direct taxes, subsequently brought down to 80,000, at a time when the population of the country amounted to 32,000,000. It was declared that a citizen to be eligible for election as deputy should not be less than forty years of age, and should pay 1000 francs (40*l.*) a year in direct taxes, either in his own person, or by delegation for his mother, grandmother, or mother-in-law; but if there were not fifty persons of this description in a department, the fifty who paid the highest amount of taxes under 1000 francs were to be eligible. Under this law, which prescribed the qualifications of a candidate, it appears that there were about 20,000 eligible persons in the kingdom. Each elector was to receive an "electoral card" from the prefect; but it was the inscription on the list of voters which was to give the right of voting, and to decide in case of dispute. The presidents of the electoral colleges, who were appointed by the government, were, *ex-officio*, members of the college, but could not vote unless they had the legal qualification of voters. No armed force was to be allowed to be near the place of election, unless at the particular desire of the president; nor could any one, except an elector, whatever might be his station, demand admission into a meeting of an electoral college. The electoral college was to be provisionally organized by the president, who named the members of the provisionary board—that is, the four inspectors (*scrutateurs*) and the secretary. This, however, was merely preparatory to the final organization of the college by the voters, who were to elect four inspectors and a secretary. By laws, subsequent to the date of the charter, absolute secrecy in voting is required; and the following oath is directed to be taken by each elector:—"I swear allegiance to the king, obedience to the constitutional charter, and to the laws of the kingdom."

The "definitive board" being organized, the college was to proceed to the election of the deputy. On the first and second ballots, the candidate who had a majority of all the votes given in, provided it amounted to one more than one-third of the whole number of the electors of the college, was to be declared duly elected. If no election was made on the second ballot, the board was to make a list of double the number of deputies to be chosen, from the candidates who had the greatest number of votes on the second ballot, and the electors had not the power to vote for any candidate whose name was not in this list. Only a plurality of votes was to be necessary to a choice after the second ballot. When it happened that any candidates had an equal number of votes, the eldest was to be considered elected. After the termination of the election, the journal of proceedings was to be read in the presence of the electors, that any error might be corrected. These journals were to be transmitted to the Chamber of Deputies, which should decide on the right of the members to a seat. The electors were then to separate on the command of the president, who was first to destroy all the ballots in their presence.

Since the date of the charter, several alterations have been effected in the details of the system the elements of which we have exhibited. The various measures relating to the representation we shall now proceed to state only so far as they modified any regulation which existed at the time of their enactment.

In 1817, under M. Decazes, various detailed regulations were introduced with the view of diminishing the power of the emigrant party in the elections; and these regulations having been found to operate in facilitating the access of "the men of new France" to the Chamber, were popular in the country; but when, in 1820, the murder of the Duke of Berri was seized by the ultras as a pretext to overthrow the party of Decazes; the number of deputies was increased by the law of June 29, in that year, from 258 to 430. The old number were to be chosen, as before, by all the voters of the department; the additional 172 by the richest electors, that is to say, by one-fourth of all the voters consisting of those paying the highest taxes, who, after having voted with the whole body of electors of the department, were to elect separately, the number of additional deputies assigned to their department. They thus enjoyed a double vote, and the object of the arrangement was to give a preponderance, or at least a countervailing power, to the wealthier classes. Benjamin Constant, in his famous pamphlet, 'Des Motifs qui ont dicté le Nouveau Projet de Loi sur les Elections,' very strongly denounced this measure, which he considered in the light of a victory of the party of the old nobility, not only over the liberals, but also over the interests of the nation, the ministry, and the king personally. The continued influence of the same principles which had produced this measure, seems also to have been evinced in 1824, when, by the law of June 9, in that year, the deputies, instead of being elected for five years, one-fifth of the Chamber being removed every year, as was prescribed by the charter, were directed to be elected for seven years—the whole Chamber at once. As the law of elections stood at this period, the prefect of the department superintended the election, the government appointed the president of the electoral college, and as the members of the government are not ineligible as candidates, as in the United States, and a re-election was not, as with us, necessary on the acceptance of office, the crown, at that time, exercised so much influence over the elections, that it was very difficult, in ordinary circumstances, to get members sent up to the Chamber whose principles were opposed to those of the ministers.

As our object is only to indicate measures which have

been actually operative, we need not here dwell on the abortive attempt of the ministers of Charles X. to alter the law of election, after the elections of July, 1830, had terminated unfavourably to their party.

The Charter, as altered by the Chamber of Deputies after the revolution in July, 1830, deferred the organization of the electoral colleges for future consideration. Meanwhile it reduced the age of qualification for an elector to twenty-five years, and for a deputy to thirty; and directed that the presidents of the electoral colleges should be chosen by the electors themselves.

Before the ministry of M. Lafitte resigned in March, 1831, the new electoral law had been fully brought before the Chamber of deputies. The bill then presented by the government increased the number of persons who should be qualified to vote, but did not fix any particular amount, either of property or taxation, as a necessary qualification. The plan was to double the existing number of votes in each electoral college, and to take the whole number from those who paid the greatest amount of taxation, beginning at the highest in the scale, and gradually descending until the fixed number should be completed. There would under this system have been 188,000 electors. The committee, however, to which, according to the practice of the French Chamber, the bill was referred, rejected this mode of arranging the franchise, on the ground that the electors whom it would create would be in a very imperfect proportion to the wealth and population of the kingdom: that the scheme would render the electoral capacity extremely variable, might be rendered subservient to ministerial fraud, and was repugnant to the decided and unanimous opinion of the public. They resolved therefore to retain taxation as the rule, but to reduce the amount necessary to confer a qualification. The present amount was 300 francs. The committee assumed that experience had shown that this qualification had not introduced an improper class of electors, even when the rights and powers of a representative constitution were new to the country; it might therefore be concluded, that after sixteen years of constitutional education, the electoral qualification might safely be reduced to a point at least one-third lower.

Independently of such considerations, the qualification while apparently remaining fixed had actually been rising in consequence of other changes. The various reductions, which had favoured property since 1814, had produced this effect, that the independence of fortune formerly indicated by paying 300 francs, was now indicated by paying 240, or 250; so that the number of electors had been diminished. Besides, as the spirit of the French law was unceasingly to divide property, it was uniformly increasing the number of those who paid the impost on property, and just as uniformly reducing the number of larger quotas. Under the influence of these various considerations, the committee had at first resolved to propose that the qualification should be fixed at 200 francs of taxation; but the majority had afterwards come to the opinion, that it might be dangerous to make at once so great a change of which it was difficult to foresee the consequences; and that it would be safer and wiser to act progressively, and enlarge the qualification, if necessary, by degrees. The members, too, who formed this majority regarded with apprehension the number of electors that the reduction of the qualification to 200 francs might produce; they dreaded the confusion that might result from it, as well as the change that the real character of the election might receive. They were apprehensive of the action of parties, which must always be more strongly operative upon masses than upon a more limited and intelligent number. It was therefore proposed, that the electoral qualification should be fixed at 240 francs (about 9*l.* 10*s.*) in taxes, with this addition, that in all the electoral arondissements, where the number of electors possessing this qualification should not be in the whole one out of 200 inhabitants, those most heavily taxed beneath the qualifying amount should be included to make up the requisite number. The latter combination, it was calculated, would yield at first 162,000 electors: and, as in seventeen departments the number of electors paying 200 francs would exceed one out of 200 inhabitants, this difference would afford upwards of 29,000 electors more. Thus the system regarded as the best by the majority of the committee, would afford a total of 191,000 electors, more than double the existing number, deriving their qualification from the payment of a certain amount of taxes. Of this number Paris would furnish 19,000. The double vote and separate elections were also abolished. Members of the Institute and retired officers of the army and navy, enjoying half-pay to the amount of about 50*l.* a year, were to be allowed to vote on a qualification of only 100 francs, or 4*l.* The qualification for being elected was to be reduced from 1000 to 500 francs, or 20*l.*

The opinion of the majority of the committee, as to the qualification, was by no means satisfactory to the *mouvement* party in the Chamber, who succeeded in bringing back the franchise to the rate which the committee itself had originally adopted, namely, 200 francs of taxes instead of 240, and in getting it enacted that the next highest payers below that point should be included, not when the number of electors was smaller than one in 200 inhabitants, but when it was smaller than one in 150. It was expected that this reduction would raise the number of electors to considerably above 200,000 in a population exceeding 30,000,000.

From this statement it will appear that the changes which have taken place in the representative system in France, and the extension of the franchise have been much less considerable than might have been expected to result from the revolution of July, and, that though highly important in themselves, they still leave the Chamber of Deputies an assembly much less popularly constituted than the Reform Bill has rendered our own House of Commons.

REDUCTION OF CUSTOMS DUTIES.
SESSION 1834.

In our last Number we inserted an abstract of a return made to the House of Commons of all the taxes remitted or repealed since 1814, with a list also of those partially remitted or repealed, and the date of remission, &c. The return from which our abstract was made did not, and could not, include the reductions made in certain duties of customs, by the act 4 and 5 William IV., c. 89, which received the royal assent on the last day of the late session. We now proceed to supply the deficiency, showing in separate columns the rates of the old duties, and those on which the different articles may now be brought into consumption.

	Duty before the passing of the late Act.			Present Rate of Duty.		
	£.	s.	d.	£.	s.	d.
Apples dried, the bushel	0	7	0	0	2	0
Books in the foreign living languages, being of editions printed in or since 1801, bound or unbound, the cwt.	5	0	0	2	10	0

Plantains, dried, from British possessions in America, for every 100*l.* of the value	20	0	0	5	0	0

	Duty before the passing of the late Act.	Present Rate of Duty.
Pears, dried, the bushel	£.0 10 0	£.0 2 0
Plums, commonly called French plums, and prunelloes, the cwt.	1 7 6	1 0 0
Prunes	1 7 6	0 7 0
Raisins	1 0 0	0 15 0
Raisins from any British Possessions	0 10 0	0 7 6
Spirits, liqueurs, the produce of British possessions in America, of proof strength, the gallon	1 0 0	0 9 0

The same act likewise repeals the duty of 3*s.* 4*d.* the ton on coals, and of 2*s.* per ton upon small coals, culm, or cinders, when exported to any foreign port in a British ship; and it also reduces the duty from 6*s.* 8*d.* to 4*s.* per ton when the shipment is made in a foreign vessel.

The greater part of the reductions here stated have been made upon the principle acted on by the late ministers during their continuance in office, of removing impediments which stood in the way of foreign trade, and of enabling our manufacturers to obtain the materials required for their various processes at a cheaper rate than heretofore, increasing by that means their power of successful competition with rival manufacturing countries.

The effect just mentioned has been produced by the repeal of half the duty upon oil, an article of high importance to the woollen manufacture; and this reduction has the further good effect of making us less dependent than we have been upon Russia for a supply of tallow, for which article oil may be extensively substituted. The duty on candles ceased on 1st January, 1832, and in May, 1833, (not 1830 as by a typographical error was stated in our last Number,) one half of the duty on soap was remitted; by which measures the demand for tallow has been so greatly increased that its price has risen nearly thirty per cent., an advance which has been principally to the advantage of the merchants of St. Petersburgh.

The reductions made in the rates of duties on currants, figs, and raisins, will place those articles more within the reach of the humbler classes of this country than they have hitherto been, and will at the same time tend to the encouragement of a branch of trade— that with Greece and Turkey —which already absorbs a considerable quantity of British manufactured goods. It is a singular fact that vessels are despatched loaded with the produce of the looms of England to ports in the Mediterranean, and either return home in ballast or proceed to the Baltic for cargoes of Russian tallow, while many other ships are every year sent out in ballast from England to St. Petersburgh for the last-mentioned purpose. We may now expect that the vessels which convey cargoes of British goods to the Mediterranean ports, will find a more direct way home loaded with the oil and fruits of that region.

The reduction of the duty on prunes, French plums, &c., if followed up by similar abatements upon other kinds of French produce, would be found productive of equally good results; for we consider it to be quite impossible for the government of France to uphold the interests of the few who desire to exclude our productions, against the feelings of the great body of the people who must desire to purchase those goods which we can give them so much cheaper and better than their own country affords, if we deprive the advocates for exclusion of the argument, of which they now so adroitly avail themselves, offered by the excessive duties levied upon the wines, spirits, fruits, and some other productions of that kingdom.

Some few of the articles comprised in the foregoing schedule are now for the first time admitted into our tariff— those are cassava powder or starch, palmetto thatch, animal oil, and dried plantains. The first and second of these articles are understood to have been so admitted at the instance of the colonists of the Bahama Islands, where their former staple, cotton, can no longer be profitably raised, and where some new branches of industry require to be fostered into existence for the employment of a numerous population, who have now but little settled or regular employment. Cassava powder may be very abundantly and cheaply produced by the labour of women and children, and is calculated for general consumption as a substitute for arrow-root. Palmetto thatch is the midrib of the leaf of the palmetto. It can be readily separated into thin *laminæ*, and used for the making of plat for coarse hats and bonnets. A good deal of this article has of late been purchased by American traders in the Bahamas, and used in the United States for the purpose here mentioned. It can be abundantly obtained likewise from the coast of Africa, and the introduction of additional incentives to industry in that quarter must be hailed with satisfaction by every friend of humanity. Animal oil has been admitted by name into our tariff, in order to encourage our trade with the States of the Rio de la Plata; and dried plantains will, it is thought, be found an agreeable ingredient at the dessert, where they may be eaten in the place of figs. These articles might all have been imported before the passing of the late act, as "unenumerated goods," upon payment of the high rates of duty set against each of them in our first column, but which in fact amounted to prohibition.

PARLIAMENTARY ABSTRACTS.

BRITISH COLONIES.—*Actual Annual Cost to Great Britain, as Military Establishments, of the undermentioned Colonies, taken from the Returns of* 1832:—

Gibraltar	£.172,439
Malta	100,462
Cape of Good Hope	99,928
Mauritius	99,332
Bermuda	67,216
Heligoland	500
Ionian Islands	102,899
Jamaica, Bahamas, and Honduras	141,605
Windward and Leeward Islands	386,631
Lower and Upper Canada	208,248
Nova Scotia, New Brunswick, Prince Edward's Island and Newfoundland	143,568
Sierra Leone and Gambia	28,002
Ceylon	116,844
Western Australia	3,481
New South Wales and Van Diemen's Land	90,339
Total	£.1,761,505
To this total must be added the following items:—	
Provisions and stores for troops on passage to the Colonies	18,119
Stores and other general charges	11,943
Which increases the amount to	*£.1,791,569

Number of Governors of Sierra Leone since 1816.—Sir Charles M'Carthy was appointed in 1816; killed in action with the Ashantees in 1824. Major-General Turner succeeded him; he went out in 1825, and died in 1826; his death may be attributed to his exertion in putting down the slave trade on that coast. The next appointment was Major-General Sir Neil Campbell, in June, 1826; he died in the year following, as it was supposed owing to anxiety in such a climate. The next officer appointed was Lieutenant-Colonel Denham, in 1827. Before that time he filled the office of superintendent of the liberated Africans. Having travelled much in the interior of Africa before his appointment, his death marks the pestilential nature of the climate of Sierra Leone. Major Ricketts, his successor, was obliged to come home from ill health in 1829; and Lieutenant-Colonel Findlay was appointed in 1830; he also came home, and Mr. Temple was appointed in June, 1833. [Mr. Temple is also dead. The present salary of the governor is 2000*l.*]

Cape of Good Hope.—The Cape of Good Hope was taken from the Dutch in the year 1795. It was ceded to Holland in 1803; and in 1806 it was again captured by an expedition sent out from England under the command of Sir David Baird. The amount of population is supposed to be from 120,000 to 125,000, but this is daily and rapidly increasing by emigration. The extent of the territory there in our possession is about 146,000 square miles. Distribution of military force on 1st February, 1834:—

Cape Town:—	Royal Artillery, rank and file	45	
,,	Royal Engineers	7	
,,	72nd Highlanders	484	
,,	75th regiment	7	
,,	98th ditto	484	
,,	Mounted Rifles	7	
			1,034
Graham's Town:—	Royal Artillery	27	
,,	Royal Engineers	20	
,,	75th regiment	482	
			529
Fort Beaufort:—	Mounted Rifles		226
	Total		1,789

* The apparent error in this total is occasioned by the omission of fractional sums.

The staff consists of eighteen individuals. The state of the finances at the Cape, during the last few years, has been such that the civil establishment could not be maintained by the colony, the deficit for 1831 and 1832 amounting to 7000*l.* The distance from Cape Town to Graham's Town is about 600 English miles. The following is a statement of the number of governors, with their salaries:—

1795.	General Craig, salary not stated.	
1797.	Lord Macartney . .	£.10,000
	and a table allowance of 2,000*l.*	
1799.	Sir George Yonge . .	10,000
1806.	Sir David Baird . .	7,400
	[During this governorship Major-General Grey drew a salary of 3000*l.* as lieutenant-governor.]	
1807.	Major-General Grey .	7,400
—	Lord Caledon . .	10,000
1811.	Sir John Craddock . .	10,000
1814.	Lord C. Somerset . .	10,000
1820.	Sir Rufane Donkin . .	5,000
1826.	Major-General Bourke . .	5,000
	[These two gentlemen were lieutenant-governors in Lord Somerset's absence.]	
1828.	Sir Lowry Cole . .	7,000
	with an allowance of 500*l.* for a country residence.	
1833.	Major-General Sir Benjamin D'Urban	5,000

Ceylon.—This island was taken from the Dutch in 1795; the arrison of Colombo, however, did not capitulate till February, 1796. It was transferred from the charge of the East India government to that of the British in 1798. The amount of military force employed on 1st September, 1833, was 3732. The present population of the island, according to the latest return in 1832, was 998,000. The salaries of the governors have been 10,000*l.*, with military allowances according to their rank, until the present governor, Sir Robert Wilmot Horton, when the salary was reduced to 8000*l.*, and all future governors are to receive 7000*l.*

Emoluments of Governor and Lieutenant-Governor of Gibraltar.—Lord Chatham was appointed to the government of Gibraltar on 5th March, 1820.

His salary as governor was .	£.2,800	0	0
Pay as commanding-officer .	3,500	0	0
Army ordinaries . .	691	19	7
	£.6,991	19	7

Besides the allowance of rations, &c. 700*l.*

During the governor's presence the lieutenant-governor received

Pay as lieutenant-governor .	£.365	0	0
Army ordinaries . . .	346	15	0
	£.711	15	0

with the usual allowances. But during the governor's absence, he received, in addition to the above pay, the pay of an officer commanding the garrison, 3500*l.*, which raised his emoluments to 4311*l.* 15*s.* His Majesty's government decided in 1831, that when the office of governor became vacant, the salary should be 5000*l.*, without any allowances whatever.

Malta.—The population of Malta is 99,000, without reference to troops, or accidental inhabitants. The annual revenue of the island is upwards of 100,000*l.* The governor's salary is 5000*l.*

Ionian Islands.—The Ionian States were placed under the protection of the British government, by an arrangement with the powers of Europe, and an article of the Treaty of Paris. The names of the islands, with the effective force in each, are, Corfu, 1524; Vido, 522; Paxo, 23; Santa Maura, 125; Cephalonia, 367; Zante, 304; Ithaca and Calamos, 50; Cerigo, 67; total effective force, 2982. The present Lord High Commissioner receives 5000*l.* yearly, without any allowances.

Table showing the relative health of the Troops in the following Colonies:—

Period.	Ceylon.		Ionian Islands.		Mauritius.		Jamaica.	
	Troops.	Sick.	Troops.	Sick.	Troops.	Sick.	Troops.	Sick.
June, 1831	3,979	116	3,133	112	1,750	137	2,882	93
Jan., 1832	3,940	120	3,077	76	1,754	169	2,659	118
June, 1832	3,827	98	3,069	89	1,714	149	2,797	114
Jan., 1833	3,689	128	2,983	85	1,794	165	2,957	228
August, 1833	3,933	117	3,023	120	2,243	182	3,397	225

Return showing the Annual Average Strength of the Black and White Troops on the West Coast of Africa, and the proportion of Sickness and Mortality, from 1827 to 1833.

Year.	Annual Average Strength.		Totals of Sick Treated.		Totals of Deaths.		Annual Proportion of Treated to Strength.		Annual Proportion of Deaths to Strength.	
	White.	Black.	White.	Black.	White.	Black.	White.	Black.	White.	Black.
1827	345.5	749.25	1,042	790	50	47	1 to 3.01	1,05 to	1 to 6 91	1 to 15. 94

Note.—The returns for 1833 are not complete.

Bankruptcy Analysis from November 26 to December 26.

Bill-broker, 1; booksellers, 3; brewer, 1; builder, 1; cattle-dealer, 1; carpenters and joiners, 3; coach-master, 1; clothiers, 4; colour-manufacturer, 1; corn-merchants, 2; drapers, 4; factor, 1; farmers, 2; flax-spinner, 1; grocers, 5; hardwareman, 1; hat-manufacturer, 1; horse-dealer, 1; innkeepers, 6; ironmonger, 1; insurance-broker, 1; law-stationer, 1; leather-seller, 1; lead-merchant, 1; linen-manufacturer, 1; linendrapers, 5; merchants, 9; mercer, 1; miller, 1; money scriveners, 3; nail-maker, 1; optician, 1; paper-maker, 1; plumbers, 2; printer, 1; printseller, 1; ribbon-manufacturer, 1; salt-broker, 1; scrivener, 1; seedsmen, 2; sheep-jobber, 1; ship-builder, 1; shoemaker, 1; silk-printer, 1; stable-keepers, 3; stationers, 2; stage-coach proprietor, 1; stone-masons, 2; surgeons, 4; tanner, 1; tavern-keeper, 1; tailors, 6; timber-merchant, 1; trimming-seller, 1; victuallers, 6; veterinary surgeon, 1; watchmaker, 1; wine-merchants, 5; wool-merchant, 1; woollen-cloth manufacturer, 1; woollendrapers, 2; wharfinger, 1—total, 121. Total from the commencement of the year, 1051.

In consequence of the insubordination of its pupils, the Polytechnic School has been partially suppressed.

The French Carlist or Absolutist newspapers hail the formation of a Tory cabinet in England with rapturous delight. They have, indeed, gone so far in expressing their hopes and expectations from this change, that our Ultra-Tory journals have been obliged to call them to order. The republicans, also, seem to hope for some good to their cause —in the way of confusion.

It is understood that Prince Talleyrand has declined returning as ambassador to London, and that the Duke de Broglie will have the appointment.

SPAIN.

It should appear that the veteran Mina has not, as yet, been able to do much in the revolted provinces in favour of the young Queen and the Constitution. It is certain, however, that he has received considerable reinforcements and some money, and, in spite of the frequent, but contradictory assertions of the Carlist faction, has gained rather than lost ground. There is now a talk at Madrid of confirming the Biscayan provinces and Navarre in the possession of their *fueros* and other ancient rights and privileges. Such a measure will be more likely to restore tranquillity to that northern corner of Spain (the centre and stronghold of the insurrection) than the sanguinary proclamations and military executions we alluded to last month. Had such a measure, indeed, been adopted at first, we doubt whether arms would ever have been taken up for Don Carlos. Until well-authenticated intelligence of some decisive operations reach us it is an idle loss of time to attend to this warfare. The rumours and statements so rapidly and confidently circulated are scarcely in a single instance to be depended upon. They are drawn up and coloured by one contending party or by the other; while many of them originate in the inventive imaginations of the Stock Exchange. It must be remembered that Don Carlos has loans in the market as well as the young Queen. M. Jauge, one of his bankers, or loan agents, has just been released from prison at Paris. The Baron Haber, another of his agents, has circulated proposals for a loan at Paris and Amsterdam, the terms being 65 for 100; 10 per cent. to be paid at once, 5 per cent. on the 10th of February, 1835, 10 per cent. in a fortnight after Don Carlos has been recognised as king at Madrid, and 40 per cent. in four monthly instalments afterwards. The information, that Martinez de la Rosa had resigned, was incorrect: the war portfolio, which he held *ad interim* on the retirement of Zarco del Valle, has been definitively given to General Llauder. Reports are, however, still current that Martinez de la Rosa's health must oblige him to quit office, and the Count de Toreno is again named as likely to succeed him as head of the cabinet.

The new Cortes loan, for 4,000,000*l.* sterling, has been contracted at 60 per cent. with 3 per cent., commission for one half; for the other half at 66, in case there should be a rise to a certain degree in the funds,—a rise that might very well take place from the cessation of civil war, and from moderation and wise conduct on the part of the Cortes and government. For the present, this new loan is but coolly viewed on our Stock-Exchange. The blunders of the Cortes in their frequently changed decisions about the former loans raised by Spain, if not wholly, have contributed largely to produce this effect.

According to letters from Madrid of the 8th of December, the budget was to be discussed on the following day. The finance committee proposed that the incomes allotted to the Queen and Royal Family should not exceed about 400,000*l.* sterling for the whole.

General Alava has been appointed to succeed Count Florida Blanca as ambassador to England.

Intelligence rather more interesting than usual has just been received from the seat of war. On the 12th, Mina defeated Erazo at Carrascal, and on the same day, Zumalacarreguy, with the main body of the insurgent army, was beaten by Lopez and Oraa at Sorlada.

The same arrivals also announce the following parti-

[redacted] Chamber of Procuradores at Madrid were engaged in debating several important questions. Seventeen members had presented a petition praying for the recognition of the independence of the South American States, citing the example of England in recognising the independence of the United States as one that ought to be followed, and showing that, by such a measure, the mother-country would be as much benefited as the emancipated colonies. Martinez de la Rosa declared that government was perfectly ready to enter into that question. The minister added, "An illustrious procer, just set out for London as minister for her Majesty (General Alava), in order to unite the more strictly the Cabinets of Great Britain and Spain, is the bearer of instructions on this important topic; and a commissioner from America, who has presented himself, being provided with sufficient powers, has received passports and a guarantee from the Spanish government in order to come for the purpose to this capital (Madrid), which in consequence of illness he has not yet been able to effect. As the Spanish government bears the device of making no mystery of its intentions, it has transmitted a manifest to some of its allied powers, declaring that it was resolved to proceed immediately to a definitive regulation on the question of America."

The budget had undergone some discussion, and the grant for the royal family had met with rather a violent opposition.

The capital remained perfectly tranquil.

PORTUGAL.

The last month's news from this country is even still less interesting than that from Spain. Two important facts may, however, be stated: no serious insurrection or even riot has broken out, and Don Miguel has not returned to renew the contest.

The Duke of Leuchtenberg, to whom Donna Maria has been formally and solemnly betrothed (her minister, Palmella, acting as proxy for the Duke,) had not arrived at Lisbon when the last mail left, but was expected in that city towards the end of December.

On the production of the Budget, there appeared a deficiency of about 700,000*l.*, but the Minister of Finance has stated that he shall be able to meet this without imposing any new taxes.

Some of the good people of Lisbon are said to complain bitterly of the heavy expenses they incur by their Cortes. In Portugal, as in the United States of America, and other constitutional countries, every member is paid a certain sum *per diem* during his attendance on the business of the State. It appears that a member of the Lower Chamber, or House of Commons at Lisbon, receives about 18*s.* a day. The work cannot be very hard—the Chambers open at ten in the morning and close at four (precisely) in the afternoon. Since their convocation the Chamber of Deputies or Commons may altogether have cost the Portuguese nation between five and six thousand pounds sterling—no great sum, even there, for four or five months of legislating. But ignorance is apt to be very stingy in these matters. When the Constitution was proclaimed at Naples, there were many who thought it meant no taxes, no duties, no imposts of any kind; and when they found out their mistake, these Neapolitans cared not what became of "*La Costituzione.*"

BELGIUM.

As soon as the unwelcome and unexpected news of the dismissal of the Whig Cabinet reached the capital of this beautiful little kingdom, Leopold considered himself under the necessity of instantly demanding more money from the States then assembled. On the 8th of December the Minister of Foreign Affairs went down to the Chamber of Deputies, and alluded to the change, "which had excited uneasiness in the friends of Belgium, and given a gleam of hope to the enemies of the independence of that country;" he, therefore, in the name of Government, proposed an addition of ten per cent., to be levied indiscriminately on all taxes. He said that Belgium had nothing to fear from a contest with Holland *alone*, but that it behoved her to reinforce her army in the same proportion the King of the Dutch was doing.

A vote of credit was also proposed, of which Government will make no use, unless circumstances render it necessary.

On the 12th of December the Chambers voted the Budget of Ways and Means to the full amount proposed by the Cabinet. Intelligence was received from Brussels early in December, that the Dutch troops on the frontiers of Belgium were receiving extraordinary reinforcements. From the advanced period of the year no immediate hostilities were expected; but, in the opinion of many of the Belgians, the hostile appearances would serve to explain how William I. of Holland understood the change in the ministry of William IV. of England. The embarrassing question of the Grand Duchy of Luxembourg remains just as we left it at the end of last year. The Duke of Nassau is said to refuse pecuniary or any other kind of compensation for the sacrifice of his reversionary rights to the part of Luxembourg ceded to Belgium by treaty. It is asserted in some quarters that the overthrow of the whole system that arose out of the Brussels Revolution of 1830, and the breaking up of the New Belgian Kingdom, will begin with Luxembourg. That a protocol from the Germanic Diet will be presented to King Leopold's Government, stating, that the integrity of the territory of the Germanic Confederation must be preserved, and that the Belgians must evacuate the whole of the Grand Duchy of Luxembourg without loss of time. And, further, that the King of Prussia will be named by the Confederation, and provided with a sufficient force drawn from the contingent of the different German States, to carry this protocol into execution. The Emperor of Russia has been consulted, and, it should seem, has given in his adhesion to this plan.

This whole question, which was always an embarrassing one, was left as a legacy to the Whigs by the Tories when they lost office in November, 1830. The Whigs were hampered from the beginning by difficulties that were not of their own creating—they had to bear the heavy and inevitable burden of the mistakes and faults of their predecessors in office. We can scarcely conceive how the Tories could ever have the unblushing countenance to revile and attack a Cabinet that manfully and dexterously bore the burden which *they* had put on its shoulders. If the Whigs did not effect a final and complete arrangement, they, year after year, narrowed the ground of debate, and had the merit of preserving a peace (which seemed altogether impossible when they entered on office) for four whole years. That the King of Holland, the Duke of Nassau, and other litigant parties are now less inclined to an amicable arrangement with Belgium than they were this time last year, is certainly not to be imputed to the Whigs, but to recent events. However, the riddle is now in the hands of those who helped to make it. We shall see *how soon* and *by what means* a Tory Cabinet will solve it.

The Belgians seem to have been alarmed by an assertion made by a journal of the Orange party, that a marriage had been arranged between the Princess Victoria of England and Prince William Alexander Constantine, second son of the Prince of Orange. We think the alarm premature, and the alliance a most unlikely one. At all events the days when royal marriages and family compacts exercised a paramount influence on the affairs of the world are gone by.

UNITED STATES OF AMERICA.

The elections have ended favourably to General Jackson and his party. The quarrel between the President and the National Bank, which bore an important and somewhat doubtful aspect at the end of last year, may therefore be considered as good as settled. Considerable majorities will enable the President to dispose of the incorporated United States' Bank in the way he proposes, which is to destroy it, or at least to deprive it of all its peculiar privileges and influence.

PERSIA.

A short paragraph has appeared in the newspapers, announcing that our government has received, through Russia, official intelligence of the death of Futteh Ali Shah, the King of Persia. Though briefly noticed, this event, in the present distracted state of the East, is likely to produce important consequences, and to plunge Persia both into a foreign and a civil war. Even in the life-time of the late hereditary Prince Abbas Mirza, who was a man of mature age and experience, and not destitute of courage and abilities, Mr. James B. Fraser and other gentlemen well acquainted with the country, were of opinion that the crown of Persia must soon pass away from the present dynasty. But the danger is greatly increased now that the succession to the throne rests with a less experienced and clever man (the son of Abbas Mirza), who is styled Mohammed Mirza. Two reigns have seldom passed in Persia without a disputed succession, attended with horrible cruelties and devastations. At times, nearly every province in the kingdom has had a pretender to the crown. Unlike the Turks, who have paid such constant reverence to the line of Osman *, every powerful Persian chief seems to have considered himself possessed of claims to the sovereignty. If he could obtain it by force of arms, he strangled, blinded, or mutilated his rivals, with their children, relatives, and friends; if he failed, the like fate befel him and his.

The present Kujur dynasty began to reign over all Persia about fifty years ago. The first monarch of the line was the atrocious eunuch Aga Mohammed Shah, who was succeeded, in 1797, by his nephew Futteh Ali Shah, the king that has just died.

For a Persian sovereign he was neither considered cruel, rapacious, nor unjust. He had, it is true, most treacherously and barbarously murdered his uncle Saduk, tortured and blinded his faithful old minister Hajji Ibrahim, and then caused his tongue to be cut out (under which operation the old man died). Nay, he had even included Hajji Ibrahim's sons and brothers in the proscription, because they were held to be very rich: and these individuals, being all seized at the same moment, were murdered or deprived of their eye-sight! But this was a trifling amount of blood and torture for a Shah of Persia, and compared with his immediate predecessor, Futteh Ali was an angel of mercy.

As to his non-rapacity and justice, he merely got money in every way that he possibly could. He frequently bastinadoed merchants and others suspected of being rich, in order to obtain a part, or sometimes the whole, of their property. He was accustomed to sell his daughters, and even the women of his own harem, to rich Persian khans, who were made to give a high price for what they did not always like or want. His avarice, in fact, was insatiable, and no means were considered too low or base if he could acquire money by them. Had it not been from the improvident indulgence of this passion, he might have saved himself no small losses; and some of the provinces that have become Russian might have still been Persian.

He was no warrior: on the contrary, he was rather suspected of cowardice. He was not much of a politician: but he wrote poetry, and his elegant manners *in private* have been made the subject of high praise. In short, he was a goodly model of a sovereign, and such as the East does not often see!

Mohammed Mirza, who, if he is lucky, is now Shah, served under his father, the late Abbas Mirza, in the last unfortunate campaign against the Russians. In the beginning of September, 1826, the young prince sustained a severe check; and a few days after, his father having rashly attacked the disciplined forces of Russia under General Paskewitch, was completely beaten from the field. The Persians fled in all directions, but not until they had plundered Abbas Mirza's own camp. The young king's initiation in the arts of war has not, therefore, been very propitious; nor can he do otherwise than stand in dread and awe of his powerful, encroaching neighbours, the Russians.

The following remarkable passage is from the pen of a gentleman we have already mentioned, and who has resided in Persia as a diplomatic agent of our East India Company.

"It is indeed manifest that the downfal of this Kujur dynasty, short as their reign has been, is fast approaching, and that if the heir apparent (*the late Abbas Mirza then stood in that position*) succeed in preserving his crown for a season, it will be more from the operation of foreign influence and political jealousy, than by the exertion of any power or popularity that he is likely to acquire. The very name of the Kujurs is detested throughout the kingdom; and it is notorious that pressing petitions have been made on the part of the greater number of the chiefs and nobles, backed by the earnest wishes of all ranks, for permission to throw themselves upon British protection, declaring that all

* The reigning Sultan Mahmoud and his two sons are the only male remnants of this ancient line, with the existence of which the Turks believe their existence as a nation to be identified.

they look for is peace and security, and protesting, that should their application be rejected, they will rather submit to Russia than continue any longer subject to the misrule and extortion of their present masters." *

Putting aside other considerations, what the British could do with so turbulent, fickle and treacherous a nation as the Persians, would be rather difficult to determine. The acquisition of the country by the Russians would, however, bring that power a step nearer to India; and though many and difficult after-steps would remain, this first would be a most important one. That the czar, if not opposed by other things and circumstances than the arms of the shah, could seize the greater and best part of Persia in six months we are perfectly convinced, but we do not believe that he will. The system of Russian aggrandizement is gradual and slow. The Emperor Nicholas will probably content himself for the present with a province or two, to square the advanced frontier he has already obtained on Persia. This subject merits attention.

It appears that on the refusal of the Hon. Mountstuart Elphinstone, the Right Hon. Henry Ellis has been appointed to proceed as envoy to Persia, to congratulate the new king on his accession.

* "Historical and Descriptive Account of Persia." By James B. Fraser, Esq., 1834.

CHRONICLE OF OCCURRENCES.

Nov. 30. The Duke of Gloucester expired at his residence in Bagshot park, at twenty minutes before seven o'clock on Sunday evening. His royal highness had been ill for a fortnight previous to his death. He was governor of Portsmouth and ranger of Bagshot park. His royal highness's style was:—Prince William Frederick, Duke of Gloucester and Edinburgh in Great Britain, Earl of Connaught of Ireland, K.G., Grand Cross of the Bath and of the Guelphic Order, a field-marshal, colonel of the Scots Fusilier Guards, chancellor of Cambridge University, and lord high steward of Gloucester. He was born at Rome, January 15, 1776; succeeded his father, the late duke, Aug. 25, 1805; and married, July 22, 1816, his first cousin, her royal highness the Princess Mary, sister of his present Majesty. His royal highness's father was the third son of Frederick Lewis, Prince of Wales. His royal highness married, September 6, 1776, Maria, Countess Dowager Waldegrave, daughter of Sir E. Walpole, who died in 1807; he had issue —1, Sophia Matilda, born May 29, 1773. 2, Caroline Augusta Sophia, born 1774, died March, 1775; 3, William Frederick, the last duke. The funeral took place on the night of the 11th Dec.

Dec. 5. Thomas Pringle, Esq. died at his residence in Bryanston-square, London, aged 46. He was the editor of Blackwood's Magazine during the first six months of its existence, and for several years was secretary to the London Anti-Slavery Society. He was highly esteemed as a man of much intellectual power, combined with strict religious and moral worth.

6. The Rev. Edward Irving died at Glasgow, in his 43rd year.

The parishioners of Birmingham have not paid church-rates for three years, the incidental expenses of churches and chapels having been defrayed by voluntary subscriptions. It was, however, resolved, that an effort this year should be made to obtain a compulsory assessment. The poll for and against the rate closed on Saturday afternoon, the 13th. The result gave a gross majority against the rate, of 4976; the numbers being 6699 to 1723. A scrutiny, however, has since been demanded, the result of which is not yet ascertained.

Political Meetings.—The following is a notice of the more remarkable of the political meetings which have occurred during the month:—

Nov. 27. The Court of Common Council of London met, and, after a long discussion, an address was voted by a majority of forty-nine, to be presented to his Majesty, expressive of regret at the dismissal of the late ministry, and avowing a firm conviction that unless those appointed to succeed, proceeded to reform all abuses in church and state, no confidence would be reposed in them.

Dec. 2. A meeting was held at Covent Garden, of the electors of Westminster, at which the High Bailiff presided. On the evening of the same day, another meeting was held at Finsbury. The resolutions passed at both meetings were similar, expressive of a determination on the part of the people not to be deprived of the fruits of the Reform Bill. A meeting of the Mary-le-bone electors had been held on the previous day, for the same purpose. Various meetings also have taken place in Lambeth, the Tower Hamlets, and other metropolitan districts, which we have not space to enumerate. On the 19th of December, the large room in the London Tavern was crowded by the citizens of London, who had been refused the use of the Guildhall by the Lord Mayor, and who met to pass resolutions, and to appoint committees for securing the re-election of Messrs. Wood, Grote, and Crawford. Alderman Wood took the chair. The three Members addressed the meeting, and pledged themselves to a strenuous opposition to the new ministry.

On the 23rd a most tumultuous meeting took place at the City of London Tavern. The avowed object of the meeting was to vote an address to the King expressive of approbation of his conduct, in the dismissal of the late ministry; but that object was defeated by a strong muster of those opposed to it, and after a scene of extraordinary confusion, the meeting broke up without passing any resolutions, the committee retiring into a room, for the purpose of enabling them to do so. The opposite party then adjourned to the Old City of London Tavern, where, at a crowded and overflowing meeting, strong resolutions were passed, declaratory of the determination of those present to resist any attempt to stop the progress of reform.

On the same evening, and within a short distance of the place where this extraordinary scene occurred, the Lord Mayor gave, at the Mansion House, a dinner to Sir Robert Peel, the Duke of Wellington, the Lord Chancellor, and others of the new ministry, with a select party of friends. Sir Robert Peel, on his health being drank, gave a brief exposition of the principles on which the new ministry intended to act, and expressed a hope that it would be supported.

Numerous meetings have been held in the counties, of which but a few can be selected. Chatham, Rochester, and Strood met in the Bull Inn yard, at Rochester, on Dec. 1. Nearly five thousand persons were present. The Assembly Rooms were the meeting, and T. Bentley, Esq. took the chair. The resolutions were declaratory of attachment to reform. On the same day a meeting was held at Ipswich, and a number of speeches made, in support of the conservative cause. 300 gentlemen sat down to dinner, and 100 applications for tickets were rejected.

On the 2nd of Dec. a meeting was held at Gloucester, the Mayor in the chair. Mr. Parker and Mr. Phillpotts, M.P., moved and seconded an address, which, with all loyalty to the King and respect for his prerogative, expressed the deep regret of the meeting at the late change in his councils. Mr. Colten moved a counter address, thanking the King for the change he had wrought, but it was withdrawn, when the original address was carried.

On the 4th of Dec. Lord Palmerston and Sir George Staunton met a large body of their constituents, at which they explained their Parliamentary conduct; and on the 11th another meeting was held, which passed resolutions declaratory of the determination of the electors to support them. On the 1st Dec. a deputation of the inhabitants of Derby presented an address to Lord Melbourne, at Melbourne Hall. It expressed regret at the extraordinary and unprecedented manner in which he and his colleagues had been dismissed, as also approbation of the general policy of the government of which he had formed the head. Lord John Russell dined with a large party of his constituents at Totness, on the 2nd of Dec. In his speech he gave a summary of the principal events that have occurred since 1828, in the course of which he contended that the abolition of the Test and Corporation Acts, and of the Catholic disabilities, by the Duke of Wellington, had been in reality forced upon his Grace by the Opposition. The meeting agreed unanimously to support him, and to ask no pledges.

On the 17th Dec. about eight hundred members of the Buckinghamshire Agricultural Association dined at the County Hall in Aylesbury. The Duke of Buckingham took the chair. The company consisted principally of the neighbouring gentry and their tenants.

19. A meeting of the nobility and gentry of West Kent took place at Maidstone. Lord Mahon was in the chair, and among those present were the Earl of Winchilsea, Lords Bexley, Brecknock, Farnborough, Maidstone, &c.

In Dublin, an association was formed, shortly after the news of the dissolution of the late ministry reached Ireland, which has been termed the 'Anti-Tory Association,' and which includes nearly forty members of Parliament: it has held meetings regularly during the month. On the 18th of December an aggregate meeting of the citizens of Dublin was called at the Royal Exchange, George Evans, Esq., M.P. in the chair, which was attended by Messrs. O'Connell, Sheil, &c. The Duke of Leinster and others sent apologies for not being able to attend. Resolutions were passed, declaratory of hostility to the administration newly formed, but the meeting was rendered very tumultuous and stormy by the presence of a small band of persons of opposite sentiments, whose conduct led to various breaches of the peace.

The meetings in Scotland have been very numerous, but our limited space prevents any enumeration of them.

CHANGES OF ADMINISTRATION AND HISTORY OF PARTIES. PART II.

[Continued from last Number.]

3. REIGN of George I., from 1st August, 1714, to 10th June, 1727.

The decisive steps that were taken as soon as Queen Anne had breathed her last, by the friends of the House of Hanover, prevented any opposition being made to the accession of George I. The course that was followed had indeed been prescribed by the act passed in 1706, for securing the succession of the crown in the Protestant line. A general meeting of the members of the Privy Council without distinction of parties, immediately took place: and before this assembly instruments, signed by the Elector of Brunswick (the new king,) were produced by the Archbishop of Canterbury, the Lord Chancellor, and the Hanoverian Resident, M. Kreyenberg, nominating eighteen noblemen to act as Lords Justices of the kingdom, along with the seven great officers of state appointed to exercise the government by the act of settlement. The great officers were Dr. Thomas Tenison, Archbishop of Canterbury: the Lord Chancellor Harcourt; the Duke of Buckingham, Lord President of the Council; the Duke of Shrewsbury, Lord Treasurer; the Earl of Dartmouth, Lord Privy Seal; (he had been removed to this office from that of Secretary of State, in the preceding year, when Bromley the Speaker came in, Bishop Robinson having resigned his place in the cabinet on being appointed to the see of London); Thomas Wentworth, Earl of Strafford, First Lord of the Admiralty; and Sir Thomas Parker (afterwards Lord Parker, and Earl of Macclesfield) Chief Justice of the King's Bench. The Duke of Shrewsbury's name stood also first on the list of noblemen added by the King. The others were the Dukes of Somerset, Bolton, Devonshire, Kent, Argyle, Montrose, and Roxburgh; the Earls of Pembroke, Anglesea, Carlisle, Nottingham, Abingdon, Scarborough, and Orford: Viscount Townshend, Lord Halifax, and Lord Cowper. The government, therefore, in the mean time consisted of these twenty-four persons. On the same day his Majesty was proclaimed in London and Westminster; and in the afternoon, the two houses of Parliament met.

"The Lord Justices named by the new King," observes Lord John Russell ('Memoirs of the Affairs of Europe,' vol. i.) "were chiefly Whigs, with the addition of those Tory peers who had appeared the most zealous for the succession. Yet, it excited some surprise to find that neither Somers, Marlborough, or Sunderland, were in the list. The reasons of these exclusions it would be difficult to assign; the spirit of the new government was, however, soon perceptible. Addison was appointed their secretary, and Bolingbroke, who had so long laboured to attain the supreme powor, and had so lately reached it, was now seen waiting with his papers at the door of the council; where many passed him with scorn, who a few days before would have given half their fortunes for his smile. Still further disgrace attended him. On the 28th of August letters arrived from the King, ordering his removal from his post; Shrewsbury, Somerset, and Cowper immediately took the seals, and locked the door of his office."

On the arrival of the King at the Hague, where he embarked for England, he named Viscount Townshend one of the Secretaries of State, with the power of selecting his own colleague. "Lord Townshend," says Lord John Russell, "who was thus raised to so conspicuous a situation, was of a Tory family; his father had been created a peer by Charles II. On first coming into the House of Lords, in 1696, he had voted with the Tories, but soon attached himself to Somers, and became a warm partisan of the Whigs. * * He had the character of being an able man of business, well versed in negotiations, an ungraceful and perplexed, but sensible speaker, rough in manners, hot in temper, too fond of bold experiments in politics, but honest and honourable in the extreme." By the advice of Horace (afterwards Lord) Walpole, younger brother of Sir Robert, Townshend named James Stanhope, Esq. (afterwards Earl Stanhope) the other Secretary of State. And soon after the King's arrival in England, the ministry was completed by the announcement of the following additional appointments:—First Lord of the Treasury, and Chancellor of the Exchequer, Lord Halifax; Lord Chancellor, Lord Cowper; President of the Council, the Earl of Nottingham; Lord Privy Seal, the Marquis of Wharton: First Lord of the Admiralty, the Earl of Orford; Lord Lieutenant of Ireland, the Earl of Sunderland; Commander-in-Chief, and Master-General of the Ordnance, the Duke of Marlborough; Lord Chamberlain, and Groom of the Stole, the Duke of Shrewsbury; Master of the Horse, the Duke of Somerset; Paymaster of the Forces Mr. (afterwards Sir Robert) Walpole; Secretary at War, William Pulteney, Esq.; Treasurer of the Navy, John Aislabie, Esq.; Lieutenant-General of the Ordnance, Thomas Earle, Esq. Stanhope, Walpole, and Earle, were also made Privy Councillors. "Out of the Privy Councillors," says Tindal, "a cabinet council was formed, consisting chiefly of the Lord Chancellor, the Duke of Marlborough, the Earls of Nottingham and Sunderland, the Lords Halifax, Townshend, Somers, and General Stanhope. All these had distinguished themselves by their professed opposition to the late measures, and the peace." In this arrangement, says Lord John Russell, "it will be seen that nearly all the principal offices, both of the ministry and of the household, were occupied by the Whigs. Shrewsbury was the only one of the late Queen's ministers who was retained by the King, and Nottingham the only decided Tory who was placed in a high office . . . . Lord Sunderland was much disappointed at being excluded from the management of affairs at home, and his father-in-law, Marlborough, was scarcely less displeased at finding himself of little weight in the administration."

The parliament, after having voted loyal addresses to the new sovereign, and a new Civil List, was on the 25th of August prorogued by the Lords Justices to the 23rd of September, but never again met. It was dissolved by proclamation on the 5th of January in the following year. The elections were carried on with great warmth, and in different counties and cities the electors went the length of delivering express instructions to their representatives. Upon the whole, a large majority of Whigs was returned. "It will appear singular," says the writer we have last quoted, "that such should have been the result of an appeal to the

 [WILLIAM CLOWES, Printer, Duke-street, Lambeth.]

people two years after a general election, at which five-sixths of the successful candidates had been Tories. The influence of the crown, and the loyal disposition of the people afford the only solution of this problem." The Tories, however, according to Tindal, still constituted about a third part of the house. Among the first acts of the new House of Commons was the adoption of measures for the prosecution of different members of the late ministry. Seizures were made of the papers of Bolingbroke, Strafford, and Prior; and on the report of a committee of secrecy, to which they had been submitted, motions were carried for the impeachment of Lord Bolingbroke and the Earl of Oxford. The former made his escape to France; the latter was sent to the Tower, where he was confined for about two years, and then tried and acquitted. Soon after, also, the Duke of Ormond was impeached, on which he withdrew to France, and joined the Pretender and Bolingbroke. In the summer of this year a change was occasioned in the constitution of the ministry by the deaths of Lord Halifax and the Duke of Shrewsbury. The former was succeeded as First Lord of the Treasury, in the first instance by the Earl of Carlisle, but soon after by Mr. Walpole, who was also appointed Chancellor of the Exchequer. Not long after, also, the Duke of Somerset was dismissed from his office of Master of the Horse, in consequence of the resentment he showed at not being accepted as bail for his son-in-law Sir William Wyndham, who had been apprehended on the charge of being concerned, with several others, in a conspiracy for bringing in the Pretender.

The rebellion in Scotland took place in the latter part of this year; and although it was speedily suppressed, the growing disaffection of which it was supposed to be the indication, gave considerable alarm to the friends of the new settlement. One of the first effects of this feeling at Court was the removal from his office of the Earl of Nottingham, who had supported in the House of Peers the petitions presented for the extension of the royal mercy to the condemned rebel lords. He was succeeded as President of the Council by the Duke of Devonshire, whose place of Steward of the Household was given to the Duke of Kent. At the same time Lord Nottingham's brother, Lord Aylesford, was removed from the Chancellorship of the Duchy of Lancaster, and his son Lord Finch, from his seat at the Treasury Board.

An important change in the constitution soon after followed, in the repeal of the triennial act, which had been extorted from King William in 1694, and the substitution of a new law, that still in force, extending the term during which a parliament may sit to seven years. There can be no doubt that the chief reason which induced the ministers to propose this innovation was their apprehension of the results of a general election in the existing state of the public mind, although the measure was supported in the course of the debates that arose upon it by many other arguments. The present parliament, indeed, had as yet sat little more than one year, and might therefore, without any new law, have been protracted for two sessions longer; but still it was apparent that even already the opponents of the ministry were looking forward to the coming dissolution, and the time that would elapse before it took place, if no alteration of the law should be made, would merely suffice to enable them to mature and perfect their preparations. That the measure was not introduced simply on any general consideration of its expediency, but that the chief object and motive of its promoters was to answer a present purpose—to meet the particular circumstances of the moment—may be conclusively inferred from the most extraordinary part of the Bill, namely, that which extended the existence even of the parliament then sitting, the members of which had been elected on what may fairly be called the express condition that they should retain their trust no longer than three years. With regard indeed to the argument which denied the power of the parliament to prolong its own existence, Lord John Russell has said, "I cannot but express my wonder that it should ever have imposed upon men of sound intellect." But notwithstanding this strong opinion, we confess that we cannot help considering this part of the Septennial Act as one of the most daring excesses ever perpetrated by any set of men in authority, and as altogether indefensible, except on the plea that it was absolutely required for the salvation of the state. If the members of the House of Commons, after having been elected to sit for three years, could thus by their own act constitute themselves a body entitled to sit for seven, it is plain that they might equally have assumed the power of sitting for their whole lives, or even that of bequeathing their seats to their descendants. We cannot recognise such an omnipotence, even in the three consenting estates of the realm, as would entitle them to deprive the body of the people of those rights which are the ultimate foundation on which the whole constitution stands.

The Septennial Bill was brought into the House of Lords on the 18th of April, 1716, by the Duke of Devonshire, whose father had been one of the chief promoters of the Triennial Act. It was supported by all the ministerial peers, but unanimously opposed by the Tories. The commitment, however, after the second reading, (the question on which there was the warmest debate), was carried by a majority of 96 to 61. On the principal division in the House of Commons there were 284 for the bill, and 162 against it, numbers answering pretty nearly to the proportions in which, according to the statement quoted above from Tindal, the members were divided into Whigs and Tories. The bill finally passed on the 26th.

From the accession of the House of Hanover, and more especially from the dismissal of the Earl of Nottingham and his friends in the beginning of the year 1716, we may consider the principle to have been established of conducting the Government, not by a balanced, or even an unequally mixed administration, but by a cabinet composed exclusively of one party. "During the reign of William III., and the greater part of that of Anne," observes Lord John Russell, "the offices of state were divided between the members of the two parties, with a view to conciliate both, and to exclude the more haughty and presumptuous leaders from acquiring a dictation over the sovereign. In the middle of the reign of Anne, the Whigs obtained something like exclusive power: and towards the end of that reign, the Tories possessed unbalanced authority; but their hesitation and misconduct totally deprived them of the confidence of the new king, and the Whigs found themselves strong enough to keep out their opponents for nearly half a century. From this time we may observe in the ministry of England, greater unity of views, a more complete confidence among the members of it, and a more uniform policy towards foreign powers."

Townshend and Walpole may now be considered as the heads of the ministry. It is to be observed, however, that the term Prime Minister had not yet come to be used in this country in any other than a sarcastic or opprobrious acceptation. Many years after this time we find Walpole in the House of Commons rejecting the title as an imputation. "Having first," he said of his opponents, in the remarkable speech in which he defended himself, in 1741, against the motion to address the king for his removal, "Having first invested me with *a kind of mock dignity, and styled me a Prime Minister*, they impute to me an unpardonable abuse of that *chimerical authority which they only have created and conferred*." At this time he had been for twenty years at the head of affairs, and with certainly as full a supremacy over his colleagues as any Premier has since enjoyed. The long domination of Walpole, however, having accustomed the country to the thing as no chimera but a substantial reality, appears to have established the name in the sense in which it is now understood. The history of the term Cabinet is exactly similar. It was first applied, as Lord Clarendon informs us, in the reign of Charles I., to a few individuals who were understood to be most in the king's confidence, and to be the chief directors of the Government. They were popularly called, by way of reproach, the *Cabinet*, or the *Junta*. The term Cabinet, however, appears to have come to be recognized as a constitutional term rather sooner than Prime Minister. Her Majesty's Cabinet, or Cabinet Council, was a common phrase in the reign of Queen Anne.

The ministry of Walpole and Townshend was, however, soon overthrown by internal jealousies and divisions. These are understood to have been principally fomented by Lord Sunderland, who, as already mentioned, bore with great impatience what he considered his exile to Ireland, and exclusion from any share in the general government. The king having gone over to Hanover in July, 1716, he was soon after followed, first, by Secretary Stanhope, and then by Sunderland, who thus found a favourable opportunity of supplanting Walpole and Townshend in the royal favour. The first result of this intrigue was an order from his Majesty for Lord Townshend to resign the seals, as Secretary

of State, accompanied with a proposal that he should go over to Ireland as Viceroy. In fact, he accepted the latter appointment about the end of January 1717. Parliament met on the 20th of February. In the beginning of April, very warm debates took place in the House of Commons, on a demand from his Majesty for a supply to enable him to avert certain dangers which were asserted to be threatened from Sweden. It was contended that the terms on which this application was made were too vague to justify the grant; and upon a division, the ministers only carried their motion by a majority of 153 to 139. Walpole did not speak upon the question, and was indeed supposed to agree in the view of the minority. The next day Mr. Secretary Stanhope brought a message from his Majesty to Lord Townshend, who had not yet left England, informing him that his services as Lord Lieutenant of Ireland would be dispensed with. On this Walpole immediately sent in his resignation; and his example was followed by Mr. Pulteney, the Secretary at War, and several others of his friends. The king is said to have been so reluctant to part with Walpole on this occasion, that he returned the seals to him no fewer than ten times.

An almost complete change of ministry followed. Mr. Stanhope was now appointed to succeed Walpole, both as First Lord of the Treasury and as Chancellor of the Exchequer; the other four members of the Treasury Board being also all changed. Lord Sunderland and Mr. Addison became the new Secretaries of State; and Mr. Craggs Secretary at War in room of Mr. Pulteney. The Duke of Bolton was appointed Lord Lieutenant of Ireland, his place of Lord Chamberlain of the Household being given to the Duke of Newcastle.

The ministry thus formed continued substantially the same for the next four years, the only changes being in individual members. In the beginning of the year 1718, the Earl of Sunderland was appointed President of the Council, the Duke of Devonshire having resigned that office some time before; and Mr. Addison, also retiring on the plea of ill health, Mr. (now Lord) Stanhope and Mr. Craggs became the two new Secretaries of State. Stanhope was succeeded in his office of First Lord of the Treasury by the Earl of Sunderland. John Aislabie, Esq. was at the same time made Chancellor of the Exchequer. Craggs was succeeded as Secretary at War, in the first instance by Viscount Castlecomer: but his Lordship had two successors before the end of the year. The place of First Lord of the Admiralty was now also filled up by the appointment of the Earl of Berkeley, in the room of the Earl of Orford, who had resigned some time before. A few weeks after Lord Cowper resigned the Great Seal, which, after having been for a short time put in commission, was given to the Chief Justice, Lord Parker, afterward created Earl of Macclesfield.

In the beginning of the year 1719, the Duke of Kingston was appointed to the office of President of the Council, which the Earl of Sunderland had till now continued to hold along with that of Secretary of State. His Grace's office of Lord Privy Seal, which he had held for somewhat more than two years, was given to Henry de Grey, Duke of Kent, and the latter was succeeded as Steward of the Household, by the Duke of Argyle. The Earl of Sunderland, who is now to be considered as Prime Minister, got himself at the same time appointed to the offices of Groom of the Stole, and first Gentleman of the Bed-chamber. This year the celebrated bill for the limitation of the peerage, which had been discussed the preceding session in the House of Lords, was defeated by the vote of the House of Commons, after a long and warm debate. The bill was supported by the ministers, but warmly opposed by Walpole and his friends, whose junction on this occasion with the Tories, produced a majority against the measure of 269 to 177.

In April, 1720, the differences which had existed for some years between the King and the Prince of Wales (afterwards George II.) were arranged, and his Majesty and his Royal Highness reconciled, principally by the good offices of the Duke of Devonshire and Mr. Walpole. This led to a partial renewal of the intercourse between the the court and the party of the former ministers. Tindal tells us that on the 24th of April, the morning after the reconciliation, the Duke of Devonshire, Earl Cowper, Lord Townshend, Mr. Walpole, Mr. Methuen, and Mr. Pulteney were admitted to kiss the King's hand, and the Duke of Devonshire carried the sword of state before the King to the royal chapel. In the following June, on the King departing to visit his dominions in Germany, Lord Townshend and the Duke of Devonshire were named as two of the noblemen appointed to act as Lords Justices during his absence, and the former was also declared Lord President of the Council, in the room of the Duke of Kingston, who was transferred to the office of Lord Privy Seal. Other changes were at the same time made, which had the effect of admitting Walpole and his friends to a share, though not to an ascendency, in the government. Walpole himself was appointed Paymaster of the Forces; Mr. Methuen, Comptroller of the Household; and the Duke of Grafton, Lord Lieutenant of Ireland.

But a much more complete ministerial revolution was at hand. This was the year of the famous South Sea scheme, the English form of the extraordinary financial delusion which had first sprung up in France, in the popular intoxication produced by the Mississippi project of the Adventurer Law. Fortunately for this country, it caught the epidemic only when it was about to commence its last stage. Although the Mississippi scheme considerably preceded the South Sea scheme in the date of its origin, the two came down nearly together. On this account the mischief sustained by England was far less extensive than that which France suffered. The Mississippi stock was at its greatest height in January, 1720; and it was about this time that the English South Sea Company commenced its operations. By the end of May, every thing had fallen into confusion in Paris: and a few months longer sufficed to produce the same result in London. In June, indeed, the frenzy here still continued to increase. "At this time," says Salmon, (Chronological Historian, vol. 2.) "the whole nation, clergy and laity, whigs and tories, churchmen and dissenters, statesmen, and even ladies, who had or could procure money for the purpose, turned stock-brokers, and entirely neglected their several professions and employments, to attend some bubble or other." Before the end of the month the 100*l.* shares of the company, for which 300*l.* had been originally subscribed, had risen to 1000*l.* By the 8th of September, however, the stock had fallen to 640; on the 9th it fell to 550; on the 19th to 400; on the 30th to 150; and soon after to 135. In the distress that ensued, "a general outcry arose," says Lord John Russell, "not only against the ministers, but the sovereign. Some of his Hanoverian counsellors, alarmed by the vehemence of public discontent, and unused to the loud voice of a free nation, advised the king to abdicate, and leave the country to its fate: and others, again, were for bringing in foreign troops, to enable him to subdue the nation which had given him his crown. At this moment Walpole came forward with a plan for the restoration of public credit, which he presented to the king, with a letter expressing his sense of the difficulties he had to encounter. To him the nation looked for its relief; he not only had the reputation of understanding finance better than any man in the kingdom, but he carried with him the weight of a large party, among whom were the Dukes of Newcastle, Grafton, and Devonshire, and many other of the principal whigs. The king and cabinet therefore willingly accepted his proposal, and better assured of his co-operation, ventured to encounter the parliament."

The parliament, after frequent prorogations, met for the dispatch of business on the 8th of December. The House of Commons immediately proceeded to inquire into the conduct of the South Sea Directors, and the other parties implicated with them in the charge of having chiefly promoted the late destructive proceedings in the money-market. The results of this investigation were such as completely to break up the existing ministry, most of the leading members of which, it was proved, had had a large share in the attempt to delude the public for their own private advantage. About the end of January, 1721, before the secret committee, to which the subject was referred, had made any report, Mr. Aislabie, the Chancellor of the Exchequer, resigned his office. It afterwards appeared that he had been one of the principal promoters of the fraud; on which a resolution was passed expelling him from the house, and ordering him to be committed to the Tower. In the beginning of February, Earl Stanhope, Secretary of State, exerted himself with so much violence in a debate in the House of Lords, in defending himself and his colleagues against an attack by the Duke of Wharton, that he burst a blood-vessel, and expired the following day. A week after,

Mr. Craggs, the other Secretary of State, died of small-pox. The reports of the Committee of Secrecy deeply implicated both Mr. Secretary Craggs and his father, Mr. James Craggs, senior, the Postmaster-General, who, fortunately for himself, also died a month after his son. It is Mr. Craggs, junior, whom Pope has so highly lauded in an epitaph inscribed on his tomb in Westminster Abbey, beginning :

> "Statesman, yet friend to truth! of soul sincere,
> In action faithful, and in honour clear!
> Who broke no promise, served no private end," &c.

Charges were also brought against the Earl of Sunderland, First Lord of the Treasury, and head of the ministry; but, by the influence of Walpole, the motion was negatived by a majority of 233 to 132. "Notwithstanding this," remarks Tindal, "it was generally thought the Secret Committee would not have accused the prime minister, if the charge had not been at least probable." Sunderland resigned his office, and died about a year afterwards. The death of Lord Sunderland, we may mention, was followed within a month by that of a still more distinguished character, his father-in-law, the great Duke of Marlborough, whose political career, however, had terminated long ago.

The several places that had in this manner become vacant were filled up as follows:—Walpole was appointed First Lord of the Treasury, and Chancellor of the Exchequer. Viscount Townshend and Lord Carteret (afterwards Earl Granville) became the two principal Secretaries of State; Lord Carleton being made President of the Council in the room of the former. These arrangements placed Walpole again at the head of the administration. "When Walpole," says Lord John Russell, "thus finally took the supreme direction of affairs, his reputation for ability stood higher than ever, but his character for integrity had somewhat suffered by his late opposition. Not only had he opposed the whig ministers on the Spanish war and every doubtful question, but had voted against the repeal of the Schism Bill, and induced the Duke of Devonshire to do the same." The Schism Act, which had been passed in the latter part of the reign of Queen Anne, and which imposed severe restrictions upon non-conformity, was repealed in December 1718, notwithstanding the most strenuous opposition of Walpole and his friends in both houses. Their object in this factious conduct no doubt was at once to obtain the applause of the more bigoted part of the nation by affecting a sympathy with popular prejudice, and to deprive their rivals of the credit of a liberal measure.

Walpole retained his place at the head of affairs for more than twenty years, being the longest period that any prime minister has ever remained in power in this country since the reign of Elizabeth. During this time, however, various changes took place in the subordinate offices in the ministry, which we shall now proceed shortly to note.

The parliament which had passed the Septennial Act was dissolved on the 10th of March, 1722, having sat for the full term allowed by the new law. The new elections were carried on with great zeal; but a decided majority of the members returned were whigs and friends of the existing administration.

In the beginning of the year 1724, the ferment that had been excited in Ireland by the affair of Wood's halfpence, induced Walpole to recall the Duke of Grafton, whom he styled "a fair weather pilot," and after withdrawing the obnoxious patent (which had been granted to Wood by his predecessor Sunderland), to send over Lord Carteret to that country as viceroy. By this act, he at the same time removed his most formidable rival from the cabinet. Carteret was succeeded as Secretary of State by the Duke of Newcastle.

In January, 1725, the impeachment of the Earl of Macclesfield, on the charge of selling the places of the Masters in Chancery (of which he was soon after convicted), made it necessary that he should resign the great seal. It was put in commission for some months, and then given with the title of Lord Keeper to Sir Peter King, afterwards made Lord Chancellor, and raised to the peerage by the title of Baron King.

In March, this year, on the death of Lord Carleton, the Duke of Devonshire was appointed President of the Council. About the same time, Lord Trevor was substituted for the Duke of Kingston as Lord Privy Seal.

George I. died in Germany on the 10th of June, 1727.

4. Reign of George II., from the 10th of June, 1727, to the 25th of October, 1760.

"The death of George I.," says Lord John Russell, "awakened the hopes of the party out of power, and men generally looked for a change of ministers. Walpole himself partook of this opinion. Upon asking his new sovereign whom he wished to draw up the declaration to the Privy Council, the king replied with great abruptness, "Compton;" and the minister quitted the room under the impression that his power was at an end. He advised his friend, Sir William Yonge, however, not to go into violent opposition, for, though he was now going out, he should probably soon come in again."

Sir Spencer Compton (afterwards Earl of Wilmington) was at this time Speaker of the House of Commons. When he received the king's commands to draw up the declaration to the Privy Council, he was obliged to ask Walpole to do it for him. The new Queen Caroline, the warm friend of Walpole, now interfered. "She pleaded his cause with her husband," continues the writer we have just quoted, "and hinted that a man who could not draw up a speech could hardly be fit for the head of a ministry. On the other hand, Compton was averse to undertake the responsibility of conducting the government. When the queen intimated to him the king's intention of placing him at the head of the treasury, and Walpole offered his support, he burst into tears, and declared himself incapable of exercising so arduous a task." In these circumstances, the continuance of Walpole at the head of affairs was a matter of course. The only change which was made on the accession of the new king in any of the great offices of state, was the substitution of the Earl of Torrington for Lord Berkeley as First Lord of the Admiralty.

Lord John Russell remarks, however, that from the accession of George II. we may date the systematic and powerful opposition by which Walpole was eventually overthrown. "It had been his anxious desire," proceeds his lordship, "to unite to his government all the followers of Lord Sunderland; and thus forming a compact body of the whole whig party, to fix on his tory opponents the name of Jacobites. Some of Lord Sunderland's friends, however, inheriting their leader's hatred, refused to coalesce with him; others saw with envy the monopoly of power in the hands of a private gentleman. In the course of opposition, these dissatisfied whigs formed a junction with the tories. The splendid abilities of some among them gave a lustre to the cause which they espoused; and young men of talents, who entered parliament unshackled, eagerly joined against a minister whose name was vulgarly associated with political corruption and national degradation."

The new reign of course brought a new parliament. The elections again ran strongly in favour of the ministry; but the numerical inferiority of the opposition in the House of Commons was in part compensated by the eminent talents of several of its members. At the head of the friends of the late Earl of Sunderland were now the two cousins Daniel and William Pulteney (the latter of whom became afterwards Earl of Bath). Both had formerly held office along with Walpole; Daniel as one of the junior Lords of the Admiralty, and William as Secretary at War. The leader of the tory party was Sir William Wyndham, of whom Speaker Onslow has said,—"He was, in my opinion, the most made for a great man of any one that I have known in this age: every thing about him seemed great." Besides these two great parties, both arrayed in opposition to the minister, there was also a small body of independent members, of whom the distinguished merchant, Sir John Barnard, one of the members for the city of London, may be considered to have been the head. Sir John Barnard was looked upon as the only match in debate for Walpole on questions in trade and finance. The minister himself is said to have been wont to speak of him as his most formidable opponent.

"Thus surrounded," says Lord John Russell, "by enemies in the House of Commons, the country, and the court, Walpole seems to have made little preparation for the defence of his power. Scarcely any rising men appeared on his side in debate; the writers whom he paid for supporting his cause were proverbially weak and inefficient. It is admitted, indeed, that in the ministry he had some able assistants; but truth itself did not make its due impression when enforced by speakers who were held up to public odium as the basest and most selfish of men. The

jealousy of dividing his power grew more and more conspicuous, and proved eventually the source of his ruin. Even with Lord Townshend, his ancient colleague and near relation, to whom he for a long time left the whole direction of foreign affairs, he was unable to maintain his connexion. In 1730, Townshend retired from office, and devoted the rest of his life to the introduction of turnip husbandry in Norfolk. Queen Caroline, by her preference of Walpole, seems to have inflamed this quarrel into a breach. Walpole himself, when asked for the causes of difference, replied, 'As long as the firm of the house was Townshend and Walpole, all did very well; but when it became Walpole and Townshend, things went wrong, and a separation ensued.'"

Lord Townshend's place of Secretary of State was given to Lord Harrington (formerly Colonel Stanhope). About the same time Lord Trevor was made President of the Council, instead of the Duke of Devonshire, and was succeeded in his office of Lord Privy Seal by Lord Wilmington, formerly Paymaster of the Forces. Lord Carteret was also recalled from Ireland, and the Duke of Dorset appointed Lord Lieutenant in his room. About the end of the year, Lord Trevor was succeeded in the Presidency of the Council by Lord Wilmington; and, in June following, the Privy Seal was given to the Duke of Devonshire.

The session of 1732-3 was rendered remarkable by the famous excise scheme, which was brought forward by Walpole on the 14th of March in the last-mentioned year. It was simply a plan for converting the duties on wine and tobacco, which had been hitherto duties of customs, into duties of excise. The ferment which this proposition excited throughout the country was almost unprecedented. In the House of Commons the first resolution moved by the minister, in preparation for the bill which he intended to bring in, was only carried by a majority of 266 to 205, after a debate which lasted till two o'clock in the morning. Some of the other divisions were still closer. On the 10th of April, the Sheriffs of London having come down to the House, accompanied by many of the most eminent merchants of the city, in two hundred carriages, Sir John Barnard moved that they should be heard by their counsel in support of their petition against the bill; and this motion was only rejected by a majority of 214 against 197. Walpole, however, now wisely determined to give up the measure. But determined to show that he was still master in the cabinet, he at the same time dismissed a number of peers, who although holding offices about the Court, had turned against him on this occasion. The staff of Lord Steward of the Household was taken from the Earl of Chesterfield. Lord Clinton was deprived of his place of Gentleman of the Bed-Chamber. The Earl of Burlington lost his Gold Staff as Captain of the Band of Pensioners. The Earl of Stair was also removed from the office of Vice-Admiral for Scotland, the Duke of Montrose from that of Keeper of the Great Seal, and the Earl of Marchmont from that of Lord Register of the same kingdom. By a more questionable exercise of the royal prerogative, Lord Clinton was likewise deprived of the Lord-Lieutenancy of Devonshire, and the Duke of Bolton and Lord Cobham, of the command of the King's Horse and the King's Horse-Guards. The Duke of Devonshire being now appointed Lord Steward of the Household, the Privy Seal was given to Viscount Lonsdale. Soon after, also, Sir Charles Wager succeeded the Earl of Torrington, as First Lord of the Admiralty. And before the end of the same year the Great Seal having been resigned by Lord King (who died a few months afterwards) Charles Talbot, Esq., was made Lord Chancellor, and soon after ennobled by the title of Baron Talbot.

The parliament was dissolved on the 18th of April, 1734, having again sat very nearly the full term of seven years. "The elections," says Lord John Russell, "were conducted with great heat. The neutrality of Great Britain, in the continental war, and the excise scheme, were popular topics for declamation; the latter especially in Scotland, where the frauds in the customs had been still more extensive than in England, and therefore combined a larger party of corrupt and dishonest men in their suppport. Even in the county of Norfolk, the two Whig candidates, Coke and Morden, were defeated by two Tories, Woodhouse and Bacon. The new parliament met on the 14th of January (1735). In a division upon the address, the opposition mustered 185 against 265. Their subsequent efforts, however, were not adequate to this beginning; but as Walpole did not wish to provoke a contest, the session was not marked by any debates of interest." In May, 1735, the Earl of Godolphin was made Lord Privy Seal in room of Viscount Lonsdale.

In 1737 died the Lord Chancellor Talbot. He was succeeded by Sir Philip Yorke, then Chief Justice of the King's Bench, afterwards Earl of Hardwicke. In September, the Duke of Devonshire was sent as Lord Lieutenant to Ireland, in the room of the Duke of Dorset. On the 20th of November died Walpole's great patroness, Queen Caroline; but this event did not deprive the minister of any portion of the royal favour. On her death-bed she said to Walpole, while his Majesty was present, "I hope you will never desert the king, but continue to serve him with your usual fidelity;" and pointing to the king, she added, "I recommend his Majesty to you."

When the parliament met in February, 1735, the address proposed by the minister in the House of Commons was only carried by a majority of 28 in a house of 492 members. The point against which the opposition directed their attack, was the recent convention (called the convention of the Pardo) which had been concluded with Spain, for the settlement of the disputes arising out of the South American commerce, and which, as soon as it was known, had roused the strongest indignation in the public mind, as a pusillanimous sacrifice of the rights and the honour of the country. The violence of party now ran so high, that the opposition, upon this defeat, resolved to adopt the extraordinary course of altogether withdrawing from their attendance in parliament. Walpole, on the other hand, seeing in the near equality of the division a plain proof that the feeling of the country was against him, with his usual accommodation to circumstances, instantly changed his line of policy, and in the course of a few weeks the negotiations with Spain were broken off, and war openly declared against that power. This change induced the Tories to return to their places when the parliament met again after the prorogation, on the 15th of November. Meanwhile it deserves to be mentioned, in an account of the movement of parties, that during the absence of his opponents the minister had some trouble with what was then considered the ultra-liberal section of his own friends. He had to fight this party on a motion which they brought forward for the repeal of the Test Act, on which occasion they mustered to the number of 89, the majority against the motion being 188.

"About this time," says Lord John Russell, "the Duke of Argyle quarrelled with the minister, and openly opposed his measures. He was a man of greedy disposition and irritable temper; his discontent arose, in all probability, from personal motives; but the convention with Spain served to colour his change of politics. The opposition in the House of Lords had grown of late years very formidable. The Duke of Argyle was a declamatory, but a ready, graceful, and animated speaker; Lord Carteret was elegant, classical, and well-informed; Lord Bathurst was a practised and sensible debater; the Duke of Bedford spoke ably on questions of trade and business of detail."

From the opposition in parliament sprung up an opposition, which every day grew bolder and stronger, in the cabinet also: at its head were Lord Hardwicke and the Duke of Newcastle, both of whom, on all occasions, expressed themselves warmly in favour of the Spanish war. In April, 1740, Lord Hervey, eldest son of the Earl of Bristol, who had some years before been called up by writ to the House of Peers, was made Lord Privy Seal, in the room of the Earl of Godolphin. Lord Hervey, while a member of the House of Commons, had distinguished himself by his zeal in support of Walpole, and was now considered one of his most subservient adherents. On occasion of his promotion, the Duke of Newcastle is said to have endeavoured to prevail upon his brother, the Hon. Henry Pelham, who was Paymaster of the Forces, and Lord Hardwicke, to resign. "Walpole himself," says Lord John Russell, "was anxious to retire, but the King said to him earnestly, 'Will you desert me in my difficulties?' At another time, Newcastle complained to Walpole that he was not allowed the form of giving his opinion. Sir Robert indignantly: 'What do you mean?—the war is yours; you have the decided conduct of it; I wish you joy of it.' They parted in anger."

The parliament commenced its last session on the November, 1740; and now at length the ener

minister determined to try their strength with him in a direct attack. They seem to have counted not so much upon the reduced numbers of the ministerial party in the two houses, as upon Walpole's extreme unpopularity out of doors; and this first attempt was no doubt intended merely to effect a breach in his defences, through which they might afterwards enter and overpower him. On the 11th of February, 1741, "Mr. Sandys," says Smollett, "went up to Sir Robert Walpole in the House, and told him that on Friday next he should bring a charge against him in public. The minister seemed to be surprised at this unexpected intimation; but after a short pause, thanked him politely for this previous notice, and said he desired no favour, but fair play." On the day he had mentioned, the 13th, Mr. Sandys made his motion. "The gallery," says Lord John Russell, "was crowded long before the House met; many members secured their seats at six o'clock in the morning." In those days, however, it is to be remembered, the House used to meet at noon. The accusations of Mr. Sandys were anything but definite. The very length of Walpole's power, he said, was in itself dangerous; it was not necessary to accuse him of any specific crime; the dissatisfaction of the people was a sufficient cause for his removal. Mr. Sandys concluded with moving, "That a humble address be presented to his Majesty, that he would be graciously pleased to remove Sir Robert Walpole from his presence and councils for ever." A long debate followed, which was closed by a powerful speech from Walpole. His address made a deep impression on the House; and the motion of Mr. Sandys was negatived by the large majority of 290 against 106. A like motion, which was made the same day by Lord Carteret in the House of Lords, was supported only by 59 votes against 108.

"After this victory in parliament," says Lord John Russell, "Walpole, tired of party war, and growing inactive from age, fell into a sort of lethargy of power. . . He flattered his indolence with the belief that the opposition to his government was dispirited and dispersed: a fatal misapprehension. Many of his colleagues secretly wished his downfall. In the division in the House of Lords, several peers who had places under the government did not vote, and acquired thereby the nickname of Sneakers." In this state of things, having again sat nearly for seven years, the parliament was dissolved on the 28th of April.

The elections were carried on with extraordinary heat, and large sums of money are said to have been expended in many places by the opposition and their friends, with the Prince of Wales at their head. His Royal Highness is said to have spent 12,000*l.* in supporting Admiral Vernon and Mr. Edwyn, for Westminster, against the ministerial candidates, Sir Charles Wager and Lord Sundon, one of the Lords of the Treasury. "Pulteney and the Duchess of Marlborough," says the writer last quoted, "spent large sums in other places. Lord Falmouth carried many of the Cornish boroughs against the county; and the Duke of Argyle was equally successful in Scotland. These triumphs of opposition favoured the treachery of Walpole's colleagues in the ministry. Wilmington, in a letter to Doddington, congratulated him on his success at Weymouth, against the candidates supported by the minister; and Newcastle made clandestine overtures to Argyle."

The new parliament met on the 4th of December. "To the disgrace of the times of which we are treating," proceeds Lord John Russell, "the warmest party contests took place on the decision of disputed elections; and that which ought to have been a question of justice, of law, and of fact, was made an opportunity of trying the strength of the contending parties in the state. The minister, on the one hand, was heard to declare, that no quarter should be given in elections; on the opposition side, it was esteemed infamous in any of their party to desert a committee for deciding disputed returns. The first trial of strength took place on the return for Bossiney. The party favoured by the minister carried it only by 6, the majority being 222 and the minority 216. The nomination of a chairman of the committee [illegible] elections was carried in favour of Dr. Lee, against Giles the [illegible] Lord of the Treasury, by 242 against 238."

"that Walpole could no longer retain his power. Every effort to recover his lost majority failed of success; the followers of victory hastened over day by day to the other camp. He could not prevail on any one to stand for Westminster in the court interest. He attempted vainly and weakly to pacify the prince, by prevailing on the king to offer him an unconditional pardon, and the addition of 50,000*l.* a year to his income. The prince replied that he would not hearken to this, or any other intimation of a like nature, so long as Sir Robert Walpole should continue in power."

On the 21st of January, 1742, Mr. Pulteney moved that the papers which had been presented to the House relating to the conduct of the war should be referred to a secret committee. The motion was negatived by a majority of only 3, in a house of 503 members. "On the 28th," continues Lord John Russell, "a collateral question on the Chippenham election was carried against the ministers by a majority of one. On the 2nd of February, Walpole suffered his final defeat: the main question on the Chippenham election being decided against him by 241 to 225. While the committee was in the act of dividing, Walpole beckoned Sir Edward Bayntun, the member whose return was supported by the opposition, and said to him, 'You are a young man; it may be useful to you to know the motives of those who are now voting against me.' He then pointed out to him the members of the majority, one by one, recounting the favours which he had conferred on each, and the ingratitude he had received at their hands. It is a pity that this story has not come down to us in more detail; it would have furnished a curious page in the secret history of the country. The minister finished by telling Sir Edward that he should never again sit in that house. On the following day the house adjourned, by the king's command, to the 18th." In the interim, Sir Robert Walpole was created Earl of Orford, and resigned all his employments.

[To be continued in our next.]

ERRATUM IN LAST 'COMPANION.'—Page 271, col. 2, line 6, for "leaving, at the instigation of his party the ultra Tories," read "having, at the instigation of his party, the ultra Tories."

FIRST REPORT OF THE COMMISSIONERS FOR THE REVISION AND DIGEST OF THE CRIMINAL LAW.

IN the month of July, 1833, a Commission under the Great Seal was issued, directing the five Commissioners therein named, "to digest into one Statute all the Statutes and Enactments touching crimes, and the trial and punishment thereof; and also to digest into one other Statute, all the provisions of the common or unwritten law touching the same; and to inquire and report how far it might be expedient to combine both these Statutes into one body of the Criminal Law, repealing all other statutory provisions, or how far it might be expedient to pass into a law the first-mentioned only of the said Statutes." The commissioners, in the month of June last, made their first report, which was presented to the houses of Parliament, and has been printed.

The subject of the revision of the criminal laws, both statutory and those which have their origin and authority in the common or unwritten law, has long engaged public attention; but as yet nothing beyond the consolidation of some parts of the statutory provisions of the laws relating to crimes, and a mitigation of some of the severer enactments relating to punishments, has been actually effected, or even attempted.

The present laws of this country are divided into statutory enactments, and the common or unwritten law.

The only authorities for the common law are certain treatises by eminent writers on criminal jurisprudence, which are received as authority by the Judges, such as those of Hale, Forster, &c., and the printed and manuscript decisions by courts of justice on criminal cases. These treatises and decisions are numerous, of various authority, and frequently inconsistent with each other: they are not generally accessible to the public, nor are they, in fact, wholly accessible to the practising lawyer — many judicial decisions being received as authorities which have never been printed. The different degrees of authority annexed to decisions and to the opinions of text writers, render the law in many respects uncertain. As even Judges

must be considered as imperfectly acquainted with the whole of the decisions, it must occasionally happen that an authority in point altogether escapes attention.

Subsequent decisions and acts of the Legislature have reversed many of the earlier authorities, and there being no authentic or uniform mark by which the authorities which still prevail, are to be distinguished from those which have been annulled, it often becomes difficult, after a laborious search through a multitude of books and statutes, to ascertain whether a particular principle is, or is not, in force.

It may be here observed, that although a large portion of the criminal cases are tried before the courts of quarter-session, yet in practice the decisions of these courts are rarely, if ever, received as authorities either by similar or superior courts.

The imperfections of the printed reports form another source of difficulty in ascertaining accurately what the law is.

In the best of these reports—viz., those of the decisions of the twelve or fifteen Judges, the report is generally confined to the facts of the case, and the grounds or reasons of the law are not adverted to by the reporter;—the official record does not supply this deficiency, the facts only being there stated; and even the record, considered as evidence of the facts and decision, is sometimes erroneous; as, for instance, where a pardon has been granted, by reason of the decision being wrong on a point of law, such pardon not appearing on the record. But assuming that the authorities were completely accessible, and were certain and definite, and that all the principles of the common law were to be found in the decided cases and authentic treatises, yet the inconvenience would be necessarily great of a system of law, which is to be searched for amongst, and extricated from, judicial decisions and treatises, oftentimes conflicting or doubtfully expressed.

The nicety and difficulty of this process are sufficiently proved by the experience of every lawyer: the principle and the material facts of a decided case are often confounded, (even by experienced Judges) with some fact, not material, insomuch that it occasionally happens that a case really falling within a particular principle is not decided by it, because the case in the books is distinguished by some immaterial differences.

Much of the common law, also, is founded on antiquated notions, and many of the old rules which arose from those antiquated notions have neither been wholly retained, nor wholly abandoned. The confusion and uncertainty thus occasioned need not be pointed out. The law is thereby also rendered unnecessarily intricate. If a rule of the kind in question were *totally* abolished, a single rule adapted to existing circumstances would naturally be substituted; but in consequence of the partial abolition, the ancient rule (founded on antiquated notions) continues to form a portion of the legal system, and to this rule are added a number of others, which form exceptions to it, and by which it is imperfectly adjusted to existing circumstances. The effect of this partial abrogation of rules, in producing an irrational, complex, and obscure system of laws, by means of distinctions founded on immaterial differences, is strikingly exemplified in the digest of the law of theft appended to the present report.

These inconsistencies have arisen from there being no complete system of law adapted to actual circumstances; in consequence of which, the judges, who could not directly make new laws, were compelled, by means of fictions; to extend the old ones to cases not properly embraced by them, but only related to those that were, by more or less remote analogy.

Thus far in regard to the evils arising from the existing state of the common law: we shall now notice some of the inconveniences more particularly produced by the present form of the statute law, and by the mixture of statutory provisions with the common law principles.

Generally speaking, the principles of the common law are the basis of the statutory enactments. The definitions of crimes—the nature of the punishments—and the modes of criminal procedure, have originated, for the most part, in common law principles; though most of the rules, relating to these various subjects, have from time to time been modified by acts of the Legislature. The statute law, therefore, may be now considered as a mass of corrections and additions to the common law; and without a knowledge of the latter, the terms and definitions which the statute law tacitly assumes, the language in which it is expressed, and the subjects to which it relates, are, for the most part, unintelligible.

It follows, therefore, that the actual law, with regard either to the definition of a crime, or to any of the other subjects of criminal law, lies partly in the statute and partly in the common law rules or principles. Nor is this the only inconvenience; the defects of the criminal law have only forced themselves on the notice of the Legislature successively and slowly, and the statutory supplements and corrections are therefore not contained in one, or even a few statutes; but lie dispersed through numerous acts of Parliament. The actual law, therefore, on any given subject, must almost always be gathered from a variety of sources.

Again, it often happens that the statute law with regard to a particular subject is not only dispersed through numerous statutes, but many of its enactments are contained, not in acts properly concerning the subject, but in those relating to other matters where no one would expect to find them. Much, indeed, has of late been done for the purpose of removing the inconvenience, arising from the multiplicity of the statutes, by the acts introduced by Sir R. Peel, and others. Much, however, remains to be accomplished.

From the foregoing statements, it follows that the criminal law must be nearly unknown to the great bulk of the community, and indeed can be only imperfectly known to advocates and attorneys, and to the magistrates who are called on to administer it. This inconvenience was admitted and urged by Foster and Blackstone, in the middle of the last century; but if some remedy for the evil was then desirable, the subsequent increase of decisions and statutes has made it now far more necessary. Generally speaking, it is only in extraordinary cases (as on arguments before the twelve judges) that the authorities are resorted to directly. In the ordinary administration of criminal justice, the law is commonly taken from modern treatises, which are of necessity but an imperfect index to these sources, and an imperfect exposition of the law contained in them; from these treatises magistrates in particular, (who are seldom lawyers by profession) are of necessity compelled to take the law. Indeed, so nice and difficult is the process of extricating principles from decisions, and of construing statutes, (often imperfect or conflicting,) that none but experienced lawyers are competent to its due performance.

When the varied and numerous functions of magistrates are considered, particularly in proceedings prior to commitment, or bail, it is obvious that it is of the highest importance to render the principles and provisions of the criminal law as simple and as accessible as possible.

The last evil to which we shall advert is, that the present form of the law is often an obstacle to good legislation, owing to the number of the authorities and statutes, which in many cases make it almost impossible that the whole of the existing law should be within the contemplation of the framer of a new law. Hence it often happens that the consequences of a proposed change are not sufficiently considered; and that the benefits of the removal of an evil in one department, are more than counterbalanced by the evils which the change introduces into others. Hence, also, much superfluous law-making: as it sometimes happens that the object aimed at by a change was sufficiently accomplished by the existing law, of which the Legislature was not aware, or might at least have been effectually accomplished by a slighter alteration.

The practicability of digesting the statutes is admitted by the recent consolidations of many of the criminal law statutes.

The practicability of giving the form of a statute to the rules and principles of the common law, may appear doubtful, for the following reasons:—1st, No systematic attempt to effect this object has ever been made in this country, at least by the authority of the Legislature. 2nd, These rules and principles are at present to be found only in judicial decisions, and in the opinions of text writers of authority. Before these rules and principles can be clothed with the form of a law, they must be detached or extricated from the decisions with which they are now complicated; and this is a process of such nicety and difficulty, that the rules (it may be argued) would run much risk of not being extracted correctly.

The novelty, however, of a digest is, we conceive, rather apparent than real, and though the difficulty adverted to is not to be denied, the possibility of surmounting it must be considered as admitted by the practice of the courts; for the very same process is performed by the courts, in expounding and applying the law in each case decided by them.

An authentic digest of the common law into a statute would not be essentially different from the expositions of it given in many treatises, which have not the authority of law; at least, not with reference to the question now under consideration—namely, the practicability of such a digest. For in these unauthoritative treatises (so far as they really are what they profess to be) the law is abstracted from the decided cases, and is presented in the form of rules. In the administration of justice (as before remarked) the law is commonly taken from these treatises as well by judges and other magistrates, as by advocates and attorneys. If these treatises, therefore, though compiled without authority, are correct abstracts of principles, surely these principles might be extracted and defined by persons competently instructed, and appointed for that purpose.

To this may be added, that wherever the law is administered, and is *directly* taken by the court from previously decided cases, the court performs (assuming the law to be correctly administered) the very process which is supposed to be impracticable. What, therefore, is accomplished occasionally and partially, it must be allowed, may be accomplished completely and once for all, by a digest of the entire law into a statute.

If we admit the practicability of a digest of the statutes and of the common law, there can be little question that such digest ought to be a joint one of the two heads of law, not two separate digests, the one of the written, and the other of the unwritten law.

In the administration of criminal justice, it often happens that the law applied by the court is neither exclusively a common law principle, nor exclusively a statutory provision, but a common law rule modified by a statute; and if the common and the statute law can thus be combined occasionally and partially in the administration of criminal justice, the same thing might be accomplished completely and at once, by a joint digest of the whole provisions of both.

The *expediency* of such a joint digest, supposing it executed with the requisite care and skill, follows from the statement made of the existing inconveniences. The principal advantages would be, the compression of the criminal code into one or more volumes, the contents of which might be studied and explored completely by every lawyer, and would be generally made known to the public; the removal of all doubt and difficulty as to what the principles and rules of the law were; the removal of all anomalies, and the correction of all apparent defects in the system of the law; and the exclusion of all remnants of the rules and principles founded on antiquated notions, which are now partly abolished and partly retained, and in consequence of which the law has been rendered inconsistent with respect to its grounds, and therefore obscure.

It may be argued, that the removal of these rules would amount to a change in the substance of the law, whereas a mere digest refers properly to the form only. Yet, since the grounds of these rules are now obsolete, and since the existing remnants of them are mere incumbrances, it must be obvious that no digest could be beneficially undertaken, the framers of which were not authorized to make changes to this extent.

A digest of the whole law would probably be objected to by the cautious or timid as a sweeping and perilous innovation on the existing institutions of the country. To this it may be answered, that, in fact, a digest of the existing law would not, of necessity, be accompanied by changes in its substance or effect; the appropriate object of a digest being, not to innovate on the substance of the existing law, but to render it by fit changes in its form more accessible and perspicuous. Those changes which might be found requisite in order to make the rules, which are now conflicting, consistent and harmonious, and those occasioned by clearing away the remnants of rules founded on notions now obsolete, could not, we conceive, on just grounds be objected to by any. It may here be observed that though existing rights or interests might probably, unless great caution were used, be disturbed by any digest of the laws relating to property, yet a digest of the criminal law is in no wise obnoxious to this important objection.

The change produced by the digest would not only, with the unimportant exception just noticed, be limited to the form of the law, but would also be in fact apparent, rather than real. It would not amount to the introduction of a new code; it would merely substitute a digest of the law made by the authority of the legislature, for those imperfect digests which in the administration of justice are commonly resorted to; it would be a compendium of the existing rules and enactments, excepting the comparatively few which might be purposely rejected or modified in substance. A new digest would state the existing law less incompletely and inaccurately than the treatises which are now usually resorted to in practice. If any omissions or mistatements should chance to be made, they would gradually be brought to light in the administration of criminal justice, and as discovered might easily be reported on by the judges, and from time to time corrected by acts of the legislature. In estimating the propriety of any change, such as that proposed, the question is not whether the new plan will be absolutely perfect, but whether there is a great preponderating balance of considerations in its favour, although it may be admitted that some evil or inconvenience must, of necessity, be incident to the change.

But it will probably be objected, that, inasmuch as the digest would be in the nature of a statute, it would not be applicable to any case not embraced by its express provisions, while the common law, in its present form, is applicable to every case that can possibly arise. To this it may be answered, that the common law has been created by the judicial or indirect legislation of the courts, since it lies in judicial decisions and in opinions which the courts receive as authorities; or if the common law has not been *created*, but has only been *declared*, by the courts, it is certain that these decisions, coupled with these opinions, are the only authentic exponents of it. The extent, therefore, of the common law, as authentically declared, is commensurate with the extent of these authorities. So far as these authorities reach, there *is* a common law; where they terminate, there is *not* a common law, and consequently a complete digest of the common law rules, as indicated by these authorities, would be as extensively applicable as the same common law rules in their present undigested form.

The objection proceeds on a misconception of the nature of the common law, which is really a system of law indicated by the authorities, and not the *arbitrium* or will of the courts; but if the common law be really *law*, and not a plausible name for the *arbitrium* of the judges, its provisions cannot be infinite, since a body of law, whose provisions were infinite, would not be ascertainable. The extent of the common law is commensurate with the extent of the authorities by which it is indicated, just as the extent of the statute law is commensurate with the extent of the enactments by which it is expressed. If, under pretext of administering the common law, a tribunal convicted and punished without the warrant of an authority, it would not do so agreeably to law, or at least not according to any law which was authentically declared, and which could have been previously known. The conviction, therefore, would be arbitrary. Or supposing that the decision of the court introduced a new rule, or declared for the first time a rule, the rule thus introduced would be *ex post facto*—a law which could not have been in the contemplation of the person upon whom it is brought to bear at the time when he committed the act which it declares to be a crime.

Those who make the objection in question mean to eulogise the common law, but, in truth, they libel it.

In earlier ages, this *ex post facto* legislation was, of necessity, frequent; the legislature being incapable or supine, the wants of the community would not have been provided for unless the courts of justice had thus interfered. But partly in this way, and partly by acts of the legislature, a body of law adequate to most of these wants was gradually formed, and since then *ex post facto* legislation has become comparatively infrequent. The courts now abide, for the most part, by authorities and statutes, and perhaps may be reproached with a servile adherence to the rules thus established rather than with the audacity and frequency of their *ex post facto* legislation.

ON THE ADMINISTRATIVE INSTITUTIONS OF THE ITALIAN STATES.

One great characteristic of most modern European monarchies, which distinguishes them from the former feudal ones, is civil equality, meaning equality before the law, so that persons of all classes are alike amenable to the same tribunals, are judged by the same laws, and are subject to the same penalties,—that they all bear their share of the taxation and are all admissible to the offices and employments of the state. This principle is acknowledged and acted upon in most of the Italian States; and more especially in the kingdom of Naples, in Austrian Italy, and in Tuscany. In the continental Sardinian states the nobility have retained some privileges, though greatly circumscribed; feudal jurisdictions have been long abolished; persons of all classes are tried before the same courts. With regard to penalties, the following article occurs in the Sardinian regulations:—"When the convicted criminals are noble, if their crimes be not such as to carry with them the stain of infamy *de jure et de facto* (for in that case they shall not be entitled to any consideration whatsoever), the judges, out of regard for their rank, instead of infamatory penalties, shall award them such others as are more suitable to their condition, but still proportionate to their guilt."

The island of Sardinia is the only part of Italy where feudality in its strict sense still exists; the island is divided into a number of fiefs having baronial courts for matters of inferior jurisdiction, but the higher tribunals are filled by, and administered in the name of, the king This is the only instance of feudality remaining in Italy. In the island of Sicily the feudal system continued till 1812, when the barons themselves, in parliament assembled, renounced their feudal rights, jurisdictions, and immunities; and declared that they should henceforth hold their lands as allodial, retaining however the order of inheritance by primogenture and *fidei-commissi*, which have been abolished in the continental kingdom of Naples. In December, 1816, King Ferdinand, in decreeing the union of the two kingdoms of Naples and Sicily, and their subjection to an uniform administration, confirmed by an article of that decree the abolition of feudality in Sicily.

Another feature which distinguishes several of the modern monarchies, however absolute in principle, from pure despotism, is the institution of provincial and communal assemblies which are not legislative, but deliberative bodies, and which concern themselves especially with matters of public economy, and with the finances and taxation of their respective districts. Their powers are more or less extensive in various countries. Provincial assemblies exist in most of the German states, and in Prussia particularly. In the several countries composing the Austrian empire they have long existed under the name of *provinzial-stände*, and they have been likewise introduced into Austrian Italy since 1814; they are there styled congregations, and are of two sorts—central congregations, of which one sits at Milan and the other at Venice, and provincial congregations, of which there is one in the chief town of every province. The members of these assemblies are chosen in equal numbers from among the nobles, landed proprietors, and deputies of the towns. Those of the two central congregations are selected by the sovereign out of the triple lists of candidates which are made out by the communal councils or municipalities. They retain their seat for six years, and receive a yearly salary of 2000 florins. The members of the provincial congregations were chosen in the same manner for the first time, but all subsequent elections are made by the congregations themselves on the lists presented by the communal councils: the members of the provincial congregations receive no emoluments. These assemblies concern themselves with the distribution of the taxes and other charges among the various districts and communes; they have the superintendence of the roads, bridges, and canals, and of the charitable establishments; they examine the annual budgets of the communes, and they decide upon all matters which are referred to them by the executive. The central congregations have also the right of addressing the sovereign by petition on other subjects relating to the wants and wishes of the people.

In the kingdom of Naples the powers of the provincial councils appear to be equally if not more extended. These bodies are intended both as an aid to and a check upon the intendants and sub-intendants, who are the governors of each province, and to see that those officers may not overstep the powers that are intrusted to them by the laws. The king appoints the members of the provincial councils out of the lists furnished by the municipalities or communes. A magistrate or judge may be a member of the provincial councils, but in all other cases no person can fill judicial and administrative offices at the same time. The provincial councillors are under the guarantee of the law, and cannot be brought before a court of justice without a special authorization from the king.

Of the working of these institutions we cannot speak positively, but we hear the present civil administration of the kingdom of Naples spoken of favourably, as extremely well organized and regular, and as being a great improvement on that which formerly existed. The intendants of the various provinces are appointed by the king, generally for three years, after which they are either confirmed or transferred to another province. They are generally men of superior education, and of the most respectable character. The intendant is the civil and political head of the province, and the receiver-general or financial officer is also subordinate to him. For military matters there is a commandant in every province. A sub-intendant resides in the second town of the province. Every province is subdivided into districts and communes, and every commune has its syndic and its decurioni or municipal council. A rural police is established in the country districts, and an urban police in the towns.

The kingdom of Naples, or, more properly speaking, the continental part of the kingdom of the two Sicilies, is divided into fifteen provinces, namely, Naples; Terra di Lavoro, chief town, Caserta; Principato Citra, chief town, Salerno; Principato Ultra, chief town, Avellino; Basilicata, chief town, Potenza; Capitanata, chief town, Foggia; Terra di Bari, chief town, Bari; Terra d'Otranto, chief town, Lecce; Calabria Citra, chief town, Cosenza; Calabria ultra Prima, chief town, Reggio; Calabria ultra Seconda, chief town, Catanzaro; Sannio, formerly called Contado di Molise, chief town, Campobasso; Abruzzo Citra, chief town, Chieti; Abruzzo ultra Primo, chief town, Teramo; Abruzzo, ultra Secondo, chief town, Aquila. In every chief town of a province there is a criminal court and a civil court of justice. In every district there is a judge of instruction dependent on the criminal court of the province. In every commune or village there is a justice of the peace, and likewise a *conciliatore*, chosen from among the chief proprietors, whose office is to endeavour to arrange amicably all minor disputes among his neighbours before the matter is made a subject of judicial proceedings. There are four courts of appeal, at Naples, Aquila, Trani, and Catanzaro; and, lastly, a supreme court has been established at Naples for the whole kingdom. This kingdom is the only Italian state in which the judicial proceedings, examination of witnesses, &c., are public, according to the principles of the French code of criminal instruction. The civil code is the same as the French, with a few modifications. There is also a commercial code, and there are three commercial tribunals, at Naples, Foggia, and Monteleone.

The supreme central power, both legislative and executive, resides in the king and his ministers. There are seven ministers, namely, the President, the ministers of foreign affairs, justice and ecclesiastical affairs, home department, finances, war and marine, and general police. There is besides a secretary for the affairs of Sicily.

The revenues are about twenty millions of ducats, of which one-third is derived from the *fondiaria*, or tax on real property (land and houses), the land tax being very heavy, in many instances more than 30 per cent. of the rent; another third from the indirect taxes, *i. e.* customs, octroi, monopoly of salt and tobacco, &c.; and the remaining third is made up by the stamps, registry, the revenue of the domains, post-office, lottery, &c. The expenses correspond nearly to the amount of the revenue. The heaviest item in the expenditure is that of the army, which amounts to between seven and eight millions of ducats. The budget of the minister of the interior ascends to above two millions, including half a million for public works, and nearly half a million more for charitable establishments; and that of the minister of finances, which includes the interest of the national debt, and the civil list, amounts to above six millions. The rest is absorbed by the ministries of justice and ecclesiastical affairs, foreign affairs, marine, and police. The national debt amounts to about one hundred millions of ducats, or seventeen millions sterling.

Naples is, of all the Italian states, the most completely organized after the manner of modern monarchies, such as Prussia for instance, and on the principles of civil equality, uniformity of laws, fixed forms of administration and judicial proceedings, separation of the civil and judicial powers, local councils in the provinces, and a supreme power above all in the central government. It is, however, still deficient in one great element of harmony and stability, as well as of progress, which Prussia seems to have secured, and that is a general diffusion of instruction and moral education among all classes of the people. On the subject of the general instruction in the various Italian states, we have not space to enter here, but we may refer our readers to a detailed statistical account of it in Number XVI. of the 'Journal of Education,' October, 1834.

The military force of the kingdom of the two Sicilies consists of two regiments of guards, ten regiments of infantry, four Swiss regiments, five regiments of cavalry, two of artillery, two battalions of engineers, and a strong body of gendarmes stationed in detachments over the country for the public security. The whole force may be calculated at 35,000 men.

In the continential part of the kingdom, there are 20 archbishops, 65 bishops, and nearly 4000 parishes. In the island of Sicily are 3 archbishops and 11 bishops, besides 50 abbots. The monks and friars are very numerous in Sicily; in the kingdom of Naples most of the convents which were possessed of property, were suppressed under the French, while the mendicant orders who had no property were continued. Since the Restoration several convents of monks have been re-established, and part of their former property which had not been sold, has been restored to them.

We now pass to view the country next to Naples, namely the Papal State, the government of which is in many respects peculiar to itself.

Provincial councils have been lately established by the present pope, but we are not acquainted with their powers. For ages past, however, communal councils have existed in all the towns, and also in the rural communes of the papal state, enjoying extensive powers. This institution was confirmed or rather remodelled by the late Pope Leo XII. in the regulations he published in October 1824, under the name of 'Reform of the public administration, and of the proceedings of the civil court,' the fifth chapter of which is devoted to the organization of the communes. Each town or village has a council which deliberates upon affairs of local interest, and a magistracy or local administration. The councils consist of 48, 36, 24, or 18 members, according to the number of the population: in the villages or communes of not more than one thousand souls, the council is composed of eighteen members. The councillors are selected in equal proportions from the two classes, the nobles or *notables* (meaning the chief landed proprietors), and the citizens and farmers. The office of councillor is for life, and vacancies are filled up by the councils themselves. The councils elect the head magistrate called "gonfaloniere," and six "elders" in large towns, and four or two elders only in smaller towns or villages. The elders must be chosen in equal proportions from the two classes of which the councils are formed. The choice made by the councils is laid before the delegate or governor of the province for his approbation. The gonfaloniere is renewed every year; the elders remain in office for two years. The communal councils appoint likewise to all local offices and employments; they pay the local police, the schoolmaster, and the apothecary and surgeon, who are obliged to attend the poor gratis; they assess the rates and other charges to defray the expenses. The *tabella* or budget for the ensuing year, is prepared by the gonfaloniere and the elders, and laid before the council, who approve or modify it, after which it is forwarded to the delegate of the province, who examines it, and then forwards it to the congregation called "del buon governo," at Rome, which congregation is peculiarly concerned with all municipal affairs. Having received its sanction, the *tabella* is returned to the commune and published at the beginning of the year, having then force of law, from which neither magistrates nor governors must deviate. All sales, leases, and contracts for the service of the community, are made by public auction. We have entered into these particulars, because we think that they are interesting as relating to a country of whose internal administration little is generally known. Count Tournon, who was Prefect of Rome during the French occupation, expresses, in a work he has written upon that country, the surprise he felt "at finding this municipal system in a state where people fancy that every thing is left to the will or caprice of the sovereign and his ministers;" and he asserts that the authority of the municipal councils is more extensive and more independent in the Papal State than in France. Count Tournon found also at Rome other matters more liberally managed than he had expected; for instance, on examining the system of the papal revenue, he "was struck by the fact of the equal distribution of the direct taxation (which constitutes nearly one half of the revenue), of which the clergy and the nobility have always borne their share like the humble villagers, and in proportion to their respective properties; exemptions and privileges which in other countries have engendered so much hostility against the favoured classes, have been for ages unknown to Papal Rome." The yearly sum allotted to the pope for his household and privy purse, he found to be only 127,000 dollars "a very modest sum," he observes, "for a sovereign prince."

The administration of the Papal State is in the hands of the pope and his ministers, who are all either cardinals or prelates. The word prelate, however, at Rome, does not mean a bishop, but an official servant of the pope, either in his temporal or in his spiritual capacity, and who is not necessarily a presbyter. Indeed, many prelates are not priests, although they wear the clerical dress, and have taken the minor orders: unless they have entered the sacred orders, which begin with that of sub-deacon, they can give up their office, and become again laymen. The same may be said of the *abbati*, who wear the clerical dress because they hold some employment, administrative or judicial, under the government. The body of prelates consists of from 200 to 250 individuals, who are classed in different ranks: some are attached to the person of the pope, and constitute his court; others act as secretaries of the numerous congregations or boards; and those who distinguish themselves are promoted to the higher offices either of the church or of the temporal state, as nuncios, delegates, judges of the supreme courts of justice, and to the situations of treasurer, auditor, governor of Rome, &c.

The ministers of the pope, in his capacity of temporal sovereign, are, the cardinal secretary of state, or first minister, and the cardinal camerlengo, or minister of finances: they have now added, it seems, a minister for the home department, which department was before under the superintendence of the secretary of state, and a secretary at war. The governor of Rome has the direction of the police of the capital. The principal business of the internal government, however, is transacted by Boards (*Congregazioni*), such as La Sacra Consulta, which superintends the political and civil administration of the provinces: the Apostolic Chamber, which is a treasury board; the Buon Governo, already mentioned, &c. Several of these Boards have also judicial powers vested in them.

The Papal State is divided into thirteen provinces, five of which (namely, Bologna, Ferrara, Ravenna, Forli, and Pesaro e Urbino) are called legations, the political head of each being generally a cardinal. The other eight are styled delegations, and are administered by delegates, who are mostly simple prelates, though some of them are occasionally cardinals. These eight delegations are called by the names of the principal towns, *i. e.*, Macerata e Camerino, Fermo e Ascoli, Ancona, Perugia, Spoleto e Rieti, Viterbo e Civitavecchia, Frosinone, and Benevento. The legate or delegate is the head of the political administration. He is assisted by a council of government, composed of the gonfaloniere and two elders of the town in which he resides. His assessor, who is a lawyer, acts as judge in civil matters for the chief town of the province, and in each of the other towns the respective governor exercises judicial power both in civil and criminal affairs of minor importance. In each province there is a magistrate called *pretore*, who judges civil suits in the first instance, and from whom there is an appeal to the court of the *Rota* at Rome, and the court of appeal at Bologna. In each province there is a criminal court, composed of the delegate and four assessors, which receives appeals from the sentences of the governors of the towns. Lastly, there are two high criminal courts for the whole state, the Sacra Consulta at Rome, and the court of appeal of Bologna. The proceedings in all the criminal courts take place with closed doors, and the depositions of witnesses are taken down in writing, according to the old system of cri-

minal jurisprudence. The accused is defended by the *avvocato de' poveri*, who is paid by the State, and who generally is a man of superior abilities, and enjoying high consideration. The accused, however, may provide himself with another counsel. The fiscal attorney is the public prosecutor. Pius VII., by a *motu proprio*, or ordinance, dated 1816, directed that, in all sentences in future, the judges should clearly state the grounds on which they have proceeded, and define the nature of the offence, and that no other penalty should be awarded but that which the law has fixed. Every species of torture was likewise abolished by the same pope.

The judges are appointed by the sovereign. The qualifications of a candidate are, that he be above thirty years of age, of legitimate birth, a spotless character, be a doctor of law, and that he have practised at the bar at least five years.

There is in each diocese an ecclesiastical court depending on the bishop, or archbishop, for the trial of all matters in which churchmen are concerned, and which has also jurisdiction over laymen in those cases which, by the canon law, are referred to the ecclesiastical authority.

Lastly, there are nine commercial tribunals in the various ports and principal trading towns in the Papal State, in which the French commercial code is followed.

All the above ministers, congregations, and courts, are concerned with the temporal matters of the Papal State, and are distinct from the spiritual hierarchy of the church, which is very numerous, and which administers, under the pope, the affairs of the Catholic Church. We refer those readers who may wish for more detailed information on these multifarious and intricate subjects, to the excellent work of Count Tournon, above quoted (*Etudes Statistiques sur Rome*), the only one we know of that gives a clear idea of the Papal government, and also to a comprehensive review of it which appeared in the 'Foreign Quarterly Review,' No. XXI. Jan. 1833.

From the short sketch we have given, it will appear that the administration of the Papal State, and especially the judicial branch of it, are essentially different, both in principle and in practice, from those of the kingdom of Naples. The Papal administration, however, has been considerably *modernized* of late years, not only in many matters of practical detail, but also in some essential points of principle. For instance, feudality may be considered as abolished: the few baronial governors still remaining in some fiefs which have not been suppressed, have hardly any power; they can only pronounce in civil cases of sums not exceeding ten dollars, and even in these there is appeal to the prætor of the province. The above-mentioned regulations of Leo XII., issued in October, 1824, abolished "all compulsory personal services of the vassals to the barons, all feudal tolls and duties, all monopolies of ovens and shambles, all reservations of game and fishing, all regalia under whatever denomination, and all rights of inheritance formerly reserved to the baron." With regard to those rights which may be called manorial, such as rights of pasture, or forest timber, of mills, of fees and fines, &c., which may be possessed as well by other individuals not having baronial rank, it was declared that they should continue to be held by the actual possessors as allodial property.

Another point in which the Papal administration has relaxed its former exclusiveness, is the more extensive admission of laymen (not prelates, many of whom are, as we have said, not churchmen) to official employments, though not to the higher offices.

A new civil Code for the Papal State has long been in preparation, and its publication is announced by a motu-proprio of Gregory XVI., of November last. Report speaks of some of its provisions as conceived in a liberal spirit, especially those concerning the rights of females to inheritance, from which they were once excluded.

There are in the Papal State 8 archbishops, 58 bishops, and 13 abbots. The numbers of the clergy in the city of Rome, in the year 1831, were—1432 secular priests, 1904 monks and friars, and 1375 nuns. We have no authentic statement of the number of the clergy in the whole State.

The military force of the Papal State has been much increased since 1831; it now consists of 8000 infantry, besides two Swiss regiments of two battalions each, one regiment of dragoons, one regiment of artillery, and 2300 carabineers, who do the police and patrol duty, like the gendarmes in France. There are also four provincial battalions, who are a sort of embodied militia. The expense of the military department is about ten millions of francs yearly.

We now proceed to the third state of Southern Italy,—namely, the Grand Duchy of Tuscany. The principle of administration is nearly the same as that of the kingdom of Naples, *i. e.*, civil equality. All classes, nobles and citizens, ecclesiastics and laymen, are subject to the same laws, the same taxation, and are amenable to the same tribunals. There are no exclusive privileges. The charges and offices of the state are filled indiscriminately by men of either humble or noble birth, and chiefly from the ranks of the legal profession. The country is divided for the purposes of political administration into five *compartimenti*, or provinces,—namely, Florence, Pisa, Siena, Arezzo, and Grosseto. Each of these has its provveditore, who is its political head or governor. The compartimenti are subdivided into cancellerie, and these again into communities. There are 240 communities in the whole duchy. The magistrate of each community is called gonfaloniere, as in the Roman State. The judicial authority, however, is separate from the political; the country is divided for judicial purposes into 121 districts, called Vicariati or Podesterie, with one judge in each, who decides civil affairs in the first instance. Five courts of appeal, called Ruote, sit in the chief towns of the five provinces. Lastly, a supreme council of justice at Florence revises in the last appeal sentences brought before it from the other courts. For criminal matters there is a tribunal at Florence which has jurisdiction over the whole Grand Duchy, except the district of the Maremme, and the island of Elba, for which there is a criminal court at Grosseto. The tribunal of Florence consists of fifteen judges, ten of whom sit in two bodies of five at a time, in turn, and the remaining five form a court of revision when a new trial is obtained by the advocate of the accused. If one court of five judges is proved before another court of the same number to have decided irregularly or partially, a third court of the remaining five judges hears the cause again. When a man is arrested for an alleged crime, the chancellor of the court, or the judge of the district, examines the witnesses in private, and endeavours to elicit the truth: and if he finds sufficient ground he returns a true bill against the accused. The written depositions are then examined by one of the judges of the criminal court, who, after having studied the case, reports on the same to his colleagues, who are to give the final verdict, and award the punishment. On the day of the trial, which is held in public, the prisoner is placed before the court to hear his trial read. In capital cases the prisoner may, on assigning satisfactory reasons, call for any of the witnesses and have them examined over again in his presence. After the reporting judge has read the evidence, the fiscal advocate or public accuser gives his opinion on the nature of the crime and the punishment required by the law. He is strictly forbidden from speaking in aggravation of the case, or appealing in the slightest degree to the feelings of the judges. The advocate of the accused next rises, and speaks for the defence, and he is at full liberty to use any arguments, and employ any oratorical means, in favour of his client. The fiscal advocate seldom replies, except for the purpose of correcting matters of fact. The judges then retire and give their sentence, which is read to the prisoner.

The criminal code is mild: death is only awarded for the crimes of premeditated murder, highway robbery, and house-breaking. But these are extremely rare in Tuscany. In cases of duel, if the challenged is killed, the survivor is sent to the galleys for fourteen years; but if the challenger falls, his antagonist is condemned only to seven years. Applications to the Sovereign for commutation or modification of the penalties are frequent, and often successful, except in very flagrant cases.

Of the 16,000,000 francs which constitue the revenue of Tuscany, 3,500,000 are derived from the prædial or land tax, 6,000,000 from the custom-houses, 3,500,000 from the government monopoly of salt and tobacco, 1,000,000 from the registration of deeds and contracts, 1,500,000 from the personal tax, 1,000,000 from the lottery, and the rest from the revenue of the national domains, the post-office, &c. The principal heads of expenditure are:—3,000,000 for the military department, 1,848,000 for the civil list, 11,000,000 for

the general administration, pensions, &c. The communes tax themselves separately for their local expenses. Tuscany is the only Italian state that has not a national debt. The taxes paid by each individual to the state are calculated at twelve livres, or about ten shillings, a year; and those paid for the communal expenses, at two and a half livres each. The military force of the state consists of 5,000 men.

The secular clergy consist of 3 archbishops—Florence, Pisa, and Siena; 17 bishops, 21 chapters, and 2,414 parish incumbents. Every candidate for holy orders must declare himself to have a patrimony, or income of his own, of at least thirty dollars a year. The same regulations exist in the Papal State, and we believe the requisite amount is rather higher. The archbishop of Florence has a revenue of 12,000 dollars; and the other sees are worth from 3000 to 4000 dollars a year. The canons of the various cathedrals have about 700 dollars per annum.

The regular or monastic clergy consist of 95 convents of men, 50 of which are friars of the mendicant order, and the other 45 are possessed of property; besides 67 nunneries. The total annual revenue of the convents and nunneries which hold property is about 1,500,000 livres, or 60,000*l.* sterling. Thirty years ago, before the suppression of the convents, they were possessed of a revenue of 10,000,000 livres, or about 400,000*l.* sterling. The number of monks who are proprietors is now about 1150. The number of mendicant friars who live by begging is 1400.

In Tuscany, the worship of Christian communions, not Catholic, is allowed. The Anglican church has a chapel at Leghorn, and the Lutheran church another. The Calvinists, or Swiss Protestants, have a chapel at Florence. The Greek church has likewise two churches. The Jews have several synagogues both at Florence and at Leghorn.

Here we must conclude, for the present, this sketch of the administration of the Italian States. We have passed in review the three states of Southern Italy,—namely, Naples, Rome, and Tuscany. We shall in a future number give a similar account of the North Italian States. Our sketch is necessarily imperfect, but it may serve to give a general idea of the social and political condition of the various Italian countries. Books of travels, and general geographical descriptions, seldom enter into the particulars of the internal administration; and yet that is, after all, the subject most closely connected with the welfare of the people.

TRADE, STATISTICS, &c.

Table of British and Prussian Ships laden at Memel.

British

1824	1825.	1826	1827.	1828.	1829	1830.	1831.	1832.	1833.	1834
420	665	340	539	482	468	329	285	237	200	130

Prussian.

327	239	190	174	217	254	213	219	342	352	362

The decrease of British ships at Memel, within the last few years, is attributed to the great decrease of water on the bar. The depth of water, which used formerly to be sixteen and seventeen feet, is now only about eleven and a half feet. In consequence, the British ships, which draw much more water than the shallow-built Prussian ships, cannot now afford to load in port.

Newspapers in the British American provinces.—The first newspaper established in Canada, after its possession by the English, was the 'Quebec Gazette,' in 1765. The 'Montreal Gazette' was first published in 1775. In 1810 there were five newspapers in Lower Canada, and *one* in Upper Canada; in 1830, there were thirteen in the first, and nineteen in the second. In Nova Scotia, the first newspaper was published at Halifax in 1751. In 1810 there were three in the province, all published at Halifax. In 1830, they had increased to six, one of which was published at Pictou. New Brunswick has seven newspapers, Newfoundland four, Prince Edward Island one, and Bermuda one; total, in the British American provinces, fifty-one.

Number of Explosions of Steam-boat boilers in the United States.—A Committee of the United States Congress has issued two reports on the causes of the frequent explosions of the boilers of steam-boats, with the best mode of remedying the evil. The whole number of explosions from 1816 to 1831 is ascertained to be 52; the number of killed 256; and the number of wounded 104. Of these, the following summary indicates whether the engines were *high* or *low* pressure:—

		Killed.	Wounded.
13	High pressure; Accidents . .	115	54
27	Low pressure ditto . .	95	29
12	Character of engine not known, supposed to be chiefly high pressure . .	46	21
52		256	104

The causes assigned are principally the faulty construction of boilers, and carelessness and want of skill. Legislative interference is recommended to a certain extent; but the complete cure of the evil is suggested to be left to the force of public opinion, and the operation of those influences which always grow up and control commercial speculations in an advanced state of society.

The INCOME and CHARGE on the CONSOLIDATED FUND, in the Quarters ended 5th January, 1834 and 1835.

INCOME.	Quarters ended 5th Jan. 1834	1835.
	£.	£
Customs.—Consolidated Duties	2,664,469	3,085,826
Sugar applicable to the Consolidated Fund	501,692	917,847
Total Customs	£.3,166,161	4,003,673
Excise	4,264,493	3,484,200
Stamps	1,570,112	1,555,362
Taxes	1,808,701	1,633,120
Post Office	324,000	324,000
Miscellaneous	56,973	54,250
	£.11,195,440	11,050,705
To Cash brought to this Account to replace the like sum issued, or to be issued, out of the Consolidated Fund in Ireland for Supply and other services	376,578	517,935
	£.11,572,018	11,568,640

CHARGE.	Quarters ended 5th Jan. 1834	1835.
	£	£
Permanent Debt	7,811,930	7,860,535
Terminable Annuities	482,695	686,095

POLITICAL RETROSPECT FOR JANUARY, 1835.

GREAT BRITAIN.

THE expected proclamation for the dissolution of Parliament appeared at last on the evening of Tuesday the 30th of December, having been agreed upon at a council held at Brighton the preceding day. The writs are made returnable on Thursday the 19th of February, on which day accordingly the two houses will meet, and the Commons will proceed to the election of their Speaker.

The elections for the new Parliament have been going on throughout the month, the first, that for Southwark, having taken place on Monday the 5th; and we have given in another place a Table of the results, in so far as they have been ascertained up to the time of our going to press. With a very few exceptions, all the members for England, Scotland, and Ireland, have now been returned.

In this second general election that has taken place since the passing of the Reform Act, the beneficial effect of the excellent regulations established by that measure for taking the poll have been as strikingly shown as on the former occasion. Although the passions of the opposing parties have been greatly excited, and the contests have been unusually numerous as well as severe, there has been very little rioting, and none of a serious description. Of course, even where the disposition to disturbance has been most strongly manifested, the inconvenience or apprehension has only lasted for a couple of days.

A remarkable feature of the elections has been the closeness of the contests in a great number of instances. There have not, we believe, been any double returns, but in several cases a member has been brought in by a majority of less than half a dozen votes over his opponent, and in a great many more the contending candidates have kept so near to each other throughout the polling, as to make the result a matter of doubt almost to its close. The majority in comparatively few places has been what could be called an overwhelming one.

It appears that the ministerial candidates have thrown out their opponents in counties and boroughs which for-

merly returned Whig or Radical members, to the extent of about a hundred seats. The time that will turn conjecture into certainty is now so near at hand that there is no great temptation to indulge in prophecy as to how far this accession of strength will go to answer the necessities of the new cabinet. It appears, at all events, to be the amount of what they have gained by the dissolution. Members of the administration have been defeated in various places.

We have to correct one or two misstatements in the list of new appointments which was given in our last Retrospect, partly upon the authority of the newspapers. The office of Lord Steward of the Household has, it appears, been given, not to Lord Roden, but to the Earl of Wilton, the second son of the Marquis of Westminster. It is asserted, however, by the Irish Orange press, that the appointment was offered, in the first instance, to Lord Roden, and declined by him. On the contrary, the London ministerial newspapers deny that any such offer was ever made. Mr. Blackburne, also, who was Attorney-General for Ireland under the late administration, has again accepted that office; and Mr. Serjeant Pennefather takes that of Solicitor-General. Some additional appointments to subordinate places, both in the household and in the public offices, have likewise been announced. Among these are, Lord Ernest Bruce and the Earl of Morton as Lords of the Bedchamber, and Mr. William Gregson as Under Secretary of State in the Home department. It is also understood that Lord Heytesbury (formerly Sir William A'Court) goes out as Governor-General to India. Four new peers have been created, one of whom is Sir James Scarlett, Chief Baron of the Court of Exchequer, now Lord Abinger; and another, Sir Philip Sydney, one of the sons-in-law of his Majesty, now Baron De Lisle and Dudley.

FRANCE.

On Tuesday, the 30th of December last, M. Humann, the Minister of Finance, presented the Budget for 1836. The net revenue was estimated at a sum about equal to 39,860,000*l.* sterling: the expenditure at about 40,080,000*l.* —thus leaving a deficit of 280,000*l.*

On the following day a very animated debate in the Chamber of Deputies rose out of the demand made by government of a grant for the building of a new Hall of Justice, adjoining the Chamber of Peers. The opposition took occasion not only to press the propriety of a general amnesty for all the political offenders now under judgment, or in prison, but to make a violent and direct attack on several of the ministers and their friends, for their former character and political conduct, which had tended (they said) to produce the very sins and errors of secret societies and republicanism, which they were now, as men in power, anxious to punish in others who had only been their converts or dupes. M. Odillon Barrot, the republican deputy, and M. Delamartine, the poet and Carlist, made long speeches in this sense. The debate was resumed the next day (the 31st of Dec.) with increased animation. M. Hennequin, the advocate, pleaded at great length, and with some violence for an amnesty; but the speech which made the greatest impression—a speech which our Parisian friends declare was "annihilating," "immortal," "superb"—was delivered by M. Berryer, another deputy of the legal profession, and a Carlist. Without mentioning names, he implied that M. Barthe, the ex-minister of justice, and now a peer of France, had been a violent *Carbonaro* under Louis XVIII. and Charles X., as had several other peers who were now to sit in judgment on Carbonari and the like; and that Messrs. Guizot, Thiers, Royer-Collard, Etienne, Mignet, and others, who were literary men before they became ministers or dependents on ministers, had by their books and lectures indoctrinated the men they now wish to condemn to death, in revolution and republicanism. M. Thiers, the Minister of the Interior, and M. Guizot, the Minister of Public Instruction, defended the conduct of their colleagues with great talent, and tried to reconcile what they wrote in books years ago, with what they practise and recommend now. The debate was adjourned to the 2nd of January, when it took more and more an authorly turn, becoming, therefore, as a matter of course, more violent than ever. Some members of the opposition actually sat to work in the Chamber, as if they were reviewing books in their own room for a literary journal. A certain M. Charamonde, who is described by the newspapers as being "a *new* member as well as *young* man," took M. Thiers's and M. Guizot's books out of his pocket, and began to read them to the house, asking the respective authors what they could now say to such and such passages. On his persisting in this course, he was interrupted by roars of laughter, hisses, and groans, mixed now and then with shouts of applause. The uproar was so great that the president rang his bell for silence, which he did not obtain for nearly a quarter of an hour.

At the end of this prolonged debate the ministers had a majority—but a very small one; two hundred and nine voting for, and one hundred and eighty-one against them. The trials of the political offenders will therefore be continued.

On Wednesday, the 7th of January, the message of the President of the United States reached Paris, and by its firm and hostile tone towards France, threw the government and the public mind into great excitement and wrath. We had to mention in our monthly retrospect, as far back as May, 1834, that the Chamber of Deputies annulled a formal express treaty, concluded in 1831, by the Duke de Broglie and General Sebastiani with the United States; by which treaty France was to pay a sum (mutually agreed upon, to be twenty-five millions of francs) as an indemnity for the injuries inflicted by the French, during the last war, upon American ships and commerce. The Duke de Broglie, who was then Minister of Foreign Affairs, and General Sebastiani resigned, when they found that they were outvoted on this delicate question, and could not, with all their representations, obtain the ratification of a treaty to which they had set their signatures in good faith and confidence.

The Americans were naturally irritated at this unexpected and equivocating delay of the settlement of claims which, when the treaty was signed in 1831, had been outstanding for some twenty years: and, on the recent assembling of Congress, President Jackson, in his energetic manner, alluded to the necessity of vindicating the national honour, and compelling payment from France by force of arms. It was this clause of his message that irritated the national susceptibilities of the French, who at first seemed determined to carry matters with a high hand and an uncompromising spirit. In the Chamber of Deputies, M. Humann, the Minister of Finance, spoke of the probability of the country's being forthwith engaged in a maritime war: and a day or two after, M. Thiers, the Minister of the Interior, insisted on the necessity of meeting the threatening language of the President of the United States, by the recall of the French ambassador at Washington. After a long and noisy debate this motion was carried: in consequence of which the following official article appeared in the Moniteur on the 14th of January:—

"The king has recalled M. Serrurier, his minister at Washington. The Minister of Foreign Affairs has communicated this resolution to the Minister of the United States at Paris; at the same time informing him that the passports of which, in consequence of this communication, he may stand in need, are at his disposition.

"In execution of the engagements entered into by France, the project of law relative to the American claim will be presented to-morrow to the Chamber of Deputies. A clause will be added destined to guarantee eventually those French interests which may be compromised."

On this Mr. Livingstone, the United States' Minister, immediately demanded his passports, and got ready for a journey to London. Such proceedings as these have generally been considered as equivalent to a declaration of war. It appears, however, that the French government speedily relented, and intimated to Mr. Livingstone that he was not bound to go away, and might do good to both the disputant parties by staying. A correspondence followed with Admiral de Rigny, the Minister of Foreign Affairs, and for the present the American envoy remains at Paris. On the 15th of January, the day after the announcements in the Moniteur, M. Humann went down to the Deputies, and, in the name of the government, re-submitted to their consideration and approval the treaty with America of July 4, 1831, which they rejected last year. After some talk about the dignity of France, and an attempt to have the President's Message considered in the light of an expression of personal feeling, and not as the legalised voice of the American government, he said that the treaty *must* stand—that Ja-

engagement having been entered into with the United States, the honour of France required that it should be fulfilled.

We will not speculate on the probable votes of the Chamber of Deputies, or on what will be the winding up of this very long story. Some members insist that the indemnity of twenty-five millions is too much, whilst others go so far as to say France does not owe a sous to America. The men holding these opinions do not belong to any one particular party, there being ministerialists, ultra-royalists, and ultra-liberals among them.

SPAIN.

THE victories obtained in the north by the arms of the Queen's troops on the 12th of December, were publicly announced at Madrid. It is said that the news was received with the most enthusiastic joy by the mass of the population, and that the marked Carlists, fearing some sudden ebullition on the part of the people, hid themselves, or shut themselves up in their houses. Profiting by this state of feeling the constitutionalists caused the Act of Cortes, by which Don Carlos and his heirs are for ever excluded from the Spanish throne, to be read aloud in all public places. The said battles turn out to have been less important than they were described, but they have had the good effect of encouraging the liberal party.

A Carlist conspiracy, headed by some priests, has been discovered at Madrid. On being arrested, one of these priests lost courage and betrayed all his accomplices and their plans, making the most ample disclosures. In spite of these secret plots of the clergy, which betray the weakness and despair of the Carlist faction, the country (except in its northern corner) seems to remain quiet and well satisfied with the constitutional regimé. The ministry was left in a minority on the question of the Civil List, which will therefore be slightly reduced.

A motion was made by Government to suppress the order of Jesuits which was restored by the late king. It was represented that there were 250 fathers of that order who possessed 700,000,000 of reals (de Vellon) in property, benefices, &c.

A law was also proposed to allow and facilitate the secularization, or return to the common affairs and rights of society, of the monks of all orders who may be disposed to quit the cloisters.

Hurried advances and rapid retreats—sorties—seizing of convoys, and skirmishes among the mountains, continue just as usual in the Basque provinces, in spite of the severity of the weather, but without any decisive result to either side. It appears that both Carlists and Christinos, acting up to the letter of their ferocious proclamations, shoot all the prisoners they take, and that the neat and thickly-spread villages, farm-houses, and cottages, that rendered Biscay in particular the most prosperous looking part of Spain, are falling a prey to the flames and the violence of the soldiery. Zumalacarreguy has announced successes obtained by him and his partisans on the 2nd and 3d of January, which appear to have been very insignificant. This Spanish Montrose, however, was well nigh being lost to the cause, being wounded and having a horse killed under him. Jealous and violent divisions have broke out among the Carlist chiefs, who cannot control their temper even in the presence of their absolute king. Zumalacarreguy, who has done so much in this war of posts and skirmishes, is unwilling that anybody else shall do anything.

It is said that Mina, whose bad health prevents an active prosecution of the war, is to be recalled, and succeeded by General Llauder. It should be noted, however, that Mina's ultra-liberal, and almost republican politics, render him an object of suspicion and dread to several members of the cabinet that have employed him.

Intelligence has just arrived of a military insurrection at Madrid. On the 17th of January a regiment of infantry, almost without any of its officers, rose against the established government, and seized upon a strong post. The war-cry of these insurgents was not for Don Carlos, but for the young Queen and liberty—their ostensible object being the constitution of the Cortes of 1812 for that now assembled. A collision ensued, in which Canterac, one of the Queen's captain-generals, and about half-a-dozen men on either side, were killed. The next day tranquillity was restored, and the troublesome regiment (with too much leniency) was marched off to the seat of war in the north.

PORTUGAL.

ON the 18th of December, the young queen Donna Maria went in state to the Cortes to prorogue their extraordinary sitting for the Christmas holidays. In her speech from the throne, she alluded to the happy adjustment and conclusion of her marriage with the Duke of Leuchtenberg. After mentioning the foreign relations of Portugal, which remain in *statu quo*, the great Northern Powers still withholding their resignation, she said, that the interior of the kingdom was *verging* towards tranquillity. The next clause of the speech conveyed something like a mild reproach to the members for their having lost so much time in idle, theoretic discussion, instead of attending to the real business of the state. Our newspaper correspondents say that she read the speech without any hesitation, and with a graceful, dignified ease, and a self confidence, "not to be expected from her years," had she not been born to the throne, and educated in regal habits." She was received with great enthusiasm.

On the 2nd of January, she re-opened the Cortes in person, and delivered another speech, which differed from the former in the following specific clauses:—

1. That immediate attention be paid to the new financial budget about to be presented to them, and to all those means by which revenue may be increased, and expenditure diminished.

2. That the Cortes fix, as soon as may be, the number of the civil and naval forces of the country.

3. That they pass the law settling the responsibility of ministers, and all other public servants.

This time she went to the Chambers surrounded by a very strong military escort, and large detachments of troops patrolled the streets of Lisbon, while she was there, or going and coming. A pistol shot had been heard in the front of the palace a few nights before, and it was said she had been driven to believe, that an assassin had aimed at her life.

The Duke of Leuchtenberg, on his way to Lisbon, arrived at London on the 15th of January. As he embarked at Falmouth in a steam packet on the 19th, he probably reached Portugal by the 25th.

The jewels and plate, valued at about 90,000*l*., belonging to the Infanta Donna Maria d'Assunciao, who died last year in Don Miguel's quarters at Santarem, have been divided between the young queen, Don Pedro's widow (representing her daughter, the Infanta Donna Isabel Maria) and the Infanta Donna Anna, who is married to the Marquis of Loulé. According to Don Miguel, his sister, the deceased Infanta, left the whole of the property to him, but it is held that he, as a usurper and traitor, cannot inherit. It was once thought that the value of the plate and jewels would be declared the property of the state and employed towards paying the indemnities.

A few notorious Miguelites have fallen victims to popular fury in the streets of Lisbon, since we last wrote, but these occurrences seem to excite scarcely any sensation.

A decree, the most illiberal and absurd that can well be conceived, has just been issued. It prohibits every foreigner, whether English or French, or of whatsoever nation, from opening a retail shop of any kind, in any part of Portugal!

Were it only for the sake of the good example they would afford, the government ought expressly to encourage the settling of such foreign dealers, for in no part of Europe are the shop-keepers so stupidly ignorant, careless, indolent, and insolent, as at Lisbon. This class, which must be everywhere important from its numbers, and which is so respectable and even enlightened in England, is a very fair criterion by which to judge of a nation.

UNITED STATES.

THE President's Message on the opening of the present Session of Congress, to which we have made allusion under the head of France, is in our apprehension a straightforward, manly, and statesmanlike document. We say statesmanlike, because we consider it to be pretty well understood now-a-days, that juggling, and subterfuge, and crooked

manœuvring do not constitute a great politician, and that he is the best statesman who goes by direct means to just ends. Nobody acquainted with the subject can for a moment doubt the justice of the United States' claims on France; and when Naples, and Spain, and other countries have paid, or are in the course of paying, for seizures of American ships and property, effected by the French during their conquest and usurpation of the government of those respective countries, it does seem particularly hard that France, because she has a consciousness of power, which those minor kingdoms have not, should pretend to refuse or delay compensation for measures of spoliation that have been brought home to the door of her own *de facto* and, at the time, firmly established government.

The French have not had to pay for the American ships and goods they seized or burnt, or detained in Spain and Italy, because by the laws of nations those countries themselves remained responsible for whatsoever deeds were done in them under a *de facto* government. But if they are not bound to make compensation for the mischief they did the Americans, as Spaniards or Italians, or acting in the name of a reigning (*French*) king of Spain, or a reigning (*French*) king of Naples, most assuredly they are held to pay for what they did as Frenchmen, acting under the French flag, and in the name of the Emperor of France. They have been separated from the countries in which they held a temporary dominion, and exonerated for all they committed during that dominion; but they cannot separate themselves from France. There, at least, they must stand and pay.

The injuries for which this compensation is demanded were inflicted under the government of Buonaparte, and chiefly during his obstinate efforts to enforce (for the ruin of British commerce) the Berlin and Milan decrees, and the so-called continental system. When he felt his strength declining, even Buonaparte professed to regret his seizures of American vessels, &c., and to admit that he owed a compensation, therefore, which might amount to fifteen, or even twenty millions of francs. The Americans, who have never ceased to press their claims since the restoration of the Bourbons, obtained a recognition of their justice both from Louis XVIII. and Charles X., and treated therefore with every one of the numerous French cabinets that rose and fell between the years 1815 and 1830. In the latter year they had nearly come to a final settlement with the last government of Charles X.; but the revolution of July broke out, Louis Philippe was raised to the throne, and after waiting a decent time, they had to recommence the business, with what they considered a more sensible king and a more liberal Cabinet: though, it must be remarked, the President says in his message, that Charles X. and the Polignac administration were on the point of agreeing to terms quite as liberal as those obtained afterwards (upon paper).

At last, after having represented, remonstrated, and negotiated, for nearly a quarter of a century, the Americans obtained the treaty of the 4th of July, 1831. By that treaty, France engaged to pay twenty-five millions of francs, in six annual instalments, the first instalment to be payable in February, 1833. But against this debt the French set off claims on the United States to the amount of one million five hundred thousand francs; which, on their part, the Americans agreed to pay in the same manner in six annual instalments.

The month of February, 1833, arrived and passed, as did many months after it, without any payment being made by the French government,* or any inclination shown to observe their agreement; nor was the treaty of 1831 ever produced in the Chambers until April, 1834, when it was annulled by the deputies, who positively refused payment.

"But," says President Jackson, "with the news of the refusal of the Chambers to make the appropriation were conveyed the regrets of the King, and a declaration that a national vessel should be forthwith sent out, with instructions to the French minister to give the most ample explanations of the past, and the strongest assurances for the future. After a long passage, the promised despatch vessel arrived. The pledges given by the French minister, upon receipt of his instructions, were, that as soon after the election of the new members as the charter would permit, the Legislative Chambers of France should be called together, and the proposition for an appropriation laid before them; that all the constitutional powers of the King and his Cabinet should be exerted to accomplish the object, and that the result should be made known early enough to be communicated to Congress at the commencement of the present session. Relying upon these pledges, and not doubting that the acknowledged justice of our claims, the promised exertion of the King and his Cabinet, and, above all, that sacred regard for the national faith and honour for which the French character has been so distinguished, would secure an early execution of the treaty in all its parts, I did not deem it necessary to call the attention of Congress to the subject at the last session." The message then continues: "I regret to say, that the pledges made through the minister of France have not been redeemed. The new Chambers met on the 31st of July last, and although the subject of fulfilling treaties was alluded to in the speech from the throne, no attempt was made by the King or his Cabinet to procure an appropriation to carry it into execution."

Having said, that after waiting nearly a quarter of a century (as they have done) to get the treaty, it would be absurd and degrading in the United States to wait another quarter of a century for the observance of the treaty they have at last obtained, the President concludes this subject by assuming it is an impossibility that any branch of the government can acquiesce in the refusal of the French to execute the treaty, or think of renewing pacific negotiations with the French Cabinet, and by recommending that a law be passed to authorize reprisals on French property, in case provision for the payment of the twenty-five millions be not made at Paris during the present session of the Chambers.

The whole sum which has been so long in debate, and which has now provoked threats of war, is about one million sterling; and as America recognises a debt due to France of one million five hundred thousand francs (or 60,000*l.*) the French are only called upon for the payment of nine hundred and forty thousand pounds sterling, with some interest, which is fixed in the treaty.

Another irritating circumstance connected with the treaty of 1831 is this: America agreed on her part to lower her duties on French wines; and France contracted in the same manner, to lower her duties on American long-staple cottons. As soon as the ratification of the treaty was exchanged at Washington (on the 2nd of February, 1832), America discharged her part of the engagement, and the French have continued ever since in the enjoyment of a valuable privilege: but France has not reduced her duties on American cottons, which are taxed just as they were before the treaty had an existence.

We hope, and indeed believe, that notwithstanding the anger which now excites both parties the dispute will be settled without any recourse to the logic of cannon-balls.

On every other point the President's message is most satisfactory. The negotiations with England touching the north-eastern boundary question, though not concluded, are conducted with mutual moderation and friendship. The best understanding exists with the governments of Austria, Russia, Prussia, Holland, Sweden, and Denmark. (*Belgium is not mentioned, although we were recently given to understand that a treaty of commerce had been agreed to between that new kingdom and the United States.*) Spain, in spite of her internal difficulties, has ratified the convention for the payment of American claims, and has finally resolved to recognise the independence of the South American States. On this last point the President says, "I have the great satisfaction of stating to you that in preparing the way for the restoration of harmony between those who have sprung from the same ancestors, who are allied by common interests, profess the same religion, and speak the same language, the United States have been actively instrumental. Our efforts to effect this good work will be persevered in while they are deemed useful to the parties, and our entire disinterestedness continues to be felt and understood.

All the internal affairs of the republic are declared to be in a most flattering condition. The ways and means, including a balance in hand for the present year, are stated at 32,327,623 dollars; whilst the current expenditure amounts to only 25,591,390 dollars, which leaves a surplus of 6,736,230 dollars for the use of the next year. A portion of this, however, is to be applied to the extinction of the public debt, which is wholly to disappear on the 1st of

* They dishonoured the American draft, which was made for February, 1833.

quary. But even with such claims there still will be a balance in the Treasury to the amount of 440,000 dollars.

It is formally declared that no alteration is intended in the tariff of foreign duties; and as to the great United States' Bank question, the President is as hostile as ever to that institution, denouncing it as a national scourge, and being evidently determined to do away with its existence.

CHRONICLE OF OCCURRENCES.

Dec. 27. Death of Charles Lamb, Esq., at Edmonton, in his 61st year.

29. Death of the Rev. T. R. Malthus, at Bath, after a few days' illness.

31. On the night of the last day of the late year, Dr. Schültz, who had been sentenced to five years' imprisonment in the castle of Badenhausen for a political offence, effected his escape by sawing through the iron bars of his prison-window.

Jan. 2. An Irish gentleman, of the name of Foote (brother of the late principal of the well-known firm in Dublin, Lundy Foote and Co., snuff-manufacturers,) was murdered in the most brutal manner, immediately adjacent to his own house, and in the open day. About a twelvemonth ago he had been waylaid and fired at, and was not quite recovered from the severe wounds he had then received, when he was again attacked, and his brains literally beaten out with stones. He was in his 73d year. His residence was at Rossbercon, on the Kilkenny side of New Ross, in the county of Wexford. The act is ascribed to a conspiracy against Mr. Foote, connected with land-letting.

— Three mail bags, having their contents abstracted, were found in the river at the bridge of Fermoy. The bags were those which left Cork on the 19th, for Limerick, Cahir, and Dublin, *viâ* Cashel up. A notorious mail-robber had been seen prowling in the neighbourhood of Fermoy and Rathcormack for some days past. Two of the letters have since been taken to Rathcormack, and entered at the post office there.

6. On this evening an accident of a most distressing nature occurred at the public house in Drury Lane known by the sign of the White Lion. Some men belonging to the brewhouse of Messrs. Elliott, at Pimlico, were about to deliver some butts of ale and porter at the house above mentioned, and had opened the trap for that purpose, which a respectably-dressed young man, who was coming by at the time, not perceiving, fell head-foremost into the cellar beneath, and was mortally hurt. The frequency of accidents similar to the above ought to cause some means to be devised to prevent their occurrence.

10. The editor of the 'Tribune' newspaper at Paris, was condemned by the Cour d'Assises to six months' imprisonment, and a fine of two thousand francs, for publishing an article translated from a London evening paper, reflecting severely on Louis Philippe.

11. A fine young man, the son of the proposer of Mr. Augerstein, one of the successful candidates for Greenwich, died in consequence, it is said, of the rupture of a blood-vessel, owing to the excitement of the contest. He had been on the hustings during the previous day, in perfect health and spirits.

— The Duke of Leuchtenberg, husband of the Queen of Portugal, landed at Gravesend, accompanied by Lord Adolphus Fitzclarence and Captain Freemantle, who attended him from Ostend at the command of the King. The Duke, who has assumed the title of Prince Augustus of Portugal, proceeded to London with his suite, and has since left this country for Portugal.

— Sir William Taunton, one of the justices of the Court of King's Bench, and Recorder of Oxford, died on the evening of this day. His death was sudden and unexpected, arising from an effusion of water on the brain, proceeding from disease of the heart. He was in his sixty-fourth year. The vacancy on the bench thus occasioned has since been filled up by the appointment of Mr. Sergeant Coleridge.

12. This being the first day of term, the judges and dignitaries of the law breakfasted with the Lord Chancellor at Lincoln's Inn Hall, and afterwards accompanied him in procession to Westminster. When the judges had taken their seats in the different courts, fourteen gentlemen were called within the bar, having received the rank of King's Counsel.

The unhappy tithe affray in the county of Cork, mentioned in the last 'Chronicle of Occurrences,' has excited a good deal of attention during the month. An inquest has been held, and, after a protracted investigation, thirteen of the jury agreed in a verdict of *wilful murder* against the Rev. Archdeacon Ryder, and Captains Bagley and Collis; two were for *manslaughter*, and eight for *justifiable homicide*. The Rev. Archdeacon Ryder, at whose instance the military were employed to enforce the collection of his tithe, and Captains Bagley and Collis, have been admitted to bail, each in 100*l*., and two sureties in 50*l*. each. The counsel for these gentlemen have intimated an intention of bringing the verdict of the jury into the Court of King's Bench.

Two of the crew of the Orestes have been lately murdered at Alicant by some Spaniards—a gunner from the Excellent, and a [illegible] from Portsmouth. They were both very drunk some time in the day when last seen; and they were both found together weltering in their blood at seven the next morning, in one of the most frequented parts of Alicant. Commander Codrington adds, that such is the state of the police and the laws there, that he can find no clue to discover the murderers.

It is stated in the newspapers that no fewer than sixty-three admirals and seventy-eight generals have paid the debt of nature within the last four years.

Letters have been received at Lloyd's, dated October 25th, from Port Louis, Mauritius, giving the particulars of the destruction of the ship Earl of Eldon by fire, and the extraordinary preservation of the crew. It appears that on the passage from Bombay to London the vessel caught fire, on the 27th September, (in consequence of some cotton igniting,) in lat. 9° 50′ south, and long. 77° 22′ east. The crew and passengers were obliged to abandon the ship, and take to the boats; and in this situation, with very little saved from the vessel, they remained for thirteen days, until they reached the Isle of Rodriguez, on the 10th October, having sailed upwards of a thousand miles. There were nine passengers and an infant of four months old, which, with the crew, made thirty-five individuals.

The Elections.—The first members returned to the new Parliament were Mr. D. W. Harvey and Mr. John Humphreys, who were elected for the borough of Southwark on Monday the 5th of January. On the same day the nomination of the candidates for the City of London took place, for Marylebone and Westminster on Tuesday, on Wednesday for the Tower Hamlets, Finsbury and Lambeth, and for Middlesex on the 13th. All the metropolitan districts, except Southwark, were keenly contested, but no serious case of riot or disturbance occurred; the only charges brought before the police magistrates being at the instance of a number of informers, who seized the poor men employed in carrying placards, for violations of what are termed the "Printers' Acts," by which a penalty of five pounds is imposed for printing, publishing, circulating, or otherwise distributing any paper which has not the printer's name, whether the individual do it for hire or gratis. In most instances the fines were paid by the committees of the different candidates, the informers receiving a moiety.

A friend of Captain Ryder Burton, the unsuccessful candidate for the Tower Hamlets, who was present during some of the investigations at the police office at Worship Street, relative to the proceedings connected with the apprehension of the placard-bearers, in reply to a question from the magistrate, stated that the Captain's election expenses were about 2 500*l*.

The Liverpool election was very keenly contested. It is stated in the newspapers that the last hour of the poll was a most momentous one. "In every direction were seen flying vans, flies, gigs, &c., and it was said that the price of a vote rose from 15*l*. to 25*l*."

Some of the contested elections ran very close, as may be seen by a reference to the table given in another place, the majorities being extremely small. In one or two instances a single vote turned the scale.

Unfortunately, both at Stockport and Cork, the elections have not passed over without serious breaches of the peace. At Stockport a lawless mob broke the windows of a number of houses, entered and kept possession of a tavern, in which they committed considerable damage, and were not got under without the assistance of the military.

In the course of the nomination of the candidates for the City of Dublin, Mr. Ruthven gave the lie direct to the Lord Mayor (Perrin) respecting a statement which had been published with the name of the latter attached to it, that he did not possess the requisite qualification for a member of Parliament. The Lord Mayor, on reaching home, appointed the city treasurer, Sir J. K. James, his *locum tenens*, and sent a challenge to Mr. Ruthven, which was accepted, and both parties fired at each other *twice*, without either receiving injury. Mr. Ruthven still refusing to apologise, the Lord Mayor was then led from the ground by his second. The election for the City of Dublin was conducted with more than ordinary violence and excitement.

FOREIGN AND COLONIAL TRADE OF FRANCE.

HAVING procured a copy of the statement presented a few weeks ago by the French government to the Legislative Chambers, exhibiting the details of the Foreign and Colonial Import and Export trade of France during the year 1833, we have been induced to submit it to a careful examination, and to compare it with the like document presented to the Chambers in each of the four preceding years: and we have drawn out an abstract of the whole, which we think may be useful to the trading community of this country.

The statements from which our tables are compiled are exceedingly detailed and minute, and must be found eminently useful to persons engaged in the pursuits of commerce in France. They exhibit, under almost every form that can be desired or imagined, the trade in, and consumption of, every article of merchandise, particularising the quantities, as well as value, and exhibiting the various countries whence and to which the trade has been carried on. The various articles of merchandise are also classed according to their natural divisions of vegetable and mineral, and distinctions are drawn between such as form the raw materials of manufacture, and others which are fit for use in their natural state, or which are already manufactured. The only desirable addition which we could suggest to the statements would be a detail of the commerce of France with each particular country. An abstract of this information is indeed given, but this abstract furnishes only the aggregate value of the export and import trade, without indicating, as we could wish, the nature, quantities, and value of each article of merchandise which has been so exchanged. The materials necessary for constructing such tables as we have here pointed out are indeed presented in the volumes before us, but from the manner in which they are scattered over nearly 300 folio pages, in each volume, it would be a very laborious task to extract and tabularize the particulars.

The limited space which we can assign to the subject in our present Number, will not allow of our bringing forward all the various points which have suggested themselves during our examination of these interesting volumes. We must, on the present occasion, limit the few remarks we can make to such branches of the subject as may be supposed to have the greatest interest for readers on this side of the channel.

The first thing which strikes us is the very large proportion of foreign trade which is carried on at the various ports of France in foreign bottoms. It will be seen by reference to our abstract, that the average proportion which foreign ships have borne to the whole tonnage employed, including ships under the national flag, during the five years that we have taken, is more than 63 per cent. During the same years the foreign ships employed in the foreign and colonial trade of our own country, have, on the average, borne no greater proportion than 24½ per cent. of the whole tonnage employed. The value of the goods imported into France in ships of that country is on the other hand seen to exceed the value of the importation in foreign bottoms. This arises from the greater comparative value of the produce brought from the French colonies, the whole of which trade, as well as the fisheries, is confined to the national flag. Besides this, the whole of the India trade is carried on in French bottoms.

Judging from the abstract which we have made, it appears that the trade of France is in a satisfactory state of progression. In 1829 the total imports and exports were of the value of 616,353,907 francs, and 667,818,646 francs respectively. In 1833 they reached 693,275,752 francs, and 766,316,312 francs, being an increase of 12½ per cent. in the value of imports, and of 25 per cent. in that of exports.

We have not the means of forming any correct estimate of the total value of British trade during the same period. The only method of computation employed by our Custom-house for estimating the value of foreign and colonial merchandise imported and exported, is by the employment of a scale of rates established 150 years ago, under the name of official value. This scale, from the peculiar plan pursued, of affixing different values to the same articles when imported or exported, could never have afforded any correct results; but besides this, the scales adopted for the three divisions of the kingdom, all vary from one another, and the whole plan seems to have been admirably contrived for mystifying a matter which our neighbours the French have shown to be very simple and easy of elucidation. Their plan is to make at short intervals new valuations of each article, which shall bear relation to the existing state of the markets; and although it would be absurd to suppose that any account thus stated could be perfectly accurate, since there are very great differences in the quality of different parcels of the same goods, yet if the rates are adopted upon a fair medium scale, it is probable that the errors committed one way may compensate those existing in an opposite direction, and thus the result may, on the whole, be sufficiently accurate to answer all practical purposes. In every case the rate of valuation employed is given in the tables.

In addition to the general abstract to which our foregoing remarks have reference, we have prepared another table, showing the value of the trade carried on during the same five years between France and the United Kingdom, and her Eastern dependencies. The thing that strikes us as being most remarkable, from a view of this abstract, is the great disproportion which it exhibits between the value of the imports and that of the exports. According to the old method of estimating the benefits of trade, this statement would make it appear that our commercial intercourse with France must be in a high degree ruinous to England, the value of our imports from that country being nearly double that of the goods which she takes from us in return. It could not be necessary in the present day, under any circumstances, to be at the trouble of showing the fallacy of such an opinion; but we are convinced that the difference which we have here noticed has in reality no existence, and that France does actually take from us to the full amount of all the merchandise which she supplies to England.

By the Custom-house regulations of that country, the[illegible]on, are several articles of which France has need, which[illegible]ent. But will not receive direct from England, although from [illegible]le, notwith[illegible]

standing his resignation of office, still to retain a considerable influence in the direction of affairs, was the confidence of the king, which was not withdrawn from him, but continued to be manifested on the part of his Majesty by an almost avowed preference for the advice of the retired minister to that of any of his other counsellors.

Smollett, or the writer of the continuation of Tindal which goes by his name, has given in a few words the aim and character of the course which Walpole adopted in the circumstances in which he was now placed. "At no time of his life," says this writer, "did he acquit himself with such prudential policy as he now displayed. He found means to separate the parts that composed the opposition, and to transfer the popular odium from himself to those who had professed themselves his keenest adversaries." Lord John Russell says, "Out of care for his country, he desired that the government should be conducted by a Whig ministry. Out of concern for himself he sought to blunt the animosity which the opposition leaders entertained personally against him." In order to accomplish these objects he first threw out lures to the Tories, so as to raise in them the highest expectations; he then, by means of his colleagues, opened a negotiation with Pulteney. When this negotiation began we are not informed: the first intimation we have of it is a message from the Duke of Newcastle to Mr. Pulteney, proposing to meet him privately at the house of his secretary, Mr. Stone.* Pulteney declined a private meeting, but offered to receive the Duke at his own house. Newcastle went, accompanied by Lord Hardwicke. He found Pulteney with Lord Carteret by his side. Newcastle commenced the conference by stating, that the king, being convinced that Sir Robert Walpole was no longer supported by a majority in the House of Commons, had commanded them to offer the places that minister possessed to Mr Pulteney, on condition only that the ex-minister should not be prosecuted. Pulteney replied that he could not make such a condition; that whatever his own inclination might be, he could not answer for his friends: that parties, like snakes, moved by their tales; that he would be no screen: but that if the king desired to open any treaty with him, he would go publicly to St. James's. Before they parted some negus was brought in, and Newcastle drank, "To our happier meeting." Pulteney replied,

> "If we do meet again, why, we shall smile:
> If not, why then this meeting was well made."

A report of this conference, which was held without any concealment, soon reached the public, and great blame was attached to Pulteney and Carteret for beginning to treat without consulting the great body of the opposition. The *boy patriots*, as Walpole used to call them, namely, Pitt, the Grenvilles, and Lyttleton, secretly offered, through Colonel Selwyn, to secure the minister from prosecution, and answered for the concurrence of the Prince; but Walpole coolly denied the proposal. In the meanwhile, the prospect of the sun shining over a new hemisphere, hatched a swarm of embryo projects and theories of amendments. Some called for triennial parliaments, others for annual: some for a pension bill, some for a reduction of the civil list. One set of people were for taking away the disposal of all employments from the crown, another for making them incompatible with a seat in Parliament. Here a knot of politicians were for rendering the officers of the army independent of the crown; there, a more popular improver was for doing away with regular troops altogether..... The variety of these projects, many of them totally inconsistent with the constitution, alarmed the Whig principles of Pulteney, and made him the more anxious to act what he deemed, perhaps, the glorious and disinterested part of mediator between king and people. Walpole, on the other hand, was eager to secure the chief power in the future ministry to one whose enmity he did not fear. By his advice, it appears, the king sent a private message to Pulteney, requesting that, if he did not choose to place himself at the head of the Treasury, he would let Lord Wilmington (Sir Spencer Compton) slide into that post. Carteret, who desired the place for himself, objected to this arrangement; but Pulteney having obliged him to consent, Walpole was fully satisfied. His great object had been to lure Pulteney to the palace without his party; and when the king, conquering his aversion, allowed this to be done, he said to his son Horace, making a motion with his hand, as if locking a door, 'I have turned the key of the closet upon him.'

The result was, that after another conference an arrangement was made, by which Pulteney, without expressly pledging himself to secure Walpole from prosecution, was allowed to name a new ministry. Thus empowered, he declined holding any office himself, but asked only a seat in the Cabinet, and the promise of an earldom whenever he might choose to go to the Upper House. Of the existing ministry also, he removed only those members who were known as the Walpole party. Thus, he continued Lord Hardwicke as Chancellor, the Duke of Newcastle as one of the Secretaries of State, the Earl of Cholmondeley as Chancellor of the Duchy of Lancaster, Lord Monson as First Lord of Trade, Sir William Yonge as Secretary at War, Mr. Pelham as Paymaster-General, Sir Dudley Ryder as Attorney-General, &c. The officers of the Household, likewise, almost without exception, retained their places. The principal changes were made in the Boards of Treasury and Admiralty. Of the former the Earl of Wilmington was named the First Lord; the other four commissioners being also all new men. One of these was Mr. Sandys, who was at the same time appointed to the office of Chancellor of the Exchequer, which Walpole had held along with that of First Lord of the Treasury. The chief place at the Board of Admiralty, from which Sir Charles Wager was removed, was given to the Earl of Winchilsea, all the junior lords being also changed. Lord Carteret was made the other Secretary of State in the room of Lord Harrington, who was created an Earl, and transferred to the office of President of the Council, formerly held by Lord Wilmington. Earl Gower was made Lord Privy Seal in the room of Lord Hervey, and the Marquis of Tweeddale was also admitted into the Cabinet as Principal Secretary of State for Scotland. The principal persons excluded, therefore, were Walpole, Lord Hervey, Lord Monson, and Lord Cholmondeley; and those admitted in their places, besides Pulteney himself, were Lord Gower, Lord Winchilsea, Mr. Sandys, Lord Carteret, and the Marquis of Tweeddale.

Almost the only representative which the Tory party had in the new government was Lord Gower.† In the course of a few months also, Lord Bathurst, a Jacobite, was made Captain of the Band of Gentlemen Pensioners, in the room of the Duke of Bolton. This almost entire exclusion of one of the most powerful sections of the opposition which had driven out the late ministry, immediately produced a schism in that body. At a great meeting held at the Fountain Tavern, on the 12th of February, the day after Walpole's resignation—which was attended by nearly 300 members of the two Houses—a violent debate took place, and the Duke of Argyle declared himself in opposition to the new government, on the ground of the unjust exclusion of the Tories. His Grace, however, afterwards accepted the office of Master-General of the Ordnance, and was at the same time made Colonel of His Majesty's royal regiment of Horse-Guards, a Field-Marshal, and Commander-in-Chief of all the forces in Great Britain. But the king having refused to admit Sir John Hynde Cotton (whose accession the Duke had made the condition of his own acceptance of office) to a place in the government, his Grace, in less than a month, resigned all his employments, and withdrew again into opposition.

But the Tories were not the only excluded section of the late opposition. That party of the Whigs, the most distinguished members of which were Mr. Pitt (afterwards so celebrated both under that name and as Earl of Chatham), Mr. George Lyttleton (afterwards Lord Lyttleton), and Mr. Richard Grenville (afterwards Earl Temple), was also entirely passed over. The reason of this is understood to have been a coldness that existed between Pulteney's friend Carteret, and Richard Temple, Viscount Cobham, with whom Lyttleton, Grenville, and Pitt were closely connected. The two former had married two daughters of Lord Cobham, and Pitt's elder brother was married to a sister of Lyttleton. But the king had also conceived a strong dislike to Pitt, which was with difficulty overcome many years after this time.

The only thing that in these circumstances held the old alliance of the Patriots together, was their still unsatisfied

* That is, the Duke's secretary, Mr. Andrew Stone.

* Lord John Russell ('Memoirs of the Affairs of Europe,' ii., 463,) says, that Sir John Hynde Cotton (who was a decided Jacobite) was made a member of the new Board of Admiralty; but this, we believe, is a mistake.

pursuit of Walpole; nor did even that hold them together either entirely or very long. On the 9th of March Lord Limerick moved in the House of Commons the appointment of a secret committee to inquire into the conduct of affairs for the last twenty years. The motion was strongly supported by Mr. Pitt and others, but opposed by Mr. Pelham, the principal member of the government who spoke. Pulteney was absent in consequence of the illness of his daughter, who soon after died. The motion was lost only by two votes in a House consisting of 486 members. On the 23rd of the same month it was again brought forward in a somewhat different form, the proposed inquiry being limited to the last ten years: and this time it was carried by a majority of 252 to 245. Although the Secret Committee, however, sat for some time, their deliberations produced no result, the inquiry being effectually stopped at its commencement by the refusal of the House of Lords to concur in a bill which had been sent up to them from the Commons for granting an indemnity to the witnesses. Walpole, who lived for about three years after his retirement from office, was not further molested.

Their single common object thus abandoned, or removed out of their reach, the coalition which had originally been formed on the principle of hostility to the government of the late minister, entirely broke up, and the grand overruling distinction of ins and outs again came into play. The Prince of Wales himself, who had at first given his approval to the new arrangements, and been formally reconciled to the king, after a short time openly resumed his place at the head of the opposition. Meanwhile Pulteney was forced to take out his patent as Earl of Bath, and was thus for ever removed from the House of Commons. The king is said to have insisted upon this at the instigation of Walpole, who in this way effected the complete political extinction of the most formidable of his opponents. Pulteney became Earl of Bath—and as such, a mere cypher in the state, and the object of general contempt—in July, 1742, a few months after the close of the session, the commencement of which had seen him at the head of the victorious opposition, and the most popular man in England.

The death of Lord Wilmington, the nominal head of the Cabinet, in July, 1743, gave occasion to some new changes. Lord Carteret, who was personally a favourite with the king, exerted his influence to get Pulteney placed at the head of the Treasury Board, but the advice of Walpole prevailed over that of his old rival, and the office was given to Mr. Pelham, who also, at the same time, was appointed Chancellor of the Exchequer, from which post Sandys (made a peer by the title of Baron Sandys) was dismissed to that of Cofferer of the Household. Mr. Thomas Winnington, a man of considerable ability, succeeded Mr. Pelham as Paymaster-General.

In December following, a few days after the assembling of Parliament, Lord Gower resigned the Privy Seal, and was succeeded by Earl Cholmondeley. Lord Gower alleged as the reason of his secession the exclusion of the Tories from any share in the government. About the same time Lord Cobham, who a short while before had accepted the appointment of Commander of the Forces in England, finding that no members of the party which he headed were to be brought in, also resigned.

The ministry was now in a state of the greatest distraction and weakness. Lord Carteret, presuming upon the king's favour, which he had acquired by his subserviency to his Majesty's Hanoverian partialities and fondness for interfering in the politics and military operations of the continental powers, treated his colleagues with the most unmeasured insolence. At the same time he both stood almost alone in the Cabinet, and was of all its members the most unpopular throughout the country. The employment of the Hanoverian troops in the war with France—a measure to which Carteret, in order to humour the king, had attached himself with particular ardour—was made the chief subject of the invectives of the opposition in the House of Commons. Although the address had been carried in that House by a majority of 278 to 149 (all Walpole's friends ranging themselves with the ministry), the opposition, animated by the support which it received out of doors, decidedly increased in strength as the session advanced. It is said that the operations of this body were now directed by a secret committee, or anti-ministerial Cabinet, as it might be called, composed of the following six members:—Mr. George Bubb Dodington (afterwards Lord Melcombe), the author of the well-known Diary; Mr. W. Pitt; Sir John Hinde Cotton; Sir Watkin W. Wynn, another Jacobite; Mr. Edmund Waller; and Mr. G. Lyttleton.

The signal for the actual commencement of hostilities between France and England was at length given by a formal declaration of war on the part of the former power on the 4th of March, 1744. It was followed by a similar declaration from his Britannic Majesty on the 29th of the same month. The success which attended the arms of the enemy in the ensuing campaign in Flanders, under the conduct of Marshal Saxe, did not make the position of the English minister easier or more secure. It tended, however, to bring matters more speedily to a crisis, by increasing the unpopularity of Carteret, who was looked upon as both the author and the chief manager of the war. "Lord Carteret, now Lord Granville,*" says Lord John Russell, "was in many respects the very reverse of Lord Oxford. With all the accomplishments of a scholar, and the lofty views of a liberal and enlarged mind, he was vain and presumptuous; had no definite plan, and often offended his colleagues by the haughtiness of his manner. The Duke of Newcastle, on the other hand, was timid, cringing, and irresolute; so that it was well said of the two ministers, that Carteret made a difficulty of every difficulty, and Newcastle made a difficulty of every trifle. The major part of the administration, alarmed at Carteret's prodigality, began to check his ambitious measures, and he was often outvoted in the Cabinet by four to one. Provoked at this situation, he declared that if his colleagues chose to take the government upon them, they might, but that, if they would not, he would do it. Both parties began to look for other aid. In this attempt Lord Granville failed, and the Pelhams were successful. Lord Hardwicke, the Chancellor, drew up a strong memorial representing the ill-conduct of foreign affairs. This memorial, after being approved by the Pelhams, the Dukes of Devonshire,† Dorset,‡ Argyle, and Montagu,§ was presented to the king, who, upon reading it, showed by his countenance the displeasure it had produced. Having no remedy, however, he at length signified to the Chancellor that Lord Granville should resign."

The dismissal of Lord Granville took place on the 23rd of November. In adopting the course which he did upon this occasion the king is said again to have acted by the advice of Lord Oxford. Arrangements had been previously made by the insurgent party in the cabinet with the different leaders of the opposition, and a new ministry was immediately formed, which, as professing to be composed of an union of all parties, received the name of the *Broad Bottom Ministry*. From this all-comprehensive arrangement, however, the adherents of Lords Bath and Granville were, of course, altogether excluded. Lord Hardwicke remained Chancellor; Mr. Pelham, First Lord of the Treasury and Chancellor of the Exchequer; and the Duke of Newcastle, Secretary of State. Lord Harrington was made the other Secretary in the room of Granville. Harrington was succeeded in his office of Lord President of the Council by the Duke of Dorset. Lord Gower returned to his former office of Lord Privy Seal, from which Lord Cholmondeley was dismissed, and the Duke of Bolton became First Lord of the Admiralty in the room of the Earl of Winchelsea. Mr. Lyttleton obtained a seat at the Treasury Board, and Mr. Grenville was made one of the Junior Lords of the Admiralty. Dodington was appointed Treasurer of the Navy; Waller, Cofferer of the Household; and Sir J. H. Cotton, Treasurer of the King's Chamber. Pitt was also promised a place as soon as the king's aversion could be overcome.

"This general coalition," observes Lord John Russell, "smoothed the great sea of parliamentary debate; and the next session is remarkable for producing scarcely a single division. Yet the conduct of the new ministry did not essentially differ from that of Lord Carteret. It will be remembered, that one of the reproaches made against the fallen minister was the preference shown to the Hanoverian troops: motions had been made directly recommending their dismissal, and had been supported by invectives of

* He had succeeded to the title of Earl Granville on the death of his mother.

§ His Grace retained the office of Master-General of the Ordnance, which he had held under Walpole.

unusual asperity. The new ministry, to preserve their consistency, dismissed the Hanoverian troops, but gave an increased subsidy to the Queen of Hungary, which enabled her to take them into her pay: the troops were retained in the camp of the allies; and when the popular cry grew faint, they were again paid to the increased number of 22,000, from the British treasury." It may be added, that even Pitt, who had hitherto been the most vehement declaimer in the House of Commons against the sending of troops to the continent, now strenuously supported the vigorous prosecution of the war. But all this inconsistency on the part of the patriots was overlooked by the public in the popular triumph that was felt to have been gained by the dismissal of Granville. That ex-minister, however, still enjoyed the chief confidence of the king, by whom he was secretly consulted upon all matters of importance, while the actual members of the cabinet were treated with coldness and incivility.

In August, 1745, the rebellion suddenly broke out in Scotland. In the beginning of the following year, while this attempt remained still unsubdued, the king and his ministry thought it the proper time to try which was the strongest. It was well known that his Majesty was anxious to bring back Lord Granville; but the first move seems to have been made by the Duke of Newcastle who proposed the admission into the government of Mr. Pitt as Secretary at War. The insinuations of Pulteney are said to have been employed to strengthen the royal aversion to this demand. In the difficulty to which he was reduced, the king attempted to prevail upon Lord Harrington to desert his party, in the notion that with his lordship's assistance a new cabinet might be formed with Bath and Granville at its head. Harrington, however, not only steadily refused to aid in this scheme, but communicated what had passed to his colleagues, and he and the Duke of Newcastle immediately resigned. This was on the 10th of February. The king now named Lord Granville Secretary of State, and Lord Bath First Lord of the Treasury, in the hope that he might still retain the services of Mr. Pelham as Chancellor of the Exchequer. But the next day brought the resignations of that right honourable gentleman, of the Duke of Bedford, and of almost all the other Lords of the Treasury and the Admiralty. Those of Lord Hardwicke and others were expected immediately to follow. In this extremity the king sent for Mr. Winnington, and offered him the office of Chancellor of the Exchequer. Winnington's answer was, that it was quite impossible the proposed ministry could stand – that they could not count upon the support of more than thirty-one lords and eighty members of the House of Commons. The result was, that the next day his Majesty sent again for Winnington, and desired him to bring back the old ministry. On the 14th, accordingly, they were all reinstated in their former places; and on the 22nd, Mr. Pitt was admitted to office as Vice-Treasurer for Ireland in conjunction with the Earl of Cholmondeley. On the 6th of May following, he was appointed Paymaster General in place of Mr Winnington, who had died on the 23rd of April.

Mr Pelham continued at the head of affairs till his death, in 1754; and the only changes which took place among the subordinate members of the administration during the intervening time, were such as tended to strengthen the position and extend the influence of the premier. By the absorption into the government of almost all its leaders and chief orators, the opposition was for some time reduced in parliament to extreme insignificance. Mr. Pitt was now one of the most determined supporters of the very measures which the first ten years of his parliamentary life had been spent in condemning and opposing. Nor did he scruple to avow his change of opinion. In reference, for instance, to the claim of exemption from search for British ships when found near the coast of Spanish America, which, urged by the opposition in the time of Sir Robert Walpole, had involved the country in a war with Spain, and was afterwards abandoned at the peace of Aix la-Chapelle by the government of which Pitt was a member, he said in the House of Commons that he had indeed once been an advocate for that claim; but it was when he was a young man; he was now ten years older, and having considered public affairs more coolly, was convinced it could not be maintained. In the same manner very much of his old jealousy of military power and of the prerogative appears to have evaporated in the cooler consideration which he had now been enabled to give to such matters. We do not profess to doubt the perfect honesty of Mr. Pitt in this change of sentiment; and we may also think, that his more matured opinions were, upon the whole, more rational than those of his fervid and impetuous nonage as a politician; but the facts (which only furnish an instance of what has often happened) are worth recording as a lesson for such as are capable of understanding it.

The Prince of Wales, however, (from whom Pitt had separated himself a short time before his entry into the ministry), was still recognised as its head by so much of the old opposition as retained existence. The chief advisers of his Royal Highness were Lord Bolingbroke (who however did not sit in parliament), John Perceval, Earl of Egmont in Ireland (afterwards created a British peer by the title of Lord Lovel and Holland), a person now principally remembered for an extraordinary work which he printed in illustration of his ancestry, entitled, 'A Genealogical History of the House of Ivery, by James Anderson, D.D.;' Mr. Nugent, a gentleman of considerable abilities as a humorous speaker; and Dr. George Lee, a partisan of Lord Granville, under whom he had served as a Junior Lord of the Admiralty. It is understood that Dr. Lee was designed by the Prince for his prime-minister when he should come to the throne.

A new parliament met on the 10th of November, 1747. "The elections," says Smollett, "had been conducted so as fully to answer the purposes of the Duke of Newcastle and his brother Mr. Pelham, who had for some time wholly engrossed the administration." The king, he afterwards tells us, "received such addresses as the ministers were pleased to dictate. Opposition now languished at their feet." In fact, the session was distinguished by nearly complete unanimity.

The next session, however, which commenced on the 29th of November, 1748, was one of a very opposite character. The treaty of Aix-la-Chapelle, which was considered by many as in some respects a very inglorious termination of the war, had been signed on the 18th of October. The opposition having been very active in arranging their plans during the prorogation, began by violently attacking this Peace in the debate on the address. However, the great majority of the house was still with the minister. The adherents of the Prince were allied with the remains of what was called the country party, under the conduct of Lord Strange, son of the Earl of Derby, and Sir Francis Dashwood (afterwards Lord Le Despencer), the former of whom, especially, was distinguished by his ability and eloquence. "What the opposition wanted in strength," says Smollett, "it endeavoured to make up by spirit and perseverance. Every ministerial motion and measure was canvassed, sifted, and decried with uncommon art and vivacity: but all this little availed against the single article of superior numbers; and, accordingly, this was the source of certain triumph in all debates in which the servants of the crown were united." But at this period, it deserves to be noticed, the perfect agreement in their parliamentary conduct among the members of the government which is now usually exacted, was by no means always observed. "The servants of the crown," says the writer from whom we have just quoted, in another place, "were not so implicitly attached to the first minister as to acquiesce in all his plans, and dedicate their time and talents to the support of every court-measure indiscriminately. This was one material point in which Mr. Pelham deviated from the maxims of his predecessor, who admitted of no contradiction from any of his adherents or fellow-servants, but insisted on their sacrificing their whole perception and faculties to his conduct and disposal. That sordid deference to a minister no longer characterized the subordinate instruments of the administration. It was not unusual to see the great officers of the government divided in a parliamentary debate, and to hear the Secretary at War opposing with great vehemence a clause suggested by the Chancellor of the Exchequer." Although, however, the opposition contested every inch of ground with the ministry throughout the session, the latter carried all their measures by great majorities. In the session of 1749-50, their success was equally complete.

The next session commenced on the 17th of January, 1751; and again the division on the address showed a large majority for the government—203 against 74. Circumstances, however, soon after occurred which led to considerable changes in the Cabinet. On the 22nd of March, the Prince of Wales suddenly died in his forty-fifth year, leaving a son, afterwards George III., only eleven years

old, the heir-apparent to the throne. In the discussions on the bill which was immediately brought into parliament for the appointment of a council of regency, to act in case of the death of the king before the young prince should have attained his eighteenth year, some discordance of views was displayed between Pitt and Mr. Henry Fox (afterwards the first Lord Holland, and the father of Charles James Fox), who had first been admitted into the government as one of the Lords of the Treasury under Walpole, and had recently been promoted to the office of Secretary at War. The same thing was shown in other debates that took place about the same time. These public manifestations were only indications of a division that now existed in the ministry, and separated its members into two opposite and conflicting parties. One of these consisted of the Pelhams and their friends; at the head of the other, besides the Duke of Cumberland, who was not a member of the Cabinet, were the Duke of Bedford and the Earl of Sandwich, who had come in as one of the Junior Lords of the Admiralty on the formation of the Broad-Bottom administration, and had in 1748 been made First Lord, the Duke of Bedford being then appointed Secretary of State, on the resignation of the Earl of Chesterfield, who had received the seals of that office in November, 1746, when Lord Harrington, by whom they had been previously held, was substituted in his place as Lord-Lieutenant of Ireland. Pitt and Fox, the two most conspicuously rising men of the day, and upon one or other of whom it was generally expected that the administration of affairs would eventually devolve, may be considered as having been the chief representatives in the House of Commons of these two hostile aristocratic factions. Pitt was the person whom the Pelhams wished to bring forward: Fox was the Duke of Bedford's man: and in this way was begun that rivalry between the two, which not only divided them during their lives, but was perpetuated in their sons. At the present crisis, the influence of the Pelhams prevailed. In the beginning of June Lord Sandwich was dismissed, on which the Duke of Bedford immediately gave in his resignation. The following new arrangements took place on this occasion. Lord Holdernesse became Secretary of State in the room of the Duke of Bedford, and Lord Sandwich was succeeded as First Lord of the Admiralty by Lord Anson. At the same time, the Earl of Granville again became a member of the Cabinet, being made President of the Council in the room of the Duke of Dorset. His lordship's fiery temper, however, seems to have been now pretty well burnt out; his few years of exclusion from office had transformed him into a very prudent personage, and he never again attempted to be either sole or chief minister. Some alterations, which it is unnecessary more particularly to notice, were also made among the subordinate members of the Boards of Admiralty and Trade, and among the officers of the household. Both Fox and Pitt continued to hold their places.

The power of the Pelhams was now greater than ever. Even in the House of Commons the opposition was nearly annihilated. In this state things remained till the unexpected death of Mr. Pelham, on the 6th of March, 1754. A few days after this event, it was announced that the Duke of Newcastle had been appointed to succeed his brother as First Lord of the Treasury and Premier. Mr. Pelham's other office of Chancellor of the Exchequer was given to the Honourable Henry Bilson Legge, who had been first brought into the government as one of the junior Lords of the Admiralty in 1745, had been made one of the Lords of the Treasury in 1746, and had succeeded Mr. Dodington as Treasurer of the Navy, in 1749. It is probable that Newcastle would have named Pitt as successor to himself in his office of Secretary of State, had not the King's prejudices against that gentleman been still found to be unconquerable. As it was, Mr. Fox was, in the first instance, nominated to the place: but on the day after, finding that he was not also to succeed Mr. Pelham as leader of the House of Commons, he declined the appointment. Upon this, it was given to Sir Thomas Robinson, a protegé of the Duke's, who had for some years past resided as ambassador at the court of Vienna; and, ill-qualified as he was for its duties, it was arranged that this person should also occupy the post of ministerial leader in the Commons, which had been refused to Mr. Fox. Lord Granville was continued as President of the Council; Lord Gower as Lord Privy Seal; Lord Anson as First Lord of the Admiralty; the Earl of Halifax, who had succeeded Lord Monson in that office in 1748, as First Lord of Trade; the Earl of Holdernesse as the other Secretary of State; the Duke of Montagu as Master-General of the Ordnance; Lord Edgecumbe, who had succeeded to that office in 1743, as Chancellor of the Duchy of Lancaster; Mr. Fox as Secretary at War; and Mr. Pitt as Paymaster-General. Pitt's friend and relation, Mr. George Granville, was made Treasurer of the Navy, in the room of Mr. Legge; and Mr. (now Sir George) Lyttleton, was appointed to the lucrative office of Cofferer of the Household. Grenville and Lyttleton had previously had seats at the Treasury Board. Considerable changes were also made among the subordinate members of the three Boards of the Treasury, the Admiralty, and Trade. Finally, the Honourable William Murray (afterwards the celebrated Chief Justice, and ennobled by the title of Earl of Mansfield) who had long been one of the most able and active partisans of the ministry in the House of Commons, was made Attorney-General, on the promotion of Sir Dudley Ryder, who had held that office since 1736, to the Chief-Justiceship of the King's Bench.

A few weeks after these arrangements were made, the Parliament, which had lasted for nearly seven years, was dissolved, and a new one called. "The elections for the new parliament,' says Smollett, "generally succeeded according to the wish of the ministry; for opposition was now dwindled down to the lowest state of imbecility. It had received a mortal wound by the death of the late Prince of Wales, whose adherents were too wise to pursue an ignis fatuus, without any prospect of success or advantage. Some of them had prudently sung their palinodia to the ministry, and been gratified with profitable employments: while others, setting too great a price upon their own importance, kept aloof till the market was over, and were left to pine in secret over their disappointed ambition. The maxims of Toryism had been relinquished by many, as the barren principles of a losing game; the body of the people were conciliated to the established government; and the harmony that now, for the first time, subsisted among all the branches of the royal family, had a wonderful effect in acquiring for them a degree of popularity which they had never before enjoyed."

The new parliament assembled on the 14th of November, and the address was voted unanimously. But in the midst of this apparent harmony, the dissensions which the recent arrangements had produced among the members of the government were about to create a new opposition. Both Pitt and Fox considered themselves to have been used ill by the new premier; and, forgetting their old rivalry in this common resentment, they were early in the session formally reconciled to each other. The alliance thus formed was also joined by Mr. Legge.

Meanwhile, the unfitness of Sir Thomas Robinson for the situation in which he had been placed had become sufficiently apparent. An extraordinary scene which took place in the House of Commons on the 25th of November, is thus described in a letter from Fox to Lord Hartington, and may be taken as a sample of the good agreement now subsisting among the members of the government, and the sort of respect they entertained for each other. A petition had been presented against the return of Lord Fane, one of the Commissioners of the Board of Trade, for Reading. When it was proposed to appoint a day to consider this petition, Pitt remarked that it would demand their best attention, as it regarded a noble lord: "he then," proceeds Mr. Fox, "made a panegyric on Lord Fane, to make which was undoubtedly the sole motive of his speaking; nor did he say one word on the cause. This needed not have called up a Secretary of State; but Sir Thomas Robinson rose, and with warmth, among other things, asserted that it would be a short cause, and on the side of the sitting member a *poor* cause. Pitt handled him roughly; Sir Thomas answered with passion; and Pitt replied. I then spoke (for I dreaded what your Lordship foresaw might be offered, and thought these things tended to it); I expressed great regard for Lord Fane, and excused Sir Thomas Robinson's irregular and blameable expression, by his twenty years' residence abroad, where he had done honour to himself and to his country, and which easily accounted for his total inexperience in the matters now before us. He did not like it. Pitt and he had talked of his great office; and Sir Thomas Robinson said it was well known he had not been ambitious of it. Pitt believed it, and gave him to understand, that if anybody else had been so, he would not have had it."

In another debate, which took place on the 26th of

February following, on the subject of a bill brought in by the Lord Advocate for regulating the office of sheriff-depute in Scotland, Pitt took his stand in direct opposition to his colleagues, and in a long speech against the proposed measure, attacked the Attorney General in particular with the most unmeasured asperity. Murray was at this time strongly suspected of being engaged, under the sanction of Newcastle, in an intrigue to effect a junction with the Tories, and to this proceeding Pitt directly pointed his allusions. Instead of dismissing him in these circumstances, the timid Duke of Newcastle attempted to win him over by negotiation. Old Horace Walpole (as he is commonly called, to distinguish him from his more celebrated nephew) was employed, in the first instance, as go-between. The Honourable Charles Yorke, the son of Lord Hardwicke, was next sent by the Premier, with overtures to his haughty subaltern. Afterwards, the Chancellor himself went on the same errand. On the 2d of September an interview took place between Newcastle himself and Pitt, at the desire of the former; but all ended in nothing. On this result, the Premier made application to Fox, with whom he was more successful. That gentleman, having again entirely separated himself from Pitt, on the 15th of November accepted the seals of Secretary of State. It was high time, indeed, that some new arrangements should be made. The first day of the session, the 13th of this month, had exhibited the extraordinary spectacle of a violent opposition to the Address, headed by two members of the Government—Pitt and Legge. At the same time the incapacity of Sir Thomas Robinson would of itself have rendered the appointment of a new ministerial leader indispensable. Union in the government had now also become especially important, war having again broken out with France in the preceding July. This new quarrel between the two nations arose out of a question as to the boundaries of their respective possessions in North America, which unfortunately had been left unsettled by the treaty of Aix-la-Chapelle.

On the appointment of Fox as Secretary of State, Sir Thomas Robinson was disposed of by being made Master of the Wardrobe, and having a pension settled upon him for the lives of himself and his sons. Lord Barrington, the former Master of the Wardrobe, became successor to Fox as Secretary at War. On the 20th of November, Lord Holdernesse intimated, by letters to Pitt, Legge, and George Grenville, that the King had no further occasion for their services. The Earl of Darlington and Viscount Duplin (eldest son of the Earl of Kinnoul), two of the Lords of the Treasury, were soon after appointed joint Paymasters of the Forces; and Sir George Lyttleton, declining to act on this occasion with his old friends, succeeded Legge as Chancellor of the Exchequer. Grenville's place of Treasurer of the Navy was again given to Dodington, by whom it had been formerly held. About the same time the Duke of Marlborough was appointed Lord Privy Seal in the room of Earl Gower, who was removed to the office of Master of the Horse: and various other changes also took place among the officers of the household. It was upon this occasion, likewise, that Soame Jenyns was made a Lord of Trade on the resignation of the Honourable James Grenville.

But the government thus formed was destined to have but a short duration. In the course of the summer of 1756, the loss first of Minorca and afterwards of Calcutta, to the French, excited a ferment of indignation in the public mind, which vented itself in a storm of reproaches against the incapacity of the government. The King himself did not conceal his participation in the general disgust. To add to the difficulties in which Newcastle was now involved, he lost about this time his most powerful remaining supporter in the House of Commons by the elevation of Mr. Murray to the place of Chief Justice of the King's Bench, vacant by the death of Sir Dudley Ryder. The minister was extremely reluctant to make this appointment; but Murray forced him to comply with his demand, telling him plainly that if he should be refused, he would no longer act as Attorney-General.

A few weeks after this, Mr. Fox, seeing no doubt the issue to which events were driving, suddenly threw up his employment. This desertion at once overset the administration of the Duke of Newcastle. His Grace, after another ineffectual attempt to obtain the support of Mr. Pitt, who absolutely refused even to confer with him; and having subsequently offered the seals of Secretary of State, with no better success, first to Lord Egremont, and secondly to Lord Granville, gave in his resignation on the 11th of November. On the 19th, Lord Hardwicke followed his example. Before this, the King had desired Mr. Fox to endeavour to effect a union with Mr. Pitt, in order that they might proceed together to the formation of a new cabinet; but the latter, on being applied to, at once declined acting again with his old rival. In these circumstances the Duke of Devonshire was at length commissioned by the King to form a new government. Pitt was at this time the most popular man in England; and in addition to the influence which he derived from the public estimate of his talents, character, and services, and from his eminent standing in the House of Commons, he had lately strengthened his position by becoming an attendant at the levees of the young Prince of Wales at Leicester House, where Lord Bute already presided as a sort of future Premier elect. On the other hand, the Duke of Cumberland, with whom Fox was connected, was on anything but cordial terms with Bute and the Princess Dowager. These several advantages were more than enough to decide the contest between the two competitors for power. The Duke of Devonshire, having taken the office of First Lord of the Treasury to himself, named Pitt Secretary of State. Several of the other most important places in the ministry were also filled up with Mr. Pitt's friends. Lyttleton having been dismissed with a peerage, Mr. Legge became again Chancellor of the Exchequer. Earl Temple was appointed First Lord of the Admiralty in the room of Lord Anson, and Dodington again gave place to George Grenville in the Secretaryship of the Navy. Lord Gower became also once more Privy Seal. Among the partial changes which were made in the subordinate offices, was the restoration to place of the Honourable James Grenville, who now obtained a seat at the Treasury Board. The Great Seal was in the meantime put in commission.

These several new arrangements were not all completed till nearly the end of December. In a few months more they were again all overthrown. The pretensions of the Duke of Newcastle, many of whose adherents had been left in the government, and whose parliamentary influence was still very great, aided by the zealous efforts of the Duke of Cumberland, offended at the exclusion of Mr. Fox, to prejudice the King's mind against his new ministers, were not long in producing their natural effect. His Majesty's old dislike to Mr. Pitt was not likely to be removed or softened by the manner in which [illegible] had at length been brought into power, on the tide of the popular will. It is said that Lord Temple was even more disagreeable to the King than Mr. Pitt. The frank and careless manners of that nobleman, which made him a general favourite in society, gave great offence at court, and threw him open to all sorts of misrepresentation by those whose business it was to poison the royal ear. Under the feelings thus engendered his Majesty again turned his thoughts towards the Duke of Newcastle. So early as the beginning of March 1757, the Earl of Waldegrave was commissioned to confer with his Grace, and also with the Duke of Cumberland and Mr. Fox. Newcastle's avarice of power on the one hand, and his timidity on the other, protracted these negotiations for some weeks till at last his indecision and constant vacillation provoked the King to resolve upon attempting to arrange matters without his assistance. Determined, however to get rid at all hazards of his present servants, in the beginning of April he dismissed Lord Temple from the Admiralty, and appointed Lord Winchelsea First Lord in his stead. Upon this Pitt and Legge immediately gave in their resignations; and the country was again left without a government.

The popularity of Pitt and his friends was now unbounded. The freedoms of many of the principal corporations throughout the kingdom were presented to him and Mr. Legge, accompanied with addresses couched in terms of the warmest admiration, and everywhere the popular enthusiasm showed itself determined to urge all constitutional means for carrying both of them back to power. Meanwhile the court in vain made applications in every direction—to Lord Egremont—to Lord Halifax—to Charles Townshend—to Lord Duplin—even to Sir Thomas Robinson. All these persons declined having anything to do with the arrangement of a new ministry. In this extremity his Majesty again resorted to the Duke of Newcastle; but it was by this time manifest to everybody that his Grace and his friends could never again form an administration alone. It was now earnestly recommended by Lord Chesterfield that efforts should be made to

unite the several contending parties in the state; and a scheme was submitted to the king founded upon that principle. But when his Majesty found that it implied the return to the Cabinet of Lord Temple, and the exclusion of Mr. Fox, he instantly rejected it. The negotiation with Newcastle was now once more renewed, and again ended in nothing. At last Lord Waldegrave himself was prevailed upon to accept the office of First Lord of the Treasury, Mr. Fox being, at the same time, nominated Chancellor of the Exchequer and the Earl of Egremont Secretary of State. These three individuals met thrice in council, along with Lord Granville and Lord Winchelsea: but only to arrive at the conviction that such a government had no chance of standing. They felt themselves compelled to inform his Majesty that there was an absolute necessity he should look for other aid.

It was now the beginning of June: and for the last two months the seals of Chancellor of the Exchequer had been in the hands of the Lord Chief Justice of the King's Bench, who is usually appointed to execute the office in the interval between the resignation of one Chancellor and the swearing in of his successor. On the 11th of June Lord Mansfield was summoned to attend the king at Kensington, and on that occasion was commissioned by his Majesty with the fullest powers to open negotiations at once with the Duke of Newcastle and with Mr. Pitt. About a fortnight more was consumed in adjusting the claims of the several competing parties: but before the end of the month a new ministry was at length completely arranged, with Mr. Pitt at its head. The new Premier took for himself the office of Secretary of State, along with that of leader of the House of Commons; the Duke of Newcastle was restored to his former place of First Lord of the Treasury; Mr. Legge was re-appointed Chancellor of the Exchequer; Lord Anson became First Lord of the Admiralty; Earl Temple, Lord Privy Seal; and Mr. Fox, Paymaster of the Forces. The Great Seal was given, with the title of Lord Keeper, to Sir Robert Henley (afterwards Earl of Northington), who had been made Attorney General on the recent promotion of Lord Mansfield; and Charles Pratt, Esq. (afterwards Lord Camden), became Attorney General. Lords Granville, Halifax, Hobbenesse, and Edgcumbe, were continued in their respective offices of President of the Council, First Lord of Trade, Second Secretary of State, and Chancellor of the Duchy of Lancaster. The Honourable George Grenville became again Treasurer of the Navy: Viscount Barrington remained Secretary at War, in which office he had succeeded Mr. Fox two years before. Mr. Nugent and the Honourable James Grenville had seats at the Treasury Board: and the Dukes of Devonshire, Rutland, and Leeds, the Earls of Rochfort, Thomond, and Gower, the Honourable R. Edgecumbe, the Honourable Charles Townshend, and Sir Thomas Robinson, obtained places in the Household, or were continued in those which they had previously held. The chief government of Ireland was committed to the Duke of Bedford.

The establishment of this new government, the creation, as it might be called, of a great popular victory, diffused the liveliest satisfaction throughout the nation—the prognostic of the brilliant restoration of the national fortunes which was soon to be accomplished under its auspices.

REPORT OF THE SELECT COMMITTEE OF THE HOUSE OF COMMONS ON THE LIGHTHOUSES OF THE UNITED KINGDOM.

This Report, with the Minutes of Evidence, and an Appendix of Documents, constitutes a volume of considerable bulk. At the end of the Appendix are two maps, in which all the lighthouses and lights round the coasts of the United Kingdom are laid down, with notices whether the lights are fixed, revolving, or otherwise. The following is a brief abstract of the more important points of the Report, presented either in the words of the committee or by abridgments of particular passages:—

"Your committee," it is stated, "have throughout been strongly impressed with the paramount necessity of having the best lighthouses and floating light establishments for this great naval and commercial country which the state of science can afford, and that every necessary expense should be incurred for their maintenance. The importance of the department is to be considered, both as it respects the safety of the immense property of merchandise which is brought to and taken from the shores of the United Kingdom, and also carried coastways from port to port; and as it regards the personal safety of his Majesty's subjects who navigate the commercial shipping and man his Majesty's fleets."

The inquiries of the committee were chiefly directed to what are termed the "Public General Lights," and which are supported by rates levied on British and foreign shipping generally. But as it appeared of importance to have information respecting the "Local or Harbour Lights," (which are, or ought to be, supported by the corporate bodies or communities that have erected them,) returns were called for regarding these also.

The 'public general lights' of England are seventy-one in number, including a lighthouse on the Island of Heligoland, off the coast of Holstein. Fifty-five of these "public general lights" belong to the Corporation of the Trinity House of Deptford Strond, their revenues being managed for the benefit and objects of that institution. Three have been leased by the Trinity House to individuals; seven have been so leased by the crown: four are held under patents, subsequently sanctioned by acts of Parliament; and two are under the management of the Trinity House, though the deficiency of the dues at one (that on Heligoland) is made up by Government, and the other is supported by the Admiralty.

After defraying the necessary expenses, a large surplus annually accrues to the Corporation of Trinity House out of the rates collected from the shipping for the support of the lighthouses. A considerable portion of this surplus is devoted to charitable objects, the promotion of which is deemed by the Board one of the duties imposed by their charter. A question has arisen whether dues can be levied on shipping for any other purpose than that of supporting the lighthouses, &c. "The General Shipowners Society in London, the Chamber of Commerce in Greenock, and others, object to such large sums being applied to charity, and call for relief to the shipping by a reduction of the dues." Select Committees of the House of Commons, in the years 1822 and 1824, recommended to the Brethren of the Trinity House to reduce their expenditure for charitable purposes, and lessen the amount of the imposts and restrictions on the shipping. But the Brethren have not deemed it their duty to attend to these suggestions, for in the year 1820 their expenditure on the almshouses and pensioners of the Trinity House amounted to 32,035*l.*, and in 1832 to 32,861*l.* The committee "are strongly impressed with the justice of limiting the charges upon shipping, in every case, to the purpose for which the charges are sanctioned, whether by patent or act of Parliament: and if there should be a surplus, that a reduction in the amount of these, and all other rates, should be made equal to the whole surplus." No objection is made by the committee to the present mode of appointing the objects of charity, or to the manner in which the bounty is dispensed—the objection is to the *principle* of taxing the shipping for any other purpose than that of supporting the lighthouses. "The Select Committee on Foreign Trade in 1822, questioned the right as well as propriety of applying the surplus light dues to the purposes of charity;" and in examining into the 36th of Elizabeth, and the charter of James II., by which the Trinity dues are regulated, they reported that "no specific appropriation of these dues is to be found, except what may be collected from the 62nd section of the last-mentioned charter, which directs the application of moneys received by decrees, orders, agreements, fines, forfeitures, or otherwise, to the repairing of the Trinity Almshouses and the relief of poor Brethren and their wives, and poor seafaring men. *The charge made on foreign ships does not appear to be authorized by any act, charter, or patent;* and the amount on British shipping *exceeds considerably* the rate sanctioned by the charter under which it is collected."

"It may even be conceded," say the present committee, that the surplus dues from the buoys and beacons, and the rent of land, might be applied to charity; but if the whole surplus from all these sources be applied to pay a just proportion or share of the expenses of the salaries of the elder Brethren and of the office establishment, there will be no surplus whatever for charitable purposes."

On a review of the evidence relative to the right of the Trinity House to retain a surplus arising from the light

dues, for the purpose of being applied to charitable objects, the committee, "after mature consideration, and referring to the Reports of the Select Committees of 1822 and 1824, recommend that all pensions and charitable allowances, now paid by the Trinity corporation from the surplus of the light dues under their management (except to servants and others belonging to the lighthouse establishment), shall cease with the lives of the individuals now on the pension list, so far as the same may be legally done; and that from and after this time no new pensions, save as above excepted, shall be admitted on, or paid out of the surplus of the light-house dues." And in the event of the Trinity House Brethren not deeming it to be their duty to attend to this recommendation, it is stated that "it is in the power of his Majesty in council, by the 3rd Geo. IV., c. 3, to require a reduction in the rates, prices, dues, duties, or tolls, imposed or granted by any charter or act of Parliament to the Trinity House;" "and if the Board," it is added, "should persist in applying the surplus light dues to charitable purposes after the House shall have decided to adopt the recommendation of your committee, it will be easy for his Majesty in council to require the Board to reduce the dues on each or on all these sources of income, until the Trinity Board shall not have any surplus to apply."

In order to form a correct opinion of the reduction that ought to have been made, or may now be, the following comparison is given of the clear income and expenditure of the Trinity House in two different years:—

	1820	1832
Amount of surplus for general purposes, arising out of light dues . .	£51,561	£40,167
Surplus of buoyage and beaconage .	2,769	3,643
Net profits of ballastage . . .	1,962	2,185
Interest on stock in the public funds .	6,960	4,781
Rents of estates for charitable uses .	2,316	3,797
	£65,568	£54,873
Expended on almshouses and pensioners,	£32,035	£32,861
For salaries, office expenses, &c. .	12,119	16,725
For new lighthouses, &c. . .	15,223	21,868
Cash vested in public stock . .	2,000	
	£61,407	£71,451
Balance in hand	£4,161	
Excess of expenditure		£16,581

The excess of expenditure in 1832 was augmented by the purchase of the North Foreland lights.

The Trinity House have at present a sum amounting to 155,873*l.*, arising from the surplus dues of former years, invested in public stock, yielding a yearly interest or dividend of 4,676*l.*, applicable to the general purposes of the corporation, and exclusive of those sums which are invested for particular charitable purposes under the management of the Board." Though the Brethren declined to attend to the recommendation of the previous committees, and have intimated to the present committee that the same disposition still prevails, "and that they are not disposed to reduce the charity they now dispense," they have reduced the rates formerly charged on all shipping for the objects of their institution. Since January, 1823, "one penny per ton has been charged on British oversea traders, and on foreign privileged vessels entering the port of London, instead of eightpence formerly charged; and foreign vessels not privileged have been reduced from eightpence to twopence per ton." The benefit of this reduction may be estimated by the fact, that the toll levied on the shipping in 1832 for 55 lights was less by 7,998*l.* than the toll levied in 1820 for 33 lights.

The "collection of the light dues" forms the next important topic which the committee investigated. "The gross amount collected for dues for 134 lighthouses in the United Kingdom, was 240,304*l.* in one year, 1832 33: the charge for collection, 22,135*l.*; and the expense of maintaining them 74,834*l.*; so that the amount paid for collecting the dues on the present system was one-third of the whole charge for maintaining them, a sum within 7,684*l.* of the whole expense for maintaining the sixty-five lights in Scotland and Ireland."

The Trinity Board have paid no attention to the recommendations of the committees of 1822 and 1824, respecting a decrease in the expense of collecting the dues, and the adoption of a simpler and more economical mode than the system now pursued. The present committee "have no doubt whatever that in almost every instance a reduction to the extent recommended by the Select Committee in 1822 might have been made; and, as they think, ought to have been made, immediately after the notice of Parliament was called to that subject: no sufficient reason is assigned why the reduction has not been made; and it does not appear that the Trinity Board have ever taken means to have the collections made at a reduced rate."

The committee suggest that the light dues levied for public general lights should be, by authority of the legislature, collected at the customhouses of the several ports, by the collector, or some responsible public officer in the customs, in the same manner as the duties of customs are collected; a plan by which, in their opinion, the whole of the 22,135*l.* now paid for collection may be saved, and they therefore recommend its adoption without delay.

"The erection of public lighthouses in England has been by individuals or by the Trinity House, to whom patents for the purpose had been granted by the crown, on the presumed general wish of the trade that the same was necessary, and would be useful; and petitions from merchants and shipowners have generally been presented at the same time to the crown, offering payment of certain tolls or dues for the maintenance of such lights when erected.

"Sir Edward Northe and Sir P. Yorke state it as their opinion that such offer to pay, and such application, ought always to precede the grant of authority by the crown. Sir P. Yorke further observes, that 'it was held to be expedient, at least, if not absolutely necessary, to take that course previously to the granting authority to the lessees to collect such duties;' and it is to be observed that opinion was given on the application for the renewal of a patent or lease.'

The committee cite a number of legal authorities, to the effect that *reasonable tolls* can only be lawfully exacted for the maintenance of the lights, for otherwise the grants or charters under which the lighthouses or other lights are held would be vitiated. "Besides the fifty-five lights in the management of the Trinity Board, there are fourteen lights in the hands of private individuals. The injurious effects of this latter arrangement will be apparent, by observing that the gross collection for these fourteen lights, in 1832, was 79,679*l.*, nearly as great a sum as is collected for the fifty-five lights under the Trinity Board. The allowance for collection was 10,244*l.*, and the expense of maintenance 9,109*l.*, leaving a net surplus of 60,322*l.*, to be divided among the proprietors—the lessees and the crown.

"The aggregate charge for light dues to the trade and shipping of the country in England in one year, was 162,717*l.*; the charge for collection of dues 16,914*l.*; the expense for maintaining the lights 45,013*l.*; leaving 100,789*l.* (levied by toll on shipping in one year) more than was actually required for the support of the lights.

"It should, however, be observed, that there never have been any lighthouses in Ireland held for the profit of private individuals; and the only lighthouse held by a private individual in Scotland was by the Duke of Portland, as proprietor of the Isle of May in the Firth of Forth, which was purchased by the Commissioners of Northern Lights in 1816, under the express sanction of the 54 Geo. III., c. 136.

"It is therefore in England only that any private individuals have a right to levy tolls on the commerce and shipping of the country for their private benefit; and it may be well to show in this place the total number of public general lights, the number of local or harbour lights, and the total amount of light dues levied in the United Kingdom at this time; also the proportion in number and the amount of income which private individuals receive from them."

From the table referred to it appears that there are in all 219 lights in the United Kingdom, viz., 105 public general lights on land, and 17 floating lights; 93 local or harbour lights on land, and 4 floating lights.

The following account is given of the number of public general lighthouses maintained in the United Kingdom; by whom held; the amount of light dues received; the charge for collection; the amount expended in maintenance, and the net surplus, in 1832.

No. of Lights	By whom held.	Gross Collections.	Charges of Collection	Expense of Maintenance.	Net Surplus.
55	Trinity House	£83,041	6,670	35,904	40,467
14	Private Individuals . .	79,676	10,244	9,109	60,322
25	Commissioners of Northern Lights	35,526	3,261	11,314	20,051
40*	Commissioners of Ballast Board, Ireland . .	42 061	1,960	18,505	21,596
134		£240,304	22,135	74,832	142,436

"Thus," proceed the committee, "it appears that a sum amounting nearly to one quarter of a million sterling, is annually collected as lighthouse dues on the shipping of the country, although the expense of maintenance of these 134 lights does not amount to more than 74,832*l.*, exclusive of 22,135*l.*, the charge of collection, which sum alone exceeds twice the amount of the expense of maintaining the whole of the French lights."

The committee enter into considerable detail respecting the lighthouses held by private individuals, and the nature of the grants or leases by which in these cases the right is claimed to levy dues. One proprietor, they state, "refused at first to comply with the order of your committee for an account of his receipts and expenditure for the lighthouse, alleging that by a clause in the act, 3 Geo. II., he was absolved from all such responsibility. But your committee could not compromise the power and authority of the House to demand and obtain accounts of all taxes levied on his Majesty's subjects;' and the return was made under protest. Several of the leases were renewed within these few years past, notwithstanding express recommendations of the Select Committees of the years 1822 and 1824, that they should not; and the present Committee censure this proceeding as "highly objectionable and improper, and by which a very heavy charge, beyond what is necessary for the maintenance of the lights, will be continued for the long period of twenty-one years, for which these leases have been granted.' The lease of the Eddystone Lighthouse, which had been granted for ninety-nine years, expired in 1808 and, on the application of the lessees for a renewal, the Lords of the Treasury referred the application to the consideration of the Trinity House. The reply of the Board was, "that any claim to a future term on the Eddystone Lighthouse, or to any compensation on account of services rendered by Mr. Weston or his family, as lessees of the light, is wholly inadmissible. As the trade of this country increased, the profits of the light augmented, and upon the separation of America the Americans paid as aliens. By this event, which could not have been calculated upon in 1755, the advantages to the lessees still further increased, and the profits of the light must have amply compensated them for any services and exertions." For these reasons the lease was not renewed; and the committee are of opinion that many of them might have been urged with equal force against the renewal of other leases.

The public general lights of Scotland are under the management of a Board denominated the "Commissioners for Northern Lighthouses," "incorporated as such by the 38 Geo. III., c. 58; and the commissioners hold their office at the Board by virtue of the public situations they fill." They are twenty-five in number, and, with the exception of the Lord-Advocate and the Solicitor-General for Scotland, are all municipal officers. Their services are gratuitous. They have no power to interfere with any of the local or harbour lights.

The lights of Ireland are under the superintendence of the Ballast-Board, a corporation consisting of twenty-three members, who are the Lord Mayor and Sheriffs of Dublin, three aldermen chosen by the Board of Aldermen, and seventeen other individuals, appointed in the first instance by the Act of Incorporation, but who have the power of filling up the vacancies.

The committee state, that having "had under their consideration the best mode of managing the lighthouses, they are of opinion that all the public general lighthouses and floating lights, to which the British and foreign shipping contribute, in England, Scotland, and Ireland (harbour and local lights excepted), should be placed under one Board, resident in London, and conducted under one system of management.

"Captain Drummond recommends a Board consisting of four persons; one to be a seaman, and the hydrographer of the Admiralty, another to be a scientific chemist; a third, a member of the Royal Society, and an optician; and the fourth, the President or Vice-President of the Board of Trade. Such a Board, with a secretary and proper officers, he thinks, would keep up the lighthouses to the existing state of science."

But the committee, after a review of the mode of managing the French lights, and of the constitution of the Trinity House, think that, on the whole, "the corporation of the Trinity House of Deptford Strond, having been chartered '*for the good government and increase of Navigation*;' and the office of buoyage and beaconage having been granted to that body upon the surrender thereof by the Lord High Admiral, and the greater part of the lighthouses in England having been erected, and being now maintained by that corporation; and being satisfied, after inquiry into the lights now under their charge, that the said corporation are well calculated, after some modification in the regulations under which they admit their members, to have the management and control of the whole department of lights; recommend that all the public general lights in the United Kingdom be placed under the management of the said corporation. The committee also recommend that in consideration of the extended public duties which it is proposed will be performed by the corporation of the Trinity House, the regulations established for the admission of younger and elder Brethren should be revised and enlarged, in order that officers in his Majesty's navy, and other scientific persons, may be admitted thereto, and take part with those chosen from the merchant sea-service in the active discharge of the duties of the corporation."

Our limits have prevented any abstracts being made of other points considered in the Report. Among these are the results of several experiments which were made to ascertain the best mode of illuminating the lighthouses, and a number of details respecting the management of the Scotch and Irish lights. The committee conclude with an expression of hope that no time will be lost in carrying their recommendations into effect

* Including nine harbour lights paid for by the commissioners, and five supported by other Boards.

ELECTION OF SPEAKER.

The following notices of the most remarkable contests which have taken place in former parliaments, on the question of the appointment of Speaker of the House of Commons, may be interesting at the present moment.

In 1566 (the 8th of Elizabeth) Parliament re-assembled after a long prorogation on the 30th of September, when the Commons found themselves involved in a difficulty which had never before occurred, by the death of their Speaker, Thomas Williams, Esquire, during the prorogation. It was considered that they could neither act without a Speaker, nor proceed to the election of a new one without the direction or permission of her Majesty. A committee was at last appointed to wait upon the Lords in order to have their opinion of what ought to be done; and it was afterwards agreed to send a deputation of both Houses to her Majesty to learn her pleasure. The result was, that the next day a commission under the Broad Seal, addressed to the Lord Keeper, was read in the Upper House, in which his Lordship was commanded to call the Commons before him, as is usually done at the opening of a new parliament, and to acquaint them that her Majesty's pleasure was that they should resort to their usual place, and there choose a new Speaker, after their accustomed manner. On this Sir Edward Rogers, Comptroller of the Household, moved in the first place that Richard Onslow, Esquire, her Majesty's Solicitor-General, who was a member of the House of Commons, should be brought down thither from the Lords, where he was in attendance in his official capacity, as was then the practice. This preliminary motion was made, because it is necessary that the person proposed as Speaker should always be present at his nomination and election. The motion being carried, and notice having been sent to the Lords, Onslow was accordingly sent down to the Commons,

where he endeavoured at first to show, that, having a writ of attendance upon the other House, his services could not be demanded in the office in which it was now proposed to place him. His objections, however, were overruled; and Sir Edward Rogers having formally proposed him for the Chair, he was elected by a majority of 82 to 70.

In those times it was common for every person proposed as Speaker to profess the greatest reluctance to be elected; but in this instance the opposition expressed by Onslow seems to have been sincere. It is only in this way that we can account for the House dividing upon the question: for no other candidate seems to have been proposed. It is curious that the Speaker who succeeded Onslow, Mr. John Popham (afterwards knighted), was also when elected her Majesty's Solicitor-General, and as such, though a member of the House of Commons, accustomed to give his attendance in the House of Lords. The Journal states that previous to his election, on the 18th of January, 1581, he was brought down from the Lords by the Queen's Serjeant and the Attorney-General, and "restored to the House of Commons as a member of the same."

It was usual, down to a much more recent date, for the Speaker, at the same time that he occupied the chair, to hold an office in the Government. Thus, Onslow continued to be Solicitor-General for two years after his election as Speaker. The same two offices were afterwards held together by the celebrated Sir Edward Coke. Sir Edward Seymour, who was Speaker in the reign of Charles II., was at the same time Treasurer of the Navy. Mr. Harley (afterwards Earl of Oxford), in the reign of Queen Anne, held the office of Secretary of State while Speaker. And even Mr. Arthur Onslow, who filled the chair for many years in the reign of George II., was for some time after his appointment Treasurer of the Navy. This however was, we believe, the last instance. In former times it was sometimes objected to a Speaker that he was even a Privy Counsellor: but that objection was never recognised by the House. It was brought forward, however, in a very curious debate, which is recorded to have taken place on the 27th of October, 1673 (the 25th of Charles II.), in reference to the then Speaker, Mr. (afterwards Sir) Edward Seymour, who had been called to the chair a few months before. Mr. Littleton rose, and after stating that many objections had been taken to the Speaker when he was first proposed, proceeded to take exception to his continuance in the office on the ground that he was a Privy Counsellor, a thing he maintained almost without a precedent, at least since the Reformation. "You might," he went on, "be made a Privy Counsellor afterwards, as a reward for your services, but not whilst you are Speaker. Other offices you hold inconsistent with that chair, and have admittance to the most secret counsels, and how improper is that, we having no man to present our grievances but you! You are too big for that chair and for us; and you, that are one of the governors of the world, to be our servant, is incongruous." He then moved for the appointment of another Speaker *pro tempore*. The motion was seconded by Sir Thomas Clarges, who considered what had been said so rational, that he could not think any man could be against it, "We entrust you," he said, "with all our secrets; and in your predecessors' times no Speaker had liberty to go to court without leave." He then insisted that, according to the standing order, the member who was reflected upon should stand up, make his defence, and then retire. He was answered by Sir William Portman, who observed, "What we say here can be no secret among four hundred men;—persons in the Hall know what we do." Sir Joseph Tredenham, who followed, contended that none were more fit for Speakers than Privy Counsellors. All the precedents, however, which he quoted in favour of this doctrine were from times preceding the Reformation. In a subsequent part of the debate Mr. William Harbord took up a new ground. "You expose," said he to Seymour, "the honour of the House in resorting to gaming-houses, —with foreigners as well as Englishmen—and ill places. I take this to be a great misdemeanour. As for your being a Privy Counsellor, I think that no exception; but I am sorry to see the honour of the House exposed. I think you to be an unfit person to be Speaker by your way of living." Colonel Strangeways said that what he had heard weighed but with him. "You are charged here," he continued, "for being a gamester. I wish men were guilty of no greater crime. The judges may as well be excepted against." The Speaker then," proceeds the Report, "rose up and complimented the House to this effect, that he held no employment a greater honour to him than that which he had in their service, &c. The question being propounded, that Mr. Speaker do leave the chair, and a Speaker *pro tempore* be appointed; the question being put, that that question be now put, it passed in the negative." That is to say, as we should now express it, the previous question was moved and carried. The arbitrary conduct of Seymour in the chair afterwards occasioned various discussions; but these we cannot at present notice.

One of the most remarkable instances of a Speaker holding another office at the same time that he occupied the chair of the House of Commons, is that of Sir John Trevor, who was first chosen Speaker in 1685, in the reign of James II., and again in March, 1690, at the opening of the first Parliament after the Revolution (with the exception of the Convention, of which Mr. Powle was Speaker. In March, 1694, he was expelled from the House on being convicted of having received a gratuity of a thousand guineas from the City of London, the reward of his service in getting a bill passed through the House, in which that corporation was interested; but, strange as it seems, having been appointed Master of the Rolls in 1692, he not only continued to hold that lucrative place during all the time he was Speaker, but retained it for many years after his disgrace—in fact till his death in 1717.

On Trevor's expulsion, Mr. Wharton, Comptroller of the Household, being a member of the House of Commons, rose and, addressing the Clerk, intimated the King's commands to the House to proceed to the choice of a new Speaker. He then proceeded to nominate Sir Thomas Littleton; but before he had pronounced the name there was a general cry of "No, no," and several members rose up to speak to order, on the ground that it was contrary to the undoubted right of the House of choosing their own Speaker, to have one proposed to them by a person who brought a message from the King. "Notwithstanding," continues the Report, "the Comptroller stood up again and named Sir Thomas Littleton: which was seconded by Sir Henry Goodrick. Whereupon arose a debate; and another person, Paul Foley, Esquire, was proposed by Sir Christopher Musgrave, and seconded by the Lord Digby: and after a long debate, in relation to both the persons, the question was put by the Clerk, that Sir Thomas Littleton take the chair of this House as Speaker. The Clerk declared the Yeas had it. The House was divided; the Yeas on the right hand, and the Noes on the left. Two tellers were appointed by the Clerk; namely, for the Yeas, James Chadwick, Esq. 146; the teller for the Noes, Colonel Granville, 179. So it passed in the negative." It was then unanimously resolved that Mr. Foley should take the chair. He was the following day presented in the House of Lords to the King, and approved of by his Majesty.

There appear to have been several divisions before this on the question of the appointment of Speaker; but this, we believe, is the first (with the exception of that which took place at the election of Mr. R. Onslow) of which the numbers have been preserved. The present appears, in fact, to have been the first occasion on which two candidates were brought forward.

On the assembling of a new Parliament, on the 22nd of November, 1695, Mr. Foley was again unanimously called to the chair. But when the next Parliament met on the 6th of December, 1698, Somers and Montagu being now at the head of a Whig administration, Sir Thomas Littleton, being proposed as Speaker by the Government, was elected by a majority. It does not appear that any other candidate was actually proposed; but it is known that the Tories wished Harley to be chosen, and there was also a section of the opposition anxious to bring forward Sir Edward Seymour, who had been some time before turned out of the Cabinet. No account has been preserved of any debate which took place at the election; but the result seems to have been looked forward to with much anxiety, both by the Court and the public. Ralph, in his History of England, says, that "both parties seemed to think the issue of the Parliament in a good degree depended" on the choice of the Speaker; and he adds, that the election of Littleton "looked like a good omen on the side of the Court, promising a smooth and happy session."

The next Parliament met on the 30th of December, 1701, when Littleton was again proposed as Speaker by the Court. But this time the opposition carried the election in favour

of their nominee Harley. We have no account of the debate that took place on the occasion; all that is stated is, that Mr. Harley was elected by a majority of fourteen votes. Notwithstanding this vote, the ministry were considered to have a decided majority of adherents in this Parliament. The election appears scarcely to have been made a party question—though the opinion had certainly sprung up and been warmly maintained before this time, that the election of a Speaker was one of the most important occasions on which the House could give expression to its sentiments.

Harley continued Speaker till the meeting of Queen Anne's second parliament, on the 25th of October, 1705. The Government had recently taken a more liberal colour; and the Whigs, with the assistance of the Dissenters, had been very successful in the elections. On the first day of the session, "the appearance of the House of Commons,' says the Parliamentary History (vol. vi, p. 450), "was greater than had been known at the opening of any parliament for fifty years before, no less than 456 members being present. The first struggle was about the choice of a Speaker, by which a judgment was to be made of the temper and inclination of the members. The court declared for Mr. John Smith, a man of clear parts and of a good expression, who was then in no employment, but had gone through great posts in the former reign with reputation and honour, having been a Commissioner of the Treasury and Chancellor of the Exchequer. He had from his first setting out in the world been thoroughly in the principles and interests of the Whigs, yet with a due temper in all personal things in relation to the Tories. But the Tories all declared against him for Mr Bromley, one of the representatives of the University of Oxford, a man of a grave deportment and good morals, but considered as a violent Tory, and as a great favourer of Jacobites, which appeared evidently in a relation which he printed of his Travels. . . . . No affair of that sort had ever been carried with such heat on both sides as this was; so that it was just to form a judgment upon it of the temper of the House. After a debate of about an hour and a half, the House divided, and two members being appointed to tell the voices, Mr. Smith had 248, and Mr. Bromley 205 only." This result seems scarcely to have been expected by Mr. Smith's friends. Spencer Compton, who was himself Speaker some years afterwards, writing to Mr. Walpole (afterwards the celebrated minister), says, "I do not know whether you will think this contest worth your attendance, but sure some good may be struck out of this division. Lord Hartington continues ill of the gout, and Mr. Smith has a defluxion on his eyes, and if Mr. Walpole should be absent, the poor Whigs must lose any advantage that may offer itself for want of a leader." Walpole, however, was present, and seconded the nomination of the successful candidate.

The Parliament which met on the 16th of November, 1708, contained a large majority of members favourable to the government, which, Harley and Bolingbroke having been dismissed, had now, under the direction of the Earl of Sunderland, become entirely Whig. Sir Richard Onslow, a zealous member of that party, was accordingly unanimously called to the chair. "The Tories," Tindal tells us, however, "upon a surmise that the Court, or Whig party, would have been divided between Sir Richard Onslow and Sir Peter King, Recorder of London, had designed to have put up Sir Thomas Hanmer; but being disappointed in that expectation, they thought it prudent, not being able to make a majority, unanimously to concur with the rest. Indeed, the Tories perceived they had so little strength in this Parliament, that they resolved to lie silent, and to wait for such advantages as the circumstances of affairs might afford them." In 1710, however, when the Tories got in, and a new parliament was called together, the elections ran so greatly in favour of that party that Bromley was now chosen Speaker without opposition.

The next contest for this high office, we believe, was that which took place on the death of Sir John Cust, on the 22nd of January, 1770, in the middle of a session. This was immediately after the appointment of Lord North as Prime Minister. His Majesty's leave to proceed to the election of a new Speaker having been signified to the House, Sir Fletcher Norton was proposed by Lord North. Lord John Cavendish then proposed the Right Honourable Thomas Townshend. In seconding the latter motion, Lord George Sackville urged it as a ground for preferring Mr. Townshend, that while Sir Fletcher Norton had been practising in the courts below as a lawyer, his opponent had been "learning business of a superior kind, the business of the nation and of this house." The nomination of Mr. Townshend, who had not been aware that he was to be proposed till he came into the house, was supported by Mr. Burke and other members of the opposition; but on a division, Sir Fletcher Norton was elected by a majority of 237 to 121.

Sir Fletcher Norton (afterwards Baron Grantley) retained possession of the chair till the opening of the Parliament, which met on the 31st of October, 1780. On the 7th of May, 1777, during the sitting of the preceding parliament, Sir Fletcher had given offence to the ministry by some expressions which he had used on presenting to the King a bill for the better supply of his Majesty's household. "The Commons," he had said, "have not only granted to your Majesty a large present supply, but also a very great additional revenue; great beyond example; great beyond your Majesty's highest expense." When the attention of the House was afterwards called to these words, a motion was made and carried in opposition to the ministry, to the effect that the Speaker, in using them, "did express, with just and proper energy, the zeal of this House, for the support of the honour and dignity of the Crown, in circumstances of great public charge;" and the thanks of the House were given to him. The new elections, however, again gave the ministry the command of a majority, which they had for some time lost; and when the new parliament met, Lord George Germain rose, and on the pretence that the constitution of the late Speaker had been much impaired by the fatigues of preceding sessions, proposed that Charles Wolfran Cornwall, Esq., should take the chair. The motion having been seconded, Mr. Dunning rose. He expressed his astonishment that the noble lord (North) had not risen, and saved him the trouble of proposing the late Speaker to continue in the chair. At this time, he said, when in fact there was no vacancy, when the late Speaker was in the House, and to all appearance as capable of executing the duties of the office as ever, it struck him as the most singular of all measures, to confess, as the proposer and seconder of Mr. Cornwall had done, that the late Speaker was the properest of all persons to fill the chair with dignity, and in the very moment of making that confession to propose another candidate. He had expected, when the bad health of Sir Fletcher was urged as a ground for not continuing him in the chair, that it would have been stated to the House that Sir Fletcher had formerly applied to the Government, declaring his desire to resign the chair on the reason assigned. He concluded by moving that Sir Fletcher Norton be called to the chair. A very animated debate followed. Mr. Thomas Townshend, at the close of some remarks which he offered, observed, that the true, though unavowed, reason of the opposition to the re-election of Sir Fletcher, was his having made a speech on a memorable occasion which did him the highest honour—a speech which proved his impartiality as a Speaker, his zeal for his country, his feeling for the national distress. That was the reason of the present attempt to disgrace and insult him; and as it was unmanly and illiberal, he trusted every member, young and old, those who sat in the old parliament, and those who were newly chosen, would feel properly on the occasion, and join with him in supporting the motion of Mr. Dunning. Sir Fletcher, who had attempted to speak before, now rose, and began his speech by stating that his mind was made up not to go into the chair again on any consideration. The very great and increased duties of the office had, as the House must have witnessed, impaired his constitution materially, and he feared had weakened his intellects; his advanced years, also, disabling him from coping with his disorder. Referring, however, after some further observations in this strain, to the compliments that had been paid him by the proposer and seconder of Mr. Cornwall, he said that he should be an idiot indeed if he could possibly imagine he merited such compliments, or that his state of health, of which none of the King's ministers had ever received the smallest intimation from him, was the real cause of their moving for a new Speaker, without saying a word upon the subject previously to him. Every man, he was sure, who had the least pretensions to understanding, went before him in feeling that a consideration of his state of health was not the true motive for the present measure. He called upon ministers to tell him why he was thus disgracefully dismissed? If his conduct in the chair had been objectionable,

if it had been criminal, let the criminality be fully known, and let exemplary punishment follow, if there could be any punishment more severe than public disgrace. He pressed for an explanation the more earnestly, because he did assure the House upon his honour, that though he had been in town three days, he had never been asked whether his health would enable him to continue in the chair, should the House approve of his continuing there; nor had he been applied to, either directly or indirectly, on the subject of choosing a new Speaker. Mr. Fox next spoke, and inveighed with great asperity against the conduct of the ministers. "Good God!" he exclaimed, "what pitiful shifts are the ministers reduced to when they come down to the House, and tell us that our late Speaker is the ablest man in the world, the fittest to fill the chair, and in the same breath beg us to choose another gentleman! Sir Fletcher feels himself insulted; he complains of the insult, and he demands, honestly demands, to know the cause. Do ministers answer him? Does the noble lord in the blue riband speak out and fairly avow the cause of his removal? No; the noble lord takes refuge in a cowardly silence". The clerk, then, at Mr. Fox's desire, read the entry in the Journals, containing the thanks of the House to the Speaker for his speech to the King. Mr. Byng complained of the rudeness with which Sir Fletcher had been treated by the minister, who had assembled all his friends at the Cockpit and informed them of the intention of proposing Mr. Cornwall, but had never given the late Speaker the smallest intimation of such intention.—Mr Cornwall, then said a few words, after which Sir Fletcher Norton again rose, and declared that if anything could induce him to accept the chair again—he begged pardon for the expression—to aspire to it, it would be the contempt with which he was treated. He thought he had a right to an explanation. Mr. Ellis, however, in reply to this demand, merely said that he conceived every member had a right to vote for a new Speaker as he thought proper—that there was no intention to insult or disgrace Sir Fletcher Norton—but that in his opinion it was better to choose a Speaker of fresher health, and who, from his time of life, had more vigour, and was better able to encounter and sustain the fatigues of the office. But Mr. Rigby afterwards ventured a little farther. Repeating the position of Mr. Ellis, that every member had a right on this question to vote as he pleased without assigning any reason, he went on to deny that it was any part of the constitutional law of Parliament, that when a member was once elected to the chair of the House, he was to sit there just as long as he pleased, unless some charge of criminality could be made out against him. He then said, that with regard to the vote of thanks to Sir F. Norton, he had at the time expressed his disapprobation of it, and also of the speech that occasioned it. A great deal had been said about the conduct of Sir Fletcher while Speaker; perhaps he did not perfectly coincide in all that had been urged on that topic: and for this, and other reasons not fit to be given in that House, he was disposed to support the nomination of Mr. Cornwall. One part of Sir Fletcher's conduct had often appeared to him extremely wrong, and that was his relaxation of the rules of proceeding, and his want of strictness in preserving order, and keeping gentlemen within due bounds. He remembered Mr. Onslow was remarkable for an opposite conduct, and was said to have too much buckram in his manner. The younger part of the House complained that he carried matters with rather too high a hand; the fact, however, was, the House had then more dignity, its proceedings were then more grave and solemn, and people without doors treated it more respectfully than they had done since Sir Fletcher had filled the chair. Nothing of much importance fell from the other members that spoke; and when the House at length divided the numbers were found to be, for Mr. Cornwall 203, and for Sir Fletcher Norton only 134. The former gentleman accordingly was immediately conducted to the chair.

Mr. Cornwall died on the 2nd of January, 1789, during the sitting of Parliament. Mr. Pitt was at this time at the head of the administration; and when the house met on the 5th to fill the vacancy in the chair, the Earl of Euston, on the part of the Government, proposed the Right Honourable William Wyndham Grenville (afterwards Lord Grenville) for the new Speaker. One singular circumstance attended this occasion. It had been the usage, as we have seen, for the House, before proceeding to the election of a Speaker, always to have the permission or direction of the crown intimated to it; but the King being at this time incapacitated for exercising the functions of his office by illness, and no executive government having been yet appointed, that customary preliminary was necessarily dispensed with. The nomination of Mr. Grenville was seconded by Mr. William Pulteney. Mr. Welbore Ellis, from the opposition side of the House, then proposed Sir Gilbert Elliot; and the motion was seconded by Mr. Frederic Montague. After a few words in the usual strain, from each of the candidates, a division took place, when Mr. Grenville was elected by a majority of 215 to 144.

Mr. Grenville became Secretary of State in the beginning of June following; and on the 8th of that month, the Marquis of Graham, on the part of the ministry, proposed Henry Addington, Esq. (the present Lord Sidmouth) as the new Speaker. The motion was seconded by Mr. Grosvenor. Mr. Welbore Ellis then moved that the chair be taken by Sir Gilbert Elliot; and Mr. Montagu again seconded the motion. The debate which followed, in which Mr. Fox, Mr. Pitt, and Mr. Burke took part, turned entirely upon the personal qualifications of the two gentlemen who had been proposed: the opposition contending that Sir Gilbert Elliot was the preferable candidate on account, were it for nothing else, of his much greater experience in the House than had been enjoyed by his youthful opponent. The division was very nearly the same as on the last occasion; 215 votes being given for Mr. Addington, and 142 for Sir Gilbert Elliot

In the beginning of February, 1801, Mr. Addington having been appointed first Lord of the Treasury, Chancellor of the Exchequer, and Prime Minister, the House on the 11th of that month proceeded to elect a new Speaker, when Lord Hawkesbury (the late Lord Liverpool) proposed that Sir John Mitford (afterwards Lord Redesdale, and Lord Chancellor for Ireland) should take the chair. Mr. Sheridan on this occasion intimated his intention of proposing Mr. C. Dundas; but Mr. Pitt contending that that gentleman could not be nominated on the ground that he had not yet been sworn, and consequently was not present in the House, the proposition was not persisted in, and Sir John Mitford was unanimously elected.

Mr. Abbott, (afterwards Lord Colchester) who had succeeded Sir John Mitford as Speaker in 1802, resigned the chair, from illness, in May 1817, while Parliament was sitting. On the 2nd of June the House met to elect a new Speaker; when the Right Honourable Charles Manners Sutton was proposed by Sir John Nicholl, and Mr. Charles Watkyn William Wynn by Mr. Dickenson. The first motion was seconded by Mr. E. J. Littleton, the second by Sir Matthew White Ridley. After a short debate, in which Sir Charles Burrell, Mr. Sergeant Onslow, and Mr. Wilberforce spoke in favour of the nomination of Mr. Wynn, the House divided: when the numbers were found to be for Mr. Sutton 312, and for Mr. Wynn 150.

The last division on this question, previous to that in the present session, was that which took place at the opening of the last Parliament, on the 29th of January, 1833, when Sir Charles Manners Sutton was re-elected—241 votes having been given for him, and only 31 for his opponent, Mr. E. J. Littleton.

PARLIAMENTARY ABSTRACTS.

PRIVATE BILLS.

Standing order (18th of June, 1811) read.

Resolved—"That this House will not receive any petition for private bills after Friday the 13th day of March next."

Resolved—"That no private bill be read the first time after Monday, the 13th day of April next."

Resolved—"That this House will not receive any report of such private bill after Monday, the 22nd day of June next."

Member Returned.—Thomas Balfour, Esq., has been returned for Orkney and Shetland, in the place of G. Trail, Esq., the late member, by a majority of 114 to 84.

Abstract of various portions of the evidence appended to the Report of the Select Committee of the House of Commons on the State of Education.

Education in Prussia.—Abstract of the evidence of Dr. Nicholas Henry Julius before the Select Committee on the state of Education:—

Dr. Julius was born in Hamburgh, but resided for a considerable period in Prussia. He conducted a journal partly devoted to popular education, entitled 'Jahrbuecher der Strof und Besserungs-

Anstalten,' &c., that is, annals of prisons, pauperism, popular education, and charitable institutions in general, a part of which was filled by official documents, supplied by the Ministry of Instruction. The whole population of Prussia is about 13,000,000. The proportion of Catholics to Protestants in the kingdom is about five to eight; but in the Rhenish provinces, in Westphalia and Silesia, they are nearly equal. M. Cousin states in his Report, that there were 33 seminaries for teachers, or normal schools; but in the year 1833 there were 43, of which 11 were Catholic, 29 Protestant, and 3 of a mixed nature. The number of *pupils*, or *future teachers*, was 2036. The time or term of instruction for these pupils, who are intended for the instruction of others, is three years. The salary of a schoolmaster of a common elementary school varies, some may receive 30*l*., many receive no more than 10*l*., annually. Most of the country schoolmasters are the sons of farmers and organists, or are clever persons who enter the normal schools in order to be enabled to study and get forward as clergymen. It is made compulsory on parents to send their children to the elementary schools; the penalty for neglect is a pecuniary mulct or imprisonment. The clergymen both Protestant and Catholic, take great pains to see that the children attend the schools. The Ministry of Public Instruction is divided into three branches—worship, public instruction, and medical science, each forming a board with a director, but all under the superintendence of the individual who is termed the Minister of Public Instruction, and who forms the connecting link between the board and the government. There are about two million of children in the course of education in the elementary schools, the parents of whom all pay something towards the tuition of the pupils, except those who are receiving alms, whose names are on the poor list.

Abstract of a portion of the evidence of Professor Pillans of Edinburgh:—

Education in France and Germany.—Professor Pillans recommends, for the purpose of training schoolmasters for the sole purpose of tuition, the system adopted in Germany, and now adopted also in France. In France an institution of that sort, which is called Ecole Primaire Normale, consists of several masters, a director, who takes the general superintendence, and under him, masters appointed for the different branches of knowledge which the law of the country has decided to be most desirable for the *élèves-maîtres*, i.e., the candidates for a schoolmaster's situation, to acquire, pushing each branch only to the extent which is considered as most profitable to be attained by the population at large. In Germany and in France no *école normale* is established without at the same time an *école primaire*, that is, a common school for the elementary branches of instruction being attached to it. It is part of the law that there shall be an elementary school attached to every normal school, and during the two years devoted, according to the French law (the German law allots three), the last six months are to be devoted almost exclusively to instruction in practical teaching, after being previously instructed in the theory. There is a master whose business it is to deliver lectures and hold conversations upon the art of teaching. M. Pillans has been present when such lectures were going on, the lecturers addressing their instructions, on what is there called the pædagogic art, to attentive audiences of *élèves-maîtres*, all of whom were busy taking notes of the lecture. The schools in France are now all taken under the protection and surveillance of the government. Among those, by far the most numerous are the schools of the brothers of the Christian doctrine, or *Frères Ignorantids*, as they are also called, which are of very long standing in France, under the name of *Ecoles des Frères*. In 1833, there were 54 normal schools in France and 16 in progress. The law declares one to be necessary in every department. The whole system of education in France is called the University, which is coextensive with France, and means nothing more than the *tout ensemble* of all the educational means of the country. France is divided into academies just as it is divided into departments, only the former are much the larger. In every academy there is a rector, whose residence is at the principal town, and generally, unless it is a very large town, the Ecole Normale is situated there also. If it is a large town they very wisely declare that no Ecole Normale shall exist there. In Paris there is none, the Ecole Normale Primaire of Paris being at Versailles. The total sum allotted by the French government for normal and model schools, out of the million and half voted in 1833 for education, was 238,000 francs.

William Davis, Esq., states in his evidence (an abstract of part of which is given lower down), that he has known much about foreigners of the lowest class who have come to England for employment, "and," he adds, "I have scarcely known an instance where one of them (Germans) could not write his name and read his Bible."

Abstract of a portion of the evidence of William Allen, Esq.

Education in Russia.—When the Emperor Alexander was in Britain in the year 1814, Mr. Allen had a private interview with him, and explained the importance of putting the means of instruction into the possession of the common people of Russia. The Emperor was exceedingly pleased with the suggestions made to him, and when Mr. Allen went to Petersburgh in the years 1818 and 1819, he found that the plan proposed had been partially adopted. Mr. Allen saw a school at Petersburgh, in which were about two hundred soldiers. The school was well conducted, but upon the walls were a set of lessons in the Russ language, to which Mr. Allen objected. He took occasion to speak to Prince Galitzin on the subject, who mentioned it to the Emperor, and the consequence was that these lessons were stopped immediately throughout the whole of Russia. A selection was then made by Mr. Allen, assisted by some friends, from the Bible, which was approved, and the selection has since been printed in Russ, English, French, German, Portuguese, Spanish, Italian, and Arabic, and made the reading lessons of the empire.

Mr. Allen is treasurer to the British and Foreign School Society.

Abstract of a portion of the evidence of William Davis, Esq.

Gower's-walk School, Whitechapel.—Mr. Davis, in conjunction with three other gentlemen, built a school at a place called Gower's-walk, Whitechapel. There are at present about seven hundred children receiving education in Whitechapel under the system pursued; there might be more, but the surrounding parishes have now schools of their own, which at the time when the Gower's-walk School was founded (1808) they had not. The system pursued is the mixing up of industrious occupations with education. There is a printing-office in Gower's-walk school, and the boys are taught to compose the types and work at press. A considerable portion of the printing executed is received from the surrounding neighbourhood, the people employing the school press in the same manner as they would that of a common printing establishment. The chief part of the profits have been applied to clothing and rewarding the children, and applied in such a way as to induce them to stay to the latest possible period they can be kept in the school, for the purpose of completely establishing in their minds religious and moral truth. Those who have distinguished themselves as attentive and good boys, who are teachers of their little schoolfellows, or who have exhibited a particular talent and attention in the printing-office, are clothed, in order to stimulate the others. Those who work are seldom employed more than three hours in the day, and the labour is not continuous, one class superseding another class every two hours. No coercion is required to induce them to work, the boys volunteering; it is made so desirable, and they are so much more willing to have their fingers at work than to be employed in learning, that volunteers are never wanting in greater number than required. A portion of the earnings of the young workmen is retained, till they reach the age of fourteen, when, if they leave the school with a good character, it is paid over to them, for the purpose of enabling them to purchase clothes, or set themselves off comfortably as apprentices. The sums they thus receive on quitting the school, vary according to ability or industry, from 20*s*. to 7*l*., which latter is the highest amount that has been paid. Notwithstanding that they have been thus taught printing, very few have selected that business as a means by which to earn their subsistence in after life, not perhaps above a dozen of the whole number. The object sought by teaching them the business of printing, is to train them to habits of diligence and industry. Occupations of various kinds might be introduced, but in Gower's-walk School printing has been selected and persevered in, as being best adapted to the circumstances of the place, and at the same time yielding most profit. In the parochial or endowed school at Whitechapel, Mr. Davis recommended the other trustees to adopt knitting, as an industrious occupation, which, without occasioning much trouble, would answer the end proposed. It has been tried, and proved completely successful, the profit resulting from the labour of the boys in this mode of thus disposing of a portion of their time, amounting in the year 1833, to 17*l*. 17*s*. 6*d*. This school, being well endowed, scarcely requires pecuniary assistance, its funds enabling it to clothe the children. At Gower's-walk School, the funds raised, and profit arising from the industrious occupations of the boys, make it unnecessary for the parents to pay anything for the education of their children: it is considered that the children work for their education; their labour is taken and applied to a moral and religious purpose.

Abstract of the evidence of Captain Brenton, R.N.

The Brenton Asylum.—Captain Brenton has founded an establishment at Hackney-wick, now termed the Brenton Asylum. It was originally established for the children of the most vicious portion of the poor. There have been received into it 514 children, of whom 270 boys and 40 girls have been sent abroad. The others have either been provided for by their friends, or have absconded, none have died. The age at which the children are usually admitted, is from ten to fourteen, the younger the better, for the greatest difficulty has invariably risen with the larger children. The children have been taken from the workhouses, from prisons, and from the streets. The course of training is as follows: when a boy is received into the school, he is carefully cleaned, and clothed in the school dress; he is then told what the intentions of those who receive him are towards him, and he is instructed to consider every boy in the school a brother; a system

of education is pursued, by which the boys are taught reading, writing, arithmetic, and spade husbandry. The children that have been sent abroad were intrusted to the care of Committees at the Cape of Good Hope, and Swan River, and also sent to Canada, under the care of an agent to be apprenticed to colonists.

Abstract of the evidence of the Rev. George Clarke.

Military Asylum at Chelsea—Mr. Clarke is Chaplain of the Military Asylum at Chelsea, the institution is for the education of the children of soldiers and non-commissioned officers. At present there are about 400 in the asylum, but during the war there were upwards of 1250. The institution is conducted on military principles; boys are serjeants, the head schoolmaster is serjeant-major, and over him is the chaplain. There is no influence exerted to induce the boys to enter the army, except that of association; they are brought up as soldiers, every term they hear is a military one, and they do everything by the sound of the drum. They are taught the first four rules of arithmetic, to read, to write, and at the same time trades are carried on. Everything they wear is made by themselves—their own shoes, clothes, shirts, and stockings. There were formerly girls in the school, also the children of soldiers, but these are now removed to an establishment in the country, for the purpose of being trained up as farm servants, &c. Upwards of one-half of the boys go from the institution into the army, and reports are received every year from the different regiments into which the boys are received, and the greater number are very satisfactory, a large majority of those who volunteer being well-behaved boys. Many of those who do not go into the army are apprenticed to trades, or go out as servants, and at the end of five years, if they produce a certificate from their masters of good conduct, they receive a reward of five guineas; a fair proportion of those apprenticed apply for the reward.

Abstract of a portion of the evidence of B. Braidley, Esq.

Educational Clauses in the Factory Bill.—"The Factory Act of last year gave no time to the public, or to the schoolmasters themselves, to erect or establish schools; but it required that, within a very short period, children should present themselves on the Monday morning after the act came into operation, and declare that they had been at school two hours each day in the previous week; whereas schools did not exist in sufficient numbers to accommodate them, nor was any master provided." Mr. Braidley thinks that in the first instance the act was found a dead letter, and had therefore a tendency to encourage parties in a continued carelessness as to the education clauses. The inspectors think it a part of their duty to make some reference to the non-execution of the enactment regarding education; but he considers that of two evils, they are right in choosing the least; and that when they find there is not machinery to work this part of the act, and that there is not a sufficient supply of educated hands, their duty "presents itself to them in this shape, whether they are to cause the works of large manufactories to stand still, or to wink at such evasions of the act as circumstances have thus rendered necessary. With respect to the Factory Bill, the clause which requires that the children shall attend school for two hours per day, does not provide the machinery to instruct them during those two hours; and a schoolmaster would think himself poorly remunerated who could have scholars for only two hours in the day, if he was to be paid only in the same ratio that other masters are."

In a printed paper circulated by the "Children's Friend Society," and which contains the names of the masters to whom the children sent out to the Cape of Good Hope have been apprenticed, there is an extract from the "South African Commercial Advertiser," from which we learn that "when the first division of these emigrants were landed here last year (in 1833), an opinion was entertained by some, originating in the former title of the Society—"for the Suppression of Juvenile Vagrancy"—that most, if not all of them, had been guilty of some crime or delinquency. And it is true that of many of them the society in London could only say that they knew nothing, except that they were found in a state of destitution. Their future conduct was therefore a subject of deep anxiety with the Committee in Cape Town, and they pressed on the Society in London the superior advantages likely to be secured to the public, both at home and in the colonies, by receiving destitute children into their asylums, if possible before they had been forced by their unhappy circumstances into vicious courses..... It is but justice to these children, however, to add, that though no fewer than 174 have been apprenticed during the last twelve months, *not a single case of theft, violence, or outrage, on the part of any one of them, has been brought under the cognizance of the magistrate.* During the first two or three months, a few cases of desertion occurred; but this was easily checked, as it seems to have arisen entirely from the novelty of their situation and a want of sympathy with the strangers among whom they were thus suddenly placed, and from all we have seen and heard on the subject, we are able to say that their conduct has been not only blameless, but praiseworthy.

The paper from which we have taken this extract contains the names of 106 boys and 18 girls, who have been apprenticed to individuals of the following trades or professions:—

Boys.	
To Farmers	48
Merchants	4
Schoolmasters	3
Clerk in Government office	1
Colonial chaplain	1
Civil commissioner	1
Commandants	2
Physician	1
Surgeon	1
Town Major	1
Various trades and professions	42
Sent back to England	1
	106

The 18 girls were placed in different families, of which the names of the heads are given. It is also stated that 47 boys and 11 girls had arrived at the Cape by three different vessels, most of whom had been apprenticed.

TRADE, STATISTICS, &c.

Law Students, France.—The French schools of law were reorganized under the decree of the 15th of March, 1804. The decree requires that all pupils desirous of obtaining a certificate of competency as attorneys (*avoués*), should follow a full year's course of study, and submit to an examination. If desirous of a diploma of licentiate, which is necessary in order to obtain admission into the class of barristers (*avocats*), they must have previously passed through a three years' course of study, and four examinations, as well as have held a public disputation; and lastly, if desirous of obtaining the more elevated rank of a doctor, they must have pursued a four years' course of study, passed six examinations, and have held two public disputations. A later law, that of the 10th of May, 1806, converted the schools of law into faculties of law, and declared them an integral member of the Imperial University of France. There are at present nine courses of law delivered in the faculty of law at Paris. The diplomas annually granted are as follows:—Diploma of Competency, about 140; to Bachelors, from 980 to 1000; to Licentiates, about 650; and to Doctors, about 25 or 30. One-half are granted by the School of Law, in Paris; the remainder by the Schools of Aix, Caen, Dijon, Grenoble, Poitiers, Rennes, Strasburg, and Toulouse. The amount of fees received by all the schools of law in France is about 31,250*l.* (781,400 frs.) per annum.—*Journal of Education.*

Number of Foundlings received, maintained, and educated by the French Government.

In 1819	99,346
1820	102,103
1821	106,000
1822	109,000
1823	111,000
1824	116,749
1831	122,981

Expended, 8,725,84 francs, or 360,000*l.*

Lighthouses in France.—The lighthouses in France are under the management of the commissioners for bridges and roads, and the whole of the expense is paid by the French Treasury. There were, in 1830, in all, 60 lights on the coast of France; and the expense for 1834, for 73 lights, is estimated at 200,000 francs, or about 8000*l.* sterling, being about 110*l.* each on an average.

Lighthouses in the United States.—In the years 1832, 1833, the Treasury paid 231,850 dollars, or 29,300*l.*, for the maintenance of the lights on the coasts, exclusive of building new lighthouses. During the same period, there were 19,266 dollars (4281*l.*) collected from vessels, not of the United States, entering the ports, at the rate of 50 cents. of a dollar per ton, and collected under the same regulations as other tonnage duties. The public treasury of the United States thus pays all the expenses of the light establishment, and no rate is imposed as light dues on their own shipping.

Taking the British tonnage in 1832 at 2,618,068, and the foreign tonnage at 874,605, making 3,492,673, tons, a rate of 1*s.* per ton once in the year would raise 174,633*l.*, a sum amply sufficient to support the light establishments, and build new lights, &c. At present, the yearly charge on British and foreign shipping for this purpose is 240,304*l.*

Private Lighthouses in England.—The net annual surplus, over the expense of maintenance, &c., which accrues to individuals who hold lighthouses under patents or leases in England is, in some instances, very great. The Smalls lighthouse yields nearly 11,000*l.* annually of clear profit. Other four lighthouses yield nearly 20,000*l.*, which is divided between the lessees and the crown. One gentleman, who only receives a share of the profits of the Dungeness lighthouse, netted, in nine years, 55,495*l.*

THE REVENUE.

An Abstract of the Net Produce of the Revenue of Great Britain, in the Years and Quarters ended 5th of January, 1834, and 5th of January, 1835, showing the Increase or Decrease under each head thereof.

N.B.—The column for 1828 includes other periodicals as well as newspapers. The numbers in the column for 1834 assigned to Pennsylvania, Virginia, Ohio, Indiana, and Illinois, are chiefly by estimate, the exact numbers not having been ascertained. The estimate is stated to be probably below the real numbers.

Returns of the Population of Denmark, (the Duchies of Schleswig, Holstein, and Lauenburg excepted,) according to the Census taken by order of the Danish Government, on the 8th of February, 1834, as compared with the Population in 1801.

Districts.	Superficies in Geographical Square Miles.	Census of 1801.	Census of 1834.	Increase of Population.	Increase per Cent.
Zealand, &c.	133.6260	361,523	464,607	103,084	28 per Ct.

North Jutland	448.4203	389,093	525,952	136,859	35 per Ct.
	683.6372	924,974	1,223,807	298,833	32 per Ct.

Belgian Revenue.—In an official comparative view of the indirect taxes for 1833 and 1834, published in the *Moniteur Belge*, it is stated that there was a net increase of 320,200 francs during the last year; and that the receipts exceeded the estimates by the sum of 3,176,173 francs. All the branches of the revenue had increased, except the tax on brandy distilled in the kingdom, in which there was a diminution to the amount of 1,709,477 francs.

Grants for the Promotion of Education and Science in Saxony.—The budget for churches, academies, and schools, in the kingdom of Saxony, for the present year, contains the following among other items:—

	The original sums are in dollars equal to
For the University of Leipzig	£4,675
Protestant Churches and Schools	4,199
Catholic ditto	2,669
Deaf and Dumb Schools in Dresden	41
Military Seminaries	4,714
Completing the Income of Schools for the Education of Soldiers' Children	1,255
Mining Academy at Freyberg	1,379
Forest Academy and Agricultural Institution at Tharaûd	1,206
Academy of Arts in Dresden	2,756
Maintenance of the Galleries and Collections in Dresden	2,641
Support of several Societies of Arts, &c.	385
Academy of Medicine and Surgery	2,337
Botanical Garden, Dresden	117
	£28,574

There are fourteen gymnasia in Saxony, which has a population of about 1,500,000 souls; in Prussian Silesia, where the population is about 100,000 more, there are seventeen; and in Ducal Saxony, where the inhabitants are about 100,000 fewer, there are twenty-two. Each high-school in Saxony costs, on the average, about 12,000*l.* a-year, independently of buildings and fittings. The Catholic schools are eleven in number. All but two of them admit pupils gratuitously; and some are wholly supported by individual benevolence and endowments. The state does not expend more than about 3,200 dollars (480*l.*) a-year upon them. The number of pupils whom they at present educate is 1020.

POLITICAL RETROSPECT FOR FEBRUARY, 1835.

GREAT BRITAIN.

In the London Gazette of the 3rd of this month appeared an announcement that the King had been pleased to direct letters-patent to be passed under the Great Seal, appointing the Archbishop of Canterbury, the Lord Chancellor, the Archbishop of York, the Earl of Harrowby, the Bishops of London, Lincoln, and Gloucester, the Right Honourable Sir Robert Peel, H. Goulburn, C. W. W. Wynn, H. Hobhouse, and Sir Herbert Jenner, his Majesty's Commissioners "for considering the state of the several dioceses in England and Wales, with reference to the amount of their revenues, to the more equal distribution of episcopal duties, and to the prevention of the necessity of attaching, by commendam, to bishoprics benefices with cure of souls; also for considering the state of the several cathedral and collegiate churches within the same, with a view to the suggestion of such measures as may render them most conducive to the efficiency of the Established Church; and for devising the best mode of providing for the cure of souls, with special reference to the residence of the clergy on their respective benefices."

Before the end of January it was announced, by the publication of a correspondence between Lord John Russell and Mr. Abercromby, that the latter gentleman would, on the first day of the session of parliament about to commence, be proposed by the opposition for the office of Speaker of the House of Commons. On the other hand, it was known that the ministers intended to propose the re-appointment of the late Speaker, Sir Charles Manners Sutton. As it was considered that this contest would afford a good indication of the strength of parties in the new House, it was looked forward to during the month with anxious expectation; and the most strenuous exertions were made on both sides to bring up the whole force that each could command. The result was the assemblage, on Thursday the 19th of February, the day for which the Parliament had been summoned, of a larger number of members of the House of Commons than had ever before been collected. After the Parliament had been formally opened by commission, the Commons returned to their own place of meeting, and proceeded to the election of the Speaker. The re-appointment of Sir C. M. Sutton was proposed by Lord Francis Egerton, and the motion was seconded by Sir Charles Burrell; after which Mr. W. J. Denison proposed Mr. Abercromby, and Mr. W. Ord seconded the motion. A debate of some length followed, in which the principal speakers, besides Sir C. M. Sutton and Mr. Abercromby, were, for the motion of Lord Francis Egerton, Lord Stanley and Sir Robert Peel; and for that of Mr. Denison, Lord John Russell. About six o'clock the House divided, when the numbers appeared to be 306 for Sir C. M. Sutton, and 316 for Mr. Abercromby—a result which was received with loud cheering by the majority. Mr. Abercromby was then conducted to the chair; and next day, having appeared at the bar of the House of Lords, received from the Lord Chancellor the assurance of his Majesty's approval of the choice the Commons had made.

Friday, Saturday, and Monday, were employed in administering the oaths to the members. On Tuesday the 24th, at two o'clock in the afternoon, his Majesty came in state to the House of Peers, and addressed both Houses in the following speech:—

"*My Lords and Gentlemen,*

"I avail myself of the earliest opportunity of meeting you in Parliament, after having recurred to the sense of my people.

"You will, I am confident, fully participate in the regret which I feel at the destruction, by accidental fire, of that part of the ancient palace of Westminster which has been long appropriated to the use of the two Houses of Parliament.

"Upon the occurrence of this calamity, I gave immediate directions that the best provision, of which the circumstances of the case would admit, should be made for your present meeting; and it will be my wish to adopt such plans for your permanent accommodation as shall be deemed, on your joint consideration, to be the most fitting and convenient.

"I will give directions that there be laid before you the Report made to me by the Privy Council in reference to the origin of the fire, and the evidence upon which that Report was founded.

"The assurances which I receive from my allies, and generally from all foreign Princes and States, of their earnest desire to cultivate the relations of amity, and to maintain with me the most friendly understanding, justify, on my part, the confident expectation of the continuance of the blessings of peace.

"The single exception to the general tranquillity of Europe is the civil contest which still prevails in some of the Northern Provinces of Spain.

"I will give directions that there be laid before you Articles which I have concluded with my allies, the King of the French, the Queen Regent of Spain, and the Queen of Portugal, which are supplementary to the Treaty of April 1834, and are intended to facilitate the complete attainment of the objects contemplated by that Treaty.

"I have to repeat the expression of my regret that the relations between Holland and Belgium still remain unsettled.

"*Gentlemen of the House of Commons,*

"I have directed the estimates for the ensuing year to be prepared, and to be laid before you without delay.

"They have been framed with the strictest attention to economy; and I have the satisfaction of acquainting you that the total amount of the demands for the public service will be less on the present than it has been on any former occasion within our recent experience.

"The satisfactory state of the trade and commerce of the country, and of the public revenue, fully justifies the expectation that, notwithstanding the reductions in taxation which were made in the last session, and which, when they shall have taken full effect, will tend to diminish the existing surplus of the public revenue, there will remain a sufficient balance to meet the additional annual charge which will arise from providing the compensation granted by Parliament on account of the abolition of slavery throughout the British dominions.

"I deeply lament that the agricultural interest continues in a state of great depression.

"I recommend to your consideration whether it may not be in your power, after providing for the exigencies of the public service, and consistently with the steadfast maintenance of the public credit, to devise a method for mitigating the pressure of those local charges which bear heavily on the owners and occupiers of land, and for distributing the burden of them more equally over other descriptions of property.

"*My Lords and Gentlemen,*

"The information received from the governors of my colonies, together with the Acts passed in execution of the law for the abolition of slavery, will be communicated to you.

"It is with much satisfaction that I have observed the general concurrence of the colonial legislatures in giving effect to this important measure; and, notwithstanding the difficulties with which the subject is necessarily attended, I have seen no reason to abate my earnest hopes of a favourable issue.

"Under all circumstances, you may be assured of my anxious desire and unceasing efforts fully to realize the benevolent intentions of Parliament.

"There are many important subjects, some of which have already undergone partial discussion in Parliament, the adjustment of which, at as early a period as is consistent with the mature consideration of them, would be of great advantage to the public interests.

"Among the first in point of urgency is the state of the tithe question in Ireland, and the means of effecting an equitable and final adjustment of it.

"Measures will be proposed for your consideration which will have for their respective objects,—to promote the commutation of tithe in England and Wales, to improve our civil jurisprudence and the administration of justice in ecclesiastical causes, to make provision for the more effectual maintenance of ecclesiastical discipline, and to relieve those who dissent from the doctrines or discipline of the Church from the necessity of celebrating the ceremony of marriage according to its rites.

"I have not yet received the report from the commissioners appointed to inquire into the state of municipal corporations; but I have reason to believe that it will be made, and that I shall be enabled to communicate it to you at an early period.

"I have appointed a commission for considering the state of the several dioceses in England and Wales, with reference to the amount of their revenues, and to the more equal distribution of episcopal duties; the state of the several cathedrals and collegiate churches, with a view to the suggestion of such measures as may render them most conducive to the efficiency of the Established Church, and for devising the best mode of providing for the cure of souls, with reference to the residence of the clergy on their respective benefices.

"The especial object which I have in view in the appointment of this commission, is to extend more widely the means of religious worship according to the doctrines of the Established Church, and to confirm its hold upon the veneration and affections of my people.

"I feel it also incumbent upon me to call your earnest attention to the condition of the Church of Scotland, and to the means by which it may be enabled to increase the opportunities of religious worship for the poorer classes of society in that part of the United Kingdom.

"It has been my duty on this occasion to direct your consideration to various important matters connected with our domestic policy.

"I rely with entire confidence on your willing co-operation in perfecting all such measures as may be calculated to remove just causes of complaint, and to promote the concord and happiness of my subjects.

"I rely also with equal confidence on the caution and circumspection with which you will apply yourselves to the alteration of laws which affect very extensive and complicated interests, and are interwoven with ancient usages, to which the habits and feelings of my people have conformed.

"I feel assured that it will be our common object in supplying that which may be defective, or in renovating that which may be impaired, to strengthen the foundations of those institutions in Church and State which are the inheritance and birthright of my people, and which, amidst all the vicissitudes of public affairs, have proved, under the blessing of Almighty God, the truest guarantees of their liberties, their rights, and their religion."

FRANCE.

THE excitement occasioned by President Jackson's angry message on the United States' claims on France has been succeeded by the anger and astonishment arising out of some not very well understood claims put in by the Emperor of Russia on behalf of the Grand Duchy of Poland, which country Nicholas now treats in all things as an integral part of Russia.

The French are stated to have incurred this debt under Napoleon, when, from the treaty of Tilsit, in 1807, down to 1813, his troops held Warsaw, the capital, and other places in the Polish Duchy. France, however, has claims to set off against these; and on the 23rd of January, when the subject was introduced in the Chambers, Admiral de Rigny, the minister for foreign affairs, said that great exaggeration prevailed as to the amount of the Emperor Nicholas's claims, and hinted that the balance would be in favour of France. On the 26th the debate was renewed. M. Odillon Barrot contended that all these claims had been set at rest for good by the convention of 1818; and M. Isambert insisted on the same point, adding that it would be a mockery to pay over an indemnity due to Poland to the Russians, the enemies and oppressors of Poland. The ministers, Admiral de Rigny and M. Thiers, got rid of the first objection by stating that an additional article in the treaty of May, 1814, excepted the Duchy of Warsaw from the general settlement of the claims and responsibilities of France, and repeated that, on examination, not France, but Russia would be found the debtor. The House did not divide upon the question, but passed to the order of the day. The wrath and alarm on this head, which some of the French papers laboured to render very important, seem to have arisen merely from popular antipathies, and a hatred of the name of Russia. A few days after, the receipt of American papers removed all apprehensions of a maritime war for the present. The Committee of Foreign Relations, in the House of Representatives, had, in their Report, modified the severity of President Jackson's Message, and shown every honourable inclination to postpone having recourse to measures of violence against the French. The Committee agreed with the President that the claims of the United States on France were just, and that the delay of their payment was a hardship to the nation; but, at the same time, the Committee believed Louis Philippe to be sincere in his intention of discharging the long-standing debt, and recommended that the American Government should wait a little longer. "On the whole," they said, "the Committee are of opinion that the time has not yet arrived when Congress is called upon to go into the consideration of the very serious question, whether they will enter into any measure for the purpose of taking into their own hands redress for wrongs by France. The Committee are of opinion that Congress ought to avoid any resort to war, or to measures which may lead to it, and rather wait to see the result of the exertions which the French King is undoubtedly making to carry the treaty into full effect."

The Chamber of Commerce at Lyons has energetically urged upon the French Government the justice and neces-

city of paying the Americans the twenty-five millions of francs they claim. It states that Lyons will be ruined if war ensues between France and America, which is the greatest foreign purchaser of Lyonnese and other French manufactures. The silk trade of Lyons alone is said to derive upwards of forty millions of francs per annum from the Americans.

The Chamber of Deputies have ordered the printing and publishing of the documents connected with these American claims: they form two volumes, and according to some persons, go to prove that the amount cannot fairly be so much as twenty-five millions, and that the commercial advantages secured to France by the Louisiana treaty of 1803 have always been withheld. It appears, however, that the Chambers will pass the Bill for paying the claims as they now stand acknowledged by the treaty signed by the Duke de Broglie and General Sebastiani.

The Deputies have been occupied with long discussions on petitions presented to their Chamber, praying for an extension of the elective franchise, a wholesale parliamentary reform, and the abolition of oaths of allegiance, and all political oaths, which are now laughed at, while they are taken, in France. After an animated debate on these several points, the majority passed to the order of the day, and so left the representation of the people as it was established by the revolution of July, and the political oaths as the same laughing-stock they have been for half a century.

The crown-monopoly of tobacco, which the Government of France, in common with those of many other continental, but less constitutional states, retains in its own hands, has long been highly unpopular to the nation; and men's minds have been much irritated at seeing that several of the persons who rose to power through the revolution of July, and who had both written and spoke against the monopoly, have since supported that abomination. The subject has been several times before the Chambers. The monopoly gave a large annual sum to the treasury, and ministers were not prepared to supply the deficiency by other duties or taxes. On the 16th of February, however, being compelled to divide the House on the question of the tobacco monopoly, they were defeated by a large majority; and the monopoly, though not abolished by these votes, is to be submitted to an examination and strict inquest, which, it is supposed, will lead to an abolition, and place good cigars and snuff within the reach of Frenchmen. It is scarcely necessary to say, that all over the Continent where the monopoly obtains and governments are tobacconists, both snuff and cigars are very bad. The tobacco committee appointed by the deputies is anti-ministerial.

Fresh prosecutions of the press have taken place; and the peers continue their long labours introductory to the state trials. The ultra-royalists have, almost to a man, joined the ultra-liberals, in petitioning for the pardon or acquittal of the republican prisoners.

It is very probable that the King and his cabinet are not conducting these matters in the best of all possible ways; yet we cannot see how they could, either in justice or prudence, grant an amnesty to *all* the desperate men under arrest. The mere terms "political offences" have an unpopular, suspicious sound to English ears; but it should be remembered that, on this occasion they are, in the great majority of cases, applied not to mere speculative opinions, but to overt and bloody acts,—to men who either fought in the streets of Lyons and Paris, or urged others to fight—to individuals who, during the last three years, have caused incalculable injury and misery to their country—and who, by their open declarations against the rights of property, and repeated attacks on all the better feelings of humanity, have thrown themselves without the pale of civilized society. If they are let loose unscathed, what guarantee is there that they will not return to do what they have already done? An instance of the untameable spirit that animates the mass of these desperadoes has lately occurred. Louis Philippe pardoned a number of republican prisoners in Mont St. Michael: they were scarcely beyond the walls of that castle, when they began to sing the Marseillaise, and to shout "Death to the Juste Milieu!" "Long live the Republic!" They then repaired to a kind of public-house, and assuming the form and ceremonies of a Jacobin club, drank the most revolutionary toasts, and pledged themselves to do again all they could, and to go to the utmost lengths against the established government.

General Sebastiani has succeeded Prince Talleyrand as ambassador to England; and Count Pozzo di Borgo, being removed from the Tuilleries, now represents the Emperor of Russia at the court of St. James's.

Since the above was written, intelligence also has been received of the resignation of Mortier, Duke of Treviso, the President of the Council, and Minister of War. Soult has been sent for by the King, and he is said to have made him an offer of the vacant office.

SPAIN.

In consequence of the slow progress of their arms in the provinces of the north, and the military insurrection at Madrid which we mentioned last month, the Spanish Cabinet has been a scene of trouble and altercation, and the Cortes of passionate debates that seem to have led to nothing.

In the Procuradores the opposition raised the usual Spanish cry against the Camarilla, and the favourites and men of intrigue that rule the young Queen Regent and misrule the kingdom. They called upon General Llauder, the Minister of War, for a fair and open exposition of the state of the army. The General indignantly replied, that he knew of no Camarilla—that *he* had done his duty—that long ago he had suppressed insurrection and disarmed the Carlists in Catalonia, where he then commanded, and had left behind him a strong, well disciplined, and disposable army. He added, that if good use had not been made of that army, the fault rested with Mina and others, but not with him. The main facts, we conceive, admit of no doubt, but the manner in which they were delivered rendered it equally evident that Llauder and Mina could not agree, or act together with the good feeling and understanding that are indispensable at this crisis. The debates were continued for several days. On the 20th of January, the opposition expressed their dissatisfaction at the explanations offered by ministers, and broadly accused Llauder of a want of decision, talent, and good management. They pretended to make out their case, not only from the unsuccessful conduct of the war in the north, but from his own personal conduct during the recent mutiny at Madrid. They were successful in these attempts at getting rid of Llauder, but we can scarcely see a man among them likely, under present circumstances, to do much more good as a minister of war than he did. On his resignation Llauder immediately left the capital and repaired to Barcelona, where, it is said, he will resume the Captain-Generalship of Catalonia. Insulted and outraged as he has been by the Cortes, there may be danger in leaving him with such a command in a province that has always been too much disposed to revolt and insurrection; but to deprive of the command and further disgrace Llauder, who is a favourite with a large part of the army, may be quite as perilous. Reports have been industriously circulated, that this General has lost his senses. Judging at a distance, however, we should scarcely say that he has shown more signs of insanity than his colleagues in office, or than those who opposed him in the Cortes. Spain stands miserably in need of great and wise men—not mere men of theories or flashy orators, but men of experience and of action. She requires, as the only medicines that can save her, or rescue this her latest constitution from the grave of the Cortes of 1820, a sobriety of thought, and a union, at least, of the liberal factions; but as yet, we regret to say, these wants do not seem likely to be supplied to her very soon. Although we should deplore the blood which would inevitably be shed in such a case, the best chance for Spain to settle down into something lasting—to retrieve her national character and recover the energies that have been destroyed by two hundred years of supineness and execrable misgovernment and tyranny—would be to fight out in her own bosom the numerous quarrels that agitate and divide her. But she will not be allowed this opportunity. One of the two conflicting sentiments of Europe—despotism and liberalism—*must* (unless she make great haste) decide the question for her, though not in a national or lasting manner. At this moment she depends on mere accidents and chances—on the humours of kings, and the changes of cabinets in England and France.

General Valdez is spoken of as the successor to Llauder. General Bellido has succeeded to the command of the Captain General Cantara, who was killed during the mutiny of the regiment at Madrid. The Queen Regent, assuming to herself the power of breaking the capitulation concluded

with that turbulent regiment, has disbanded it, and punished some of the ringleaders.

The difficulty we have so often alluded to, of obtaining anything like correct information from the seat of war, continues to be as great as ever. Each party represents itself as being constantly victorious, and has its organs and reporters, its bulletin-makers, and, we suppose, its dupes. It is quite clear that on neither side is the war carried on with vigour and spirit, and it is equally evident that the correspondents and news-gatherers despatched by our journalists, send home accounts to suit the politics of the particular papers that employ them, and do not see into, or understand the subject at large. There are exceptions, but, generally speaking, the education and intelligence of these men are on a par with their honesty. While the French paper, 'Le Moniteur,' publishes a telegraphic despatch, importing that the Carlists have lost ground, and been obliged to retire with loss from before Elisondo, to which they had laid siege, certain bulletins, got up with an air of officiality, assert that the Don is everywhere successful, and that his general, Zumalacarregui, has gained a splendid and complete victory over the Christinos at Arquijas. It should seem that Don Carlos is careful not to expose his own person to the hazards of war; and that on this, as on every other occasion, he merely looked on the battle from the summit of a conveniently distant hill.

Meanwhile it is pretty positive that considerable numbers of the Queen's troops are gathering at Burgos, whence they will march to re-inforce Mina, who, in spite of many reports to the contrary, still retains his command. To supply this force the capital has been almost entirely deprived of its garrison of regular troops. This circumstance, however, seems to occasion no alarm. The Urban militia, composed of private citizens, and on which complete confidence is everywhere placed by the Queen Regent and the Constitutionalists, are to mount guard at all the important posts, and do the garrison duties of Madrid.

The Carlist faction have sustained a great loss in the death of that Guerilla priest, the notorious curate Merino. He was neither shot nor hanged, but died quietly in his bed at the end of January last.

Preparatory to their adjournment and return to their respective provinces, the Procuradores, or Lower Chamber of the Cortes, have voted an address to the Queen. The document is rather curious. It dwells on the constitutional and other political improvements they (the Procuradores) *intend* to make; and it does not go into the critical question of the civil war in the north.

The negotiations for recognising the independence of the New South American States, to which General Jackson alluded in his message to Congress, and of which we spoke last month, are carried forward with some activity at Madrid.

PORTUGAL.

It has been reported, on the strength of the encouragement held out to him by the return of his friends the Tories to office, that Don Miguel has secretly left Italy and returned to renew the civil war with his niece. The news, however, was premature, and the Don seems to be quietly waiting events, and a more decided turn of affairs, at Genoa, or some place in the neighbourhood of that city.

The debates in the Chambers have been vehement, and the people in the galleries have now and then taken part in them, hooting the Duke of Palmella, crying out, "Down with the Ministers! Death to the Traitors!" and the like. Lisbon, however, has remained pretty tranquil, and the provinces are more orderly than they were. The Minister of Finance, Silva Carvalho, has produced his financial statement, which is not unsatisfactory, provided always, that Brazil do not disappoint Portugal in the payment of certain debts, and Portugal *do not encounter difficulties in selling the confiscated church property, &c.*

The Duke of Leuchtenberg, or, as his title now goes, the "Prince Augustus of Portugal," whose departure from England we mentioned last month, arrived safely at Lisbon, where his marriage with the young Queen Donna Maria was celebrated with some splendour. He is said to make use of all rational means to conciliate the affection or good will of his wife's subjects, and to be brave and accomplished, polite and popular in his manners. His father, Eugene Beauharnois, was all this, and, considering the school in which he was brought up, an honourable and kind-hearted man besides.

The heart of Don Pedro, as directed by his will, has been carried in a steam-boat to Oporto, which he considered the scene of his glory and patriotism. The garrison of Lisbon fired a salute as it was embarked.

Prince Augustus has taken his oath and his seat as a member of the upper chamber of the Cortes, in virtue of letters-patent granted by the Queen his wife.

ALBANIA.

An insurrection has broken out among the fierce and lawless people of this country, which is generally described as being more serious and determined, and as having a more decided object than any one of their innumerable revolts against the Turks since the days of Scanderbeg. It is said that all their clans, which in many respects resemble our Highlanders of a century and a half ago, after making up their separate feuds, have come to the general determination never to lay down their arms until they have rendered Albania wholly and for ever independent of Turkey. They have occupied Perali, taken Argyro-Castro, and sent on two chieftains with imposing forces to threaten Janina, the first city in the country, and so long the capital of the famous Ali Pacha. Their lines of march are everywhere marked by fire and ruins, and, with their usual barbarity, they slaughter all who offer any resistance, or show any ill will to their cause. A certain Taphil-Muzis, who is at the head of six thousand men, is named as the most conspicuous of the insurgents. This will be another fatal blow to the doomed power of the Sultan. A war in this rugged, mountainous country, against men who, though undisciplined, are exceedingly brave, and expert in the use of their long guns and rifles, has always been attended with great risks and difficulties; and, from his recent impoverishment, we may suppose that Mahmoud can no longer command the treasures with which, on former occasions, he was accustomed to buy over the Albanians, corrupt their chiefs, and introduce jealousies and dissensions among them.

The Albanians have little in common except the partial and dubious profession of the same faith, with their neighbours the Greeks, whose tranquillity they are now likely to disturb. They differ in race and language. The Albanians are an off-shoot of the great Slave or Sclavonian family, and they speak a dialect of the Sclavonian tongue not much unlike Russian. Some of their tribes pretend to be Christians of the Greek Church, while others profess the Mahometan religion; but either of these faiths hangs loosely upon them. In districts in Turkey, where Christians and Christian churches predominate, we have seen the Mahometan Albanians go regularly to church; and in other parts of the country, where the Turks are more numerous and churches scarce, we have seen the Christian Albanians go very composedly to mosque. In personal appearance (to turn a French phrase to our purpose), "they are more Greeks than the Greeks themselves," *i. e.*, generally speaking, they are more like what we fancy the Greeks of the heroic times to have been, than are the Greeks of the present day. Their figures are cast in the finest mould, and but for an expression of mingled treachery and ferocity, their countenances would be equally admirable. Of civilization, or discipline of any sort, they have scarcely an idea.

The German papers have contained letters written from the Ionian Islands, and Albania itself, stating that the insurgent chief Taphil has listened to amicable terms proposed by the Sultan; but unless the Ottoman Empire be reinvigorated, these turbulent clans will never be quiet for twelve months at a time.

GERMANY.

The great powers that impose their will as law on the smaller states (incorrectly called *independent*) continue to affect an alarm at a revolutionary spirit which is nowhere declared.

Pretending to be offended at certain reports of conspiracies that have lately appeared in different journals, the Diet has declared that every newspaper so offending in future, shall be seized and suppressed. The Diet avows that this summary measure has been adopted in compliance with measures recently entered into at Vienna. The works on

works, which have been so long talked of, have at length been prosecuted with some activity. It is said, consequent hopes are now entertained that the river may be rendered navigable for large craft from its mouths on the Black Sea to Vienna, and still further.

The German papers have contained numerous accounts of fires in the villages of Hungary, the cause of which they do not pretend to assign. One of these journals gives the following particulars relative to the new commercial league, or German Custom-house Union, which we believe are mainly correct.

"The territory of this Union extends in the direction from north-east to west, from Memel (37° long.) to Aix-la-Chapelle (23½° long.); and from north to south, from Stralsund (54½° lat.) to the frontiers of Austria, below Munich (24½° lat.), and contains a superficies of nearly 8750 square miles (German). The following, in round numbers, is the population of the countries which compose the union:—Prussia, 13,200,000 inhabitants; Bavaria, 4,000,000; Wurtemburg, 2,000,000; Saxony, 1,300,000; the Saxon Duchies, 600,000; the Grand Duchy of Baden, 1,100,000; the Principality of Nassau, 350,000; the Duchy of Hesse Cassel, 600,000; the Duchy of Hesse Darmstadt, 700,000; the free city of Frankfort, 60,000; the other small States, 590,000; total, 24,500,000. The following German States have not acceded to the Union:—Austria, 10,000,000; Hanover, 1,500,000; the Duchy of Brunswick, 250,000; the Duchy of Oldenburg, 250,000; the Grand Duchy of Mecklenburg, 500,000; the Duchies of Holstein and Lauenburg, 400,000; the three Hanse Towns, 250,000: total, 13,150,000."

DENMARK.

Even the honest Danes, who are rarely or never heard of in the turmoils of politics, have recently shown a disposition to limit the absolute power of their king, and correct sundry abuses that have crept into the government.

Previously to 1660 the sovereign was elective (the worst of all forms of monarchy) and the country had a constitution which was viciously aristocratic. Disgusted by the tyranny and insolence of the nobles, the two other estates, or the clergy and the commons, availing themselves of favourable circumstances, and of the popular heroic character of the reigning sovereign, Frederick III., made head against the aristocracy in the Diet which met on the 8th of September, the last Diet that was ever convened in Denmark. Not contented with reducing the excess of power and privilege of the nobles, and with making the throne hereditary, the churchmen and the burghers consented in declaring the power of the king to be absolute, and his right to the throne a divine right. In the programme to their constitutional alterations they broadly asserted "the hereditary kings of Denmark and Norway shall be in effect, and ought to be esteemed by their subjects, the only supreme head upon earth; they shall be above all human laws, and shall acknowledge, in all ecclesiastical and civil affairs, no higher power than God alone. The king shall enjoy the right of making and interpreting the laws, of abrogating, adding to, and dispensing with them. He may also annul all the laws which either he or his predecessors shall have made, excepting this royal law, which must remain irrevocable, and be considered as the fundamental law of the state. He has the power of declaring war, making peace, imposing taxes, and levying contributions of all kinds, &c. &c."

In these extreme measures the commons went much further than they had at first intended, but they were provoked by the obstinate opposition of the nobles—an opposition urged against all and every change—and thoroughly duped by a party sold to the Court. The leaders of the Court intrigue were Svane, a bishop, and Nansen, the Speaker of the Commons.

Seeing that force was about being resorted to, a few of the nobles left the Diet, and fled from the capital. The king then commanded the gates of Copenhagen to be shut, to prevent any more escapes; on which the remaining members of the aristocracy, caught as in a trap, gave up their resistance, and concurred with the clergy and commons in their creation of an utter despotism.

The whole business occupied only four days; and the order of things that resulted from it has been ever since maintained in Denmark.

By a good fortune, on which no nation ought to count, it has happened that the absolute sovereigns of this country have been generally good and sensible men, and have seldom abused the power vested in them. Now, however, the prince who stands next in succession to the throne is described as being a person of vicious habits, and a violent and tyrannic temper;—some say he is only mad.

This prospect has probably produced a certain influence on the industrious, quiet, and patient Danes; but another circumstance must also have had some effect. A year or two ago the reigning king, Frederick VI., convoked an assembly of the three estates, in order, it was rumoured, to prepare a representative constitution. From that time, the newspapers assumed a bolder tone; and the king, like his brother potentates in Germany, is now engaged in an inglorious war against the journalists.

The temper, moderation, and enlightenment of the great body of the people are described as admirable: in its good and proper sense, the schoolmaster has been abroad among them. From all that we have seen and known of the Danes, we should think there are few people less likely to abuse the privilege of liberty.

A treaty was concluded a short time since, in which the King of Denmark engages to join his strenuous efforts with those of France and England, for the entire suppression of the negro slave trade.

PERSIA.

As we fully expected when, in our January number, we announced the death of the old king, Futteh Ali Shah, a host of claimants arose to dispute the crown with Mohammed Mirza, grandson to the late Shah, who appointed him his successor. The breath was scarcely out of the old man's body, when many of his sons (who are altogether some thirty in number) rushed to the body to seize the diamonds and rich jewels he wore upon his person, or had near him. A conflict ensued, in which three of these princes are said to have been killed. One of the sons, contriving to get possession of the old Shah's treasury, which enabled him to pay his partisans, caused himself to be proclaimed at Teheran; another of them declared himself king in the province of Schivas; a third did the same at Kermanshah; and an ex-minister collected troops, and began to fight on his own account.

The young Shah, Mohammed Mirza, was, however, supported by the entire body of the disciplined regular army, and (which was, perhaps, still more important) by the diplomatic agents of England and Russia, and a foreign loan.

By the latest intelligence it appears, that though revolt and carnage were not wholly suppressed in the south of Persia, the different pretenders have felt themselves compelled for the present to submit to their nephew, Mohammed Mirza. The speedy termination of a civil war is attributed almost entirely to English and Russian diplomacy; but travellers who have lately visited the country consider it impossible that peace can be of any long duration. Persia is so disorganized and impoverished, and the national spirit is so low, that it is likely to remain a mere table for England and Russia to play their cards upon. The game is a serious and difficult one. Persia has, indeed, more than once risen from an equally sad condition of debasement to military glory, independence, and conquest; but the young sovereign Mohammed is not likely to turn out a Nadir Shah.

CHINA.

In consequence of the changes introduced into the East India Company's charter, and the throwing open of the China trade, it became necessary to send out a properly qualified officer, who should protect the interests of the free traders, and endeavour to make amicable and more liberal arrangements with the Chinese government.

The ministry of Earl Grey gave this appointment of Chief Superintendent to Lord Napier, who arrived at Macao, in a British ship-of-war, the Andromache, on the 14th of July last year. No intimation of his appointment, it appears, had been given, either to the Emperor at Pekin, or the Viceroy at Canton. This omission is severely censured by certain parties at home; and it *does* appear curious that it should have been permitted to occur, while treating with a

government so absorbed in routine and etiquette as that of China. Even we ourselves, who are far from being over-ceremonious in such matters, would not receive an American consul at Liverpool, or a French consul at London, unless his appointment had been formally announced to our Foreign Office beforehand. But then it must be remarked, on the other side, that had Lord Napier waited at Macao until communications were made to the Chinese Court, and their slow answer received, some months must have elapsed, and that too at a time when his presence was most required at Canton. Indeed, from all we know of the Chinese, we are inclined to believe that such a correspondence might have been prolonged for years, and that at last the punctilious Mandarins would have refused to receive or treat with Lord Napier—ostensibly on the simple ground that China never had recognised such an appointment as his, and consequently never could, for her laws were unalterable—the force of precedents omnipotent on her government, who could only do what their fathers had done before them, &c. &c. Lord Napier may have known all this: and feeling he had important duties to perform, which could not submit to Chinese formulas and delays, he determined to push on at once to Canton, where, whatever high talk the Governor might indulge in, he might be quite sure he would not venture on any serious act of hostility.

The facts, as related in the newspapers, are these:—having made some arrangements and official appointments, Lord Napier, a few days after his arrival at Macao, proceeded to Canton. A deputation sent from Canton, to request him to remain at Macao until the Viceroy should receive the Emperor's orders from Pekin, did not arrive until Lord Napier had departed; and another party sent down the river to intercept him also missed him. In the interval, the Hong merchants, by the orders of the local government, had formally announced to the British merchants, that as their "honourable officer" would not act in obedience to the unalterable laws, they (the Hongs) could have no further buying or selling, or any kind of intercourse with their "honourable nation."

On arriving at Canton, Lord Napier despatched a firm, but respectful letter to the Viceroy. His letter was refused at the city gates, *because* its superscription was that of a *letter*, and not of a *humble petition;* and his Lordship was peremptorily ordered to quit the factory, which is situated outside of Canton, and return to Macao. On his part, his Lordship refused either to communicate with the Viceroy as a petitioner, or to leave the factory; and having called the British merchants together, he declared his intentions, and expressed his full conviction that matters would soon be amicably arranged. He spoke as one knowing the arrogant, yet timid national character:—

"The Andromache and Imogene, which I had ordered to sail on a short cruise," continued Lord Napier, "with a view of feeling the pulse of the Chinese (and that object has been attained, for they have since become more absolute), will soon return, and will operate, no doubt, on the Viceroy; and when the merchants form themselves into a Committee of Commerce, they will exhibit a more imposing attitude, and show the Chinese that the advantages were not altogether on their side. If, however, it was thought necessary, his Majesty's ships should come up to Whampoa; and if their presence there was not sufficient protection, they should anchor under the walls of the town."

According to his Lordship's advice, the meeting then adopted resolutions for the formation of a Committee of Commerce; and, it is said, expressed their conviction that the conduct of the Viceroy did not arise out of any hostility to the new free-trade system, or the object of Lord Napier's mission, but merely from a love of form and delay, and a desire to vindicate the offended etiquette of the Celestial Empire. It is curious to observe that this dignitary had not yet communicated to the Emperor the intelligence of the "death," as they call it, of the East India Company's monopoly of the China trade.

The consequence of this rupture has been the partial and temporary stoppage of the tea-trade, and the issuing of several singular, and, to us, laughable documents, signed "Loo, Governor of the provinces of Canton and Kwangse." With reference, we suppose, to his office as overseer or superintendent, he calls Lord Napier "the Eye;" and as his Lordship is not a subject of the Celestial Empire, but only a British nobleman, he, with true Chinese modesty and politeness, particularizes him as "the Barbarian." man who [illegible] come to the provincial [illegible] service, but helped to enhance report of the circumstances of coming [illegible] preceding administration want of decorum. I, the Governor, consider[illegible] was his first entrance into the inner dominions, and that he was yet unacquainted with the established laws, commanded the same merchants at that time to enjoin orders on him, and to inquire and ascertain for what he had come to the provincial city; that if it were that, on account of the Company's dissolution, it had become necessary to establish other regulations, he should immediately inform the said merchants, that they might make a report, so as to give me data for forwarding a memorial by the government post; and that the said barbarian eye should meanwhile return to Macao, to await the will and mandate of the great Emperor being received, and published, to demand obedience. Thus the business would be altogether managed in perfect accordance with dignified decorum, rendering change needless."

Since writing the above we have received the melancholy intelligence of Lord Napier's death, and a confused account of transactions which we cannot altogether understand. It should appear, however, that his Majesty's ships, the Andromache and Imogene, under the command of Captain Blackwood, returned from their short cruise, and stood up the estuary for Whampoa on the 7th of September last. A crowd of war junks got under weigh, but took good care to keep at a distance from our men of-war. As they approached the Bogue, or Bocca Tigris passage, the Andromache and Imogene were assailed by a fire from the Chinese forts, which was sustained most vigorously when the two ships were out of reach of their shot. The English reserved their fire until they were in the narrowest part of the passage and close to the paltry mud forts, when a broadside or two did their business, silencing them and scattering the panic-struck Chinese. The result was such as might be expected from the contemptible nature of Chinese fortifications, artillery, and ammunition, and the low state of Chinese courage. The best of their cannon are mere patteraros. They only killed one seaman, on board the Andromache, but sustained a heavy loss themselves. After silencing the forts, Captain Blackwood quietly took his ships to Whampoa, where the greatest consternation prevailed among the country people. Unfortunately Lord Napier was seized by a dangerous disease, which, with a difference of opinion that arose among the members of the British Chamber of Commerce, induced him to return to Macao, where he died on the 11th of October. Our men-of-war re-passed the Bogue and came to anchor at Linton Island, on which the Chinese declared all communications to be free and open to foreigners as usual, and took off their interdict on the tea-trade, which, five or six days after, was going on with great activity, the English being large purchasers of the new crop of teas.

Although, through the want of unanimity in the Chamber of Commerce, and the sudden illness of Lord Napier, part of our predictions as to the end of the quarrel has fallen to the ground, the rest will remain much as we have stated. The Viceroy, as all his predecessors have done on such occasions, will report a victory to the distant capital, but the Chinese Mandarins on the spot, who can see with their own eyes, will, for some time to come, be impressed by a salutary terror and respect. If the dignity of this country is to be maintained—if the free trade with China is to be anything but a mere name—the power and old-established influence at Canton of the East India Company must be checked, and a proper, independent successor appointed to Lord Napier. It cannot be expected that the old servants of the company should exert themselves in favo[illegible]

Vessels of War owned by the United States on the 1st of October, 1834.

* Flag ships on their respective stations.

Besides the above table, which includes the whole force of the United States' navy "afloat," another paper, accompanying the Secretary's Report, informs us that "five ships of the line and seven frigates remain upon the stocks in the different yards, all under tight houses, and in good state of preservation. They are so far advanced that they may be equipped as soon as crews could be collected for them." There are also many "valuable materials on hand at the several yards, belonging to this appropriation (namely, that under the acts of 1816 and 1821, already mentioned,) preparatory to the completion and equipment of the vessels; but the amount remaining in the Treasury (D.186,613 19) would be insufficient to supply the probable deficiency, as stated in a letter from the Board (of Navy Commissioners under the said acts) to the Secretary of the Navy of the 19th June last; but if the services of these vessels are not expected to be soon required, no immediate appropriations will be necessary for them."

It has been determined by the "proper authorities," to name the ships of the line which may be hereafter built after the several states. Thus, the five already completed, will be called the Alabama, the Vermont, the Virginia, the Pennsylvania, and the New York. Their frigates are to be named after rivers, and the St. Lawrence, the Savannah, the Raritan, the Columbia, the Sabine, the Lantee, and the Cumberland rivers, are to give names to the seven frigates now nearly ready for launching.

Another principle of naming is after captured ships. In 1832 or 1833 a frigate was laid down to replace the Macedonia; another is recommended to replace the Cyane, condemned. The Guerrière, also named after a captured ship, requires to be rebuilt. In this way is the "glory" of their naval victories handed down.

Rejecting, then, all those vessels which are reported as "unfit for sea-service," and "condemned," and taking into the account all those which "may be equipped as soon as crews could be collected for them," we have the following statement of the total force of the American navy:—

	In Commission.	In Ordinary.	On the Stocks.	Total.
Ships of the line	1	6	5	12
Frigates	2	3	7	12
Sloops of war	9	5	0	14
Schooners	6	0	0	6
Totals	18	14	12	44

In addition to the acts which we have quoted, and the results of which we have exhibited, Congress, in 1827, passed a third act for "the gradual improvement of the navy." This act expired in March, 1833, when it was continued by another, dated 2nd March. By these acts 500,000 dollars are annually paid out of the money in the Treasury, not otherwise appropriated. This sum is devoted partly to the purchase of timber prepared for the construction of vessels, and partly to the building of two dry docks. The first act also authorised the construction of steam-vessels of war, but at present no steps have been taken to carry that provision into effect. The Report states, however, that "it is intended to make early arrangements for procuring materials for steam-vessels authorised by the act, the Board having hitherto delayed action upon this subject, for the purpose of procuring information on some important points." Notwithstanding this neglect of the provisions of the act, which relate to the construction of steam-boats, the Americans are fully alive to the important revolution which will, in all probability, be effected in the course of a few years in naval tactics, by means of the introduction of steam-vessels of war.

"Should the power of steam,"—says the Report of the Secretary, p. 312—"as a means of defence, produce all the effects that may be justly anticipated, it will diminish, in some instances, the necessity of permanent fortifications on the coasts, by substituting those which may be moved from place to place as they may be wanted, and in our own waters become the formidable engines of attack as well as defence. The heavy and cumbrous steam-vessels and batteries, with their necessary apparatus and supplies, which may be brought into action with the most powerful effect by a nation near its own shores and harbours, cannot be transported over distant seas and oceans for the purpose of attacking its enemies. Should, therefore, the application of steam become a part of the system of maritime war, it is a consolation to reflect that it will greatly diminish the frequency as well as the horrors of such war, inasmuch as it will hold out much greater advantages to the defending than to the attacking party, and take from the aggressor, in a great degree, his hope of success, and, of course, his motive for action."

Inasmuch, however, as steam-boats may be built light and speedy, as well as "heavy and cumbrous," it does appear to us that they will answer the purpose of attack as well as defence. Every one knows the damage capable of being done to a superior force by a fast-sailing privateer, with long guns. Such vessels keep out of harm's way themselves, and sneaking, as it were, along the surface of the water, they wound their bulky adversaries in the most vulnerable parts. Introduce steam-ships of war, and the broadside of a line-of-battle ship would be robbed of its terrors. The last section of the second act has for its object the protection of the live-oak growing on the public lands. This object is deemed of extreme importance by Congress.

In conformity with the provisions of these acts, "Live-oak frame-timber has been delivered, under contracts, at the respective navy-yards, as follows:—At Charlestown, Massachusetts, for two ships of the line, two frigates, and one sloop of war; at Brooklyn, New York, for one frigate; at Philadelphia for two frigates, and one sloop of war; at Washington for one frigate, and one sloop of war, together with

part of the frame for another sloop of war; at Gosport, Virginia, for two ships of the line, one frigate, and one sloop of war; at Portsmouth, New Hampshire, part of the frame-timber of a frigate and a sloop of war."

Besides the above frame-timber, the Report announces a considerable stock of live-oak timber, white-oak timber, white-oak, and other plank, in the several navy-yards.

Thus, in addition to the vessels which we have enumerated as "afloat," and on the stocks, there is a provision for the construction of four ships of the line, eight frigates, and six sloops of war, making the whole force, capable of being rendered available within a moderate period, and at a moderate expense:—

16 ships of the line,
20 frigates,
20 sloops of war, and
6 schooners; in all,

62 vessels of war,

only three of which, namely, the frigates 'United States,' and 'Constitution,' and the sloop of war, 'John Adams,' were in existence previous to the breaking out of the last war in 1812.

In rating her vessels of war, America has adopted the exploded custom of the European maritime nations, by greatly understating the strength of her ships—the number and weight of the guns which they carry. Her line-of-battle ships are all rated as seventy-fours, her frigates as forty-fours, and her sloops of war as eighteens. There is no doubt but that this policy proved advantageous to America during the last war with this country, but it is equally certain that it will deceive no longer. Basil Hall says, the Americans calculate, that although European nations may construct ships of the same strength as those of the United States of America, to be used in any future conflict, that, nevertheless, the said European powers having a large number of small-class vessels, they must of necessity fall an easy prey to the powerful frigates of the United States! It may be allowed that some reliance may fairly be placed by the Americans upon the ignorance of the Admiralty officers of European nations, where they are appointed rather for their family connexions than for their aptitude for the duties which they are called upon to perform. Still it must not be forgotten that a long peace has placed the naval policy of each nation most completely within the cognizance of all other nations; and in the unfortunate event of future wars, the chances of success from what may be called mere trickery will be tolerably equalized. It is scarcely to be expected that an administration in 1830 odd would imitate that of 1812, by sending English oak frame-timber to the Upper Canadian lakes, and iron shot to an iron country, 200 miles over land, at a most enormous expense. In short, the more the equality of nations is made known to each other, the less will the probability of quarrelling become; and when we consider the conviction which is gaining ground, that war is an unrequited evil, peace an unalloyed good, we trust we may consider the chances of war at *zero*.

We are not possessed of any document which will enable us to place before our readers a statement of the actual strength of the vessels of the United States. We can only state in general terms, that their ships of the line, rated as 74's only, vary from 90 to 140 guns; that the weight of their guns is greater than that of the ordinary run of English and French ships; and that, lastly, their ships are remarkable for their great strength of construction. We have a statement of the 'Delaware,' taken from an American newspaper about the time of her departure for the Mediterranean station, where she is now the flag-ship. She is pierced for 100 guns, though in time of peace mounted with ninety-two only; namely,

On the lower deck 32 long 42 pounders.
.. .. main deck 32 .. 32 .. ..
.. .. upper deck 28 .. 42 .. .. carronades:

her compliment of men is 680, besides 100 marines.

The frigates of the United States are above their rating in a greater degree even than the ships of the line. Indeed, in point of tonnage and weight of metal, some of the larger class have been deemed equal to our old seventy-fours.

Before concluding, we may say a few words on a question which the Americans naturally view with the utmost solicitude—we mean the capability of America to man a navy. The present naval force of the United States, consisting of commissioned, warrant, and petty officers, seamen, ordinary seamen, landsmen, and boys, amounts to 6,072 in number; and the Marine corps, comprising officers, non-commissioned officers, musicians, and privates, number 1283, making in all 7,355. With this force nineteen ships of all classes are manned, and the several receiving ships at the navy-yards, and the ships in ordinary, are furnished with their quota of men and officers. To place their whole navy of forty-four ships in a perfectly efficient state, would thus require an addition of some six or eight thousand men.

Impressment does not exist in the United States of America: it is contrary to the spirit, as well as the letter, of their written constitution, to compel any man—that is to say, any white man—to follow any course of life which is not agreeable to him. They do not resort to so clumsy an expedient as *force* in procuring men for their naval service; they go fairly into the market and bid against the merchant ship-owner; and, as the service is popular, they generally fill up their numbers at a rate of wages lower than the average rate paid on board of merchants' ships. This is not surprising. The work—except during engagement—is not hard, whilst the merchants' seamen in blowing or squally weather have really no rest. On board of "a public ship," the watch, comprising never more, and sometimes less, than half the ship's company, can, and actually does, work the ship in all weathers, excepting, of course, in case of some extensive accident. On board of a merchant's ship, all hands are called to reef a topsail even, and with all hands it is a long and laborious job. Again, when in port, the situation of a man-of-war's man is one of ease, pleasure, and, too often, of dissipation. A reasonable, and, occasionally, an unreasonable degree of liberty is allowed them, while the merchant's seamen have to labour hard in receiving and stowing the cargo, under the scorching sun of Sierra Leone perhaps, or amidst the chilling blasts of the river St. Lawrence, with little liberty till the ship terminates her voyage. Every sailor's story-book tells us of the pleasures of roaming in foreign climes; and there is no doubt that the change of scene, incidental to a ship of war on a foreign station, makes up one of the reasons which permit the Secretary of the American navy to tell us that "the service is popular." Besides the seductive effects of moderate labour, the superior comforts in food, clothing, space, and cleanliness, on board of a ship of war are conspicuous. In a merchant's ship, every cubic foot occupied by "the people before the mast" is grudged by the cupidity of the owner as space into which a cotton bag or a hogshead of sugar might be stowed; whilst the ample room, airiness, and not only opportunities of, but obligation to, cleanliness, also adds much to the health and comfort of the man-of-war's men; and we may add, from conversation with English sailors who have served in American frigates, that they fully appreciate these advantages, and notwithstanding the somewhat severe discipline, greatly prefer the public to private service.

In the event, then, of the United States being engaged in a war, as there is nothing in the service itself to throw a difficulty in the way, the easy manning of the navy would principally depend on the capability of their "nursery for seamen," the general and coasting trade, and the fisheries, to furnish the necessary number. The registered, enrolled, and licensed tonnage of the United States for the year 1831, the latest account in our possession, amounted to 1,267,846 tons. The total tonnage of the British empire, in 1833, amounted to 2,634,577 tons, so that the American "nursery for seamen" is about half as large as that of Great Britain. While Englishmen have no fears as to the power of Great Britain to man two or three hundred ships of war by means of "brute force," how can doubts exist as to the power of America to man forty or fifty ships by means of a fair and mutual contract of wages for service? The enormous force which Great Britain employed during the last war with France, necessarily threw difficulties in her way which will not again be experienced; yet she was able to overcome those difficulties by the employment of an engine which is certainly less calculated to accomplish the end than the means to which America resorts.

Some American travellers, who have touched on the subject, have laid great stress on the popularity or the unpopularity of a war, as influencing the facility with which the navy of America might be manned. It appears to us that this consideration may be dismissed, and for this reason—that the American people, by their direct and perfect

control over their legislature, by means of annual elections, must be considered as the willing makers of every war in which they are engaged. The facility of manning a navy would, however, be materially affected by the nation with whom they were at war. The American mercantile marine is at the present moment a nursery for British seamen. In the event of a war with Great Britain, a portion of these would be influenced by the ties of country, and abandon the American service. In the event of impressment being again resorted to by Great Britain, that portion would perhaps be small, but at all events it would be something; should we, however, abandon that unskilful mode of manning a fleet, and compete with other bidders in the market, there cannot be a doubt but that the natural ties of nation would prevail, and America would lose some of her ablest seamen. If, on the other hand, the quarrel were with one of the European continental powers, the tie of language would prevail above all others, and not only would the British seamen now employed in American ships enter into the public service, but the mercantile marine of Great Britain would become a "nursery for seamen" for the service of the United States.

PRUSSIAN COMMERCIAL POLICY AND GERMAN TRADE-LEAGUE.

DURING the last forty-five years, Germany has been making great progress towards a system of consolidation and unity; and the notion of many of her writers and scientific men, though not always very clearly expressed, now seems to be, that the great German family ought to be placed under two classes and governments alone; *i.e.*, the Austrian empire in the south, and the Prussian kingdom in the north. By the accomplishment of such a measure, the political strength of the country would be greatly increased, and many other advantages obtained; but we can hardly see how it can be accomplished, except by force and the spoliation of the dynasties of the weaker states; and until Prussia and Austria show some symptoms of improving liberality, we should regret to see any of the partially free and constitutional governments, or indeed any of the states, be their form of government what it may, swallowed up by them.

It seems to us, that the commercial policy pursued by Prussia tends in this direction; and that, after having imposed her own system of trade and duties on all the north of Germany, and obtained the acknowledgment of her right to interfere in the internal and financial affairs of the so-called independent states, she will soon exercise as high an authority over them as Napoleon did over the Confederation of the Rhine. For the present, however, we are merely to consider this as a trade-question, and in so doing we will endeavour to treat it with impartiality.

No doubt, one of the great calamities of Germany, as of Italy, has been the dislocation and parcelling out of her wide territory into a number of small states. At one time there were three hundred separate governments; and even now, after many changes, and all the incorporations, fusions, and consolidations, effected by the Congress of Vienna, there remain thirty-eight states in Germany. Every state has or had its own laws, its own coinage, and its own custom-houses on its frontiers. Hence innumerable checks and difficulties are thrown in the way of trade, than which there were none greater than the delay and expenses at the numerous custom-houses. From their geographical position, certain of these states had to pay ten transit duties for the goods they imported or exported. To the poor merchant of the central territories, custom-houses were present whichever way he turned his eyes; and in many instances he could not carry his goods free of duty even five miles from his own doors. The Congress of Vienna gave some of its attention to these *douanes* that occurred at every step, and passed a determination, that the confederated German States should reserve to themselves the right of deliberating thereupon at the first meeting of the Diet at Francfort, and of concerting measures for facilitating the trade, navigation, and intercourse of one state with another. When the Diet met, nothing however was done. Some of the smaller states afterwards attempted to do for themselves what the Diet had neglected to do for the whole of Germany; and conferences were opened at Darmstadt, in between Bavaria, Wurtemberg, Baden, Nassau, and some of the smaller principalities. Their object was to establish a commercial association or league among themselves; but their views did not meet the approbation of certain of their powerful neighbours—they had no common strong centre round which to revolve, and no decided conformity and unity of plan among themselves; and thus the negotiations ended, in April, 1823, without any result.

The first essay had failed, but as the wish and necessity of some kind of union were imperative in those two states, Bavaria and Wurtemberg came to an understanding, and finally, in 1827, concluded a real commercial association with each other. By the treaty concluded on the 12th of April, 1827, and which was confirmed and extended on the 18th of January, 1828, the territories of the two states were to be united, and, as far as all merely commercial relations were concerned, to form but one state; their intermediate line of custom-houses being abolished. The tariff of the Bavarian custom-houses, as it affected other states, was accepted by Wurtemberg, and became common to the two countries. The product of duties paid in both states upon foreign goods was to form a common purse, which was to be divided, at the end of every year, between Bavaria and Wurtemberg, in proportion to the respective population of the two states.

Such was the first treaty of commercial alliance in Germany, which seems to have established the principles of these sorts of associations. The leading principles are—1st, a commercial union of different states and territories by the abolition of all intermediate lines of custom-houses; 2nd, the acceptance of a common tariff or scale of duties; 3rd a division of the product of all the customs received among all the associating states, each state receiving more or less according to the rate of its population.

Though some heart-burnings and dissensions might have arisen out of the principle that the customs should be so divided—for certainly all states cannot be consumers of foreign articles precisely in proportion to the number of their inhabitants; thus far, the contracting parties, and most of the other governments of Germany, looked with pleasure upon a system that seemed calculated to abolish the restraints that cramped their communications with one another, and to throw open the general internal trade of that great country. Nor had France, England, or the other non-Germanic nations any reason to dislike the uniformity of tariff, seeing that the duties it established were moderate, and that the states adopting it had no prohibitive views. But when Prussia entered upon the scene, and by degrees took into her own hands the direction of this commercial revolution, matters were considerably changed. The tariff, instead of being moderate, was generally exorbitant; and when she obtained its adoption, she certainly injured the minor states, and struck a blow at England and France, and the whole system of free trade, which does not mean a freedom of intercourse between some dozen of states huddled together in one corner of the world, but a liberty for the interchange of commodities all over it.

The advocates for Prussia, who argue in one page that her object is "the abolition of all prohibitions in respect to the productions of foreign industry, and their admission into Germany on payment of *moderate* duties," allow in the very next page that her tariff, which is to become the law of all northern Germany, *must* be onerous in order to favour the development of her national industry, and has justly and properly been made so severe, that it may be a practical method of convincing England of the unfairness and absurdity of her corn-laws, her heavy duties on timber and other foreign produce. They thus admit a fact which we are perfectly aware of, *i.e.*, that Prussia is making (as she has long been doing) extraordinary efforts to convert herself into a manufacturing country, and that she is animated by a spirit of retaliation towards England, and a resolution to set off one absurdity in political economy against another. We do not believe that a mischievous error in London is thus to be cured by the adoption of a similar mistake at Berlin; and then, if Prussia has grounds of complaint as to our duties on her corn, timber, &c. these do not hold good with many of the minor states, that export no timber and no corn, whose interest it would be to remain unshackled and enabled to buy good manufactures from England, France, &c. at a cheap rate, instead of inferior wares (for they have scarcely any manufactories of their own) from Prussia at a dear rate.

And then there is this material difference between Eng-

land and Prussia: our corn-laws, which are evidently a great stumbling block,* are an old error adopted in stormy and comparatively ignorant and narrow-minded times, and which, in spite of an obstinately conflicting interest, is every hour giving way to public opinion and superior enlightenment, that at no great distance of time will greatly modify or do away with the corn-laws altogether; but the restrictive system Prussia is forcing upon Germany is a new error, and one formed in good peaceful days, when the great principles of political economy are pretty widely diffused, and most people begin to detect and think of remedying the mistakes of their forefathers. From the very recent date of its introduction, the mischief has not as yet had time to take deep root, and it now might be easily remedied. But should Prussia persist in it for a few years, bolstered up by premiums and protecting duties, manufactories will be planted where nature never meant them to be, capital will be invested in them, the scheme will obtain that sanction which time and usage give to the most mischievous things in the eyes of certain interested parts of a nation, and with all her despotism, which one of her apologists considers an instrument "that has been singularly favourable to her development," she will find this policy an incubus most difficult to get rid of, and one even more oppressive to her and her dependants than our corn-laws have been to us.

The first step taken by Prussia was to conclude a treaty with Hesse, on the 14th of February, 1828. On the 17th of July in the same year, the Princes of Anhalt-Dessau and Anhalt-Coethen, whose narrow territories are *enclavés*, or surrounded on all sides by the Prussian dominions, gave in their adhesion, and agreed not only to adopt her tariff, *but to admit Prussian custom-house officers into their states to collect the duties payable under it.* It is also said by those who are unfavourable to Prussia,—nor have we seen the assertion contradicted by her friends and advocates,—that she has induced several of the other smaller states to submit to the same humiliation, and that even in the more powerful states of the league, the army of douaniers, though nominally the servants and subjects of the confederation at large, are nearly all Prussians. A few years ago, when the customs of the island of Sicily were farmed by a company of British merchants, the timid Neapolitan government took alarm on seeing the host of custom-house officers that was in the pay and under the control of those foreign speculators, and absolutely broke its contract with them before its term had expired. This was silly enough, but such apprehensions would not be altogether unreasonable in the petty states of Germany, whose douaniers are not under the temporary control of a body of private merchants, but nominated and paid by a great, warlike, and ambitious nation.

The projects of Prussia were not, however, carried without opposition, nor did she for some time declare the full extent of them. On the 24th of September, 1828, while the negotiations which were to bring over the conjoint states of Bavaria and Wurtemberg to the Prussian league and tariff, were pending, but not quite concluded, an association in self-defence was formed at Cassel, between Saxony, Hanover, Hesse-Cassel, Brunswick, Hombourg, Weimar, and several of the very small states, with the free towns of Francfort and Bremen. This association took the name of "*Mittel Verein*," or Middle Association. The contracting parties agreed,—1st, That during six years none of them should relinquish this commercial alliance, or treat with the Prussian or Bavarian league;—2nd, That every year the deputies of the associated states should hold a meeting for the despatch of business and the promoting the common interests of the alliance;—3rd, That they should improve the roads, lower their respective customhouse duties, and on no condition augment the existing transit duties, or do anything to embarrass the commercial relations of one part of the union with the rest;—4th, That the Kingdom of Saxony should be charged with the direction of the league.

The object of this intermediate union, whose principles seem to have been liberal and enlightened, was to protect their trade against the invasions of the Prussian and Bavarian leagues, and the rigours of the Prussian tariff, at the same time that it facilitated trading communications and an approach to a still freer system.

* After all her complaints, however, it appears that, spite of our corn-laws, Prussia exports about three times as much of her corn to England, as she does to all the rest of the world put together.

But Prussia, having swallowed up the Bavaro-Wurtemberg league in her own, proceeded with confidence and great skill to dispose of this "Mittel Verein," and to place herself at the head of one general association. The jealousy which some of the members of the "Mittel Verein" entertained of the ascendancy of Saxony seems to have contributed to the breaking up of that league; but the event was hastened by other causes.

The princes of Cobourg and Meiningen had the honour of being the first to renounce this alliance. For a '*pecuniary consideration*' they allowed Prussia a commercial road through their territories—agreed not to increase their low transit duties, and finally to adopt the Prussian system, to let out their customs to Prussia, and permit of their being collected by Prussian officers. By these secessions from the 'Mittel Verein,' Prussia came into possession of a free communication of roads with Bavaria and Wurtemberg, which was what she most wanted. In order to prevent the defensive association from falling to pieces, the remaining members entered into a new treaty in 1829, binding themselves to prolong their alliance to 1840, and on no condition to grant a free commercial passage through their state to any power, without the consent of the union. But the King of Prussia, having prevailed on the young Duke of Brunswick to refuse his signature, after having agreed to its conditions, the treaty was almost nullified at starting. The Duke let the indirect taxes, his customs and posts (which were to be collected by Prussian officers), for 45,000*l.* per annum, and became, like the rest, the mere vassal of Frederic William. Down to 1832 Baden refused to connect herself either with the Prussian or the central league, but she then veered round to the former, being defended in so doing by the pamphlet of a certain *vir doctissimus*, a Councillor of state of Baden, who asserted that the Prussian system was truly German, and *national* to every country of Germany which adopted it;—that prohibitions or high protecting duties were essential to guard the interests of the manufacturers in the interior against the competition of the English and French. The same dignified pamphleteer indeed admitted, that the accession of Baden to the Prussian league must have the effect of *singularly raising the price of colonial produce in the country*, but he did not regret this, as '*colonials are only articles of luxury.*' We will not dwell on the absurdity of calling by the name of *luxuries* things which (thank God!) have long ceased to be confined to the merely rich or luxurious classes, and which now, from long habit, have become necessary comforts to the working poor. A few centuries ago, a linen shirt was probably a luxury to this councillor of state's ancestors, but he will hardly venture to call shirts a mere luxury now-a-days. Men, it is true, spite of sundry unsightly disorders, which the use of linen and cleanliness have caused almost to disappear from among the people of Europe, might contrive to live on without shirts, and so they might without sugar and coffee, but most undoubtedly the health and comfort, and we will add, the virtue of the world, are vastly increased by these (in themselves) cheap indulgences, the production, preparation and exporting of which give employment to millions, and foster the exertion of millions on the other side, who must give, in some shape or other, production for production, labour for labour. If the patriotism of modern Germany is to be fed on old Spartan black broth, we confess we have no hopes for her.

With reference to this writer's particular and native part of Germany, coffee and sugar are now objects of first necessity for the people of Baden, where they enter into the daily nourishment of the simplest peasants. The learned councillor of state himself acknowledges that there, almost more than in any other state, these objects of consumption, in other times confined to the use of towns and cities, have extended to farm-houses and cottages, and spread themselves throughout the country and rural districts; and he also admits that the importation of sugar and coffee has been doubled within the last fifteen years of peace, prosperity, and (comparatively) free trade.

There are not wanting English writers who, fully determined to consider this arbitrary league as a mere temporary measure to hasten the repeal of our corn-laws, &c., and shutting their eyes to the plain expositions of it, made by the Prussians themselves, in which the necessity of strong and *lasting* protecting duties is insisted upon, profess the warmest admiration of the system—the child of 'the young vigour of Germany.' One of these gentlemen is excessively

indignant at another English writer, who has ventured to hint that Prussia, in imitation of France under the continental system, will push the cultivation of chicory and beet-root as substitutes for the coffee-plant and sugar-cane of tropical climates. Yet surely her rendering dear or *singularly raising the price of colonial produce*, tends in itself to a pseudo-production, though we are quite sure that the enterprise of the smuggler and the confirmed taste of the people, who can never be prevented from getting what they are so fond of, will defeat the chicory and beet-root speculators.

And here we may mention that a great abundance of pamphlets has appeared on this subject. We would rather see this or any other kind of battle fought out by types and the press than by muskets and sabres; but it appears to us that there has been very little fight shown on the present occasion, and that the partisans and paid writers of Prussia, and the adherents to the restrictive, anti-social system have had it nearly all their own way. The liberty of the press, always denounced as a damnable heresy in a large part of it, is now nothing more than a name in any one corner of Germany. It might be dangerous under an 'enlightened despotism' like that of Prussia, for a writer to combat or expose a system, on the carrying and enforcing of which the government has set its heart. It is due, however, to the general integrity and *bonhommie* of the German character, to allow that many of these writers may plead for the system from a sincere, though mistaken, conviction of their own intellects and consciences. The subject has been carried into the non-argumentative and lightest kind of their literature. We have seen, for example, allusions made to it, and complaints raised against their markets being overrun with English goods when Germany has manufactures of her own, in sundry of their modern novels and tales; and with the example of our own novel-writers before our eyes, we are quite ready to allow to the brotherhood across the Rhine the excuse of ignorance.

When Saxony seceded, the Middle Association was wholly broken up. How that enlightened and prosperous state, that had always been opposed to prohibitory enactments, and had felt within herself, and in a most sensible manner, the benefit arising from free trade, should have suddenly renounced her favourite system and so many advantages, appears to us a matter of difficult explanation; and the more so when we reflect that by the Elbe, the free navigation of which river was provided for by the treaty of Vienna, she had a high road for her exports and imports to and from the sea, Heligoland, and Hamburgh, which could not be seriously injured by such of the states on either side of the river as had adopted or might adopt the Prussian system.

The negotiations with the duchy of Nassau presented some curious points. In September, 1833, the French government concluded a commercial treaty with the Duke of Nassau. For a long time the Duke had earnestly desired a reduction in the French duties on the mineral waters of Nassau, known by the name of Seltz or Seltzer. As the sale of these waters forms a principal part of the Duke's particular revenue, he would have been much benefited in his own pocket by the facility of increasing it on the side of France. The reduction was agreed to, and the duty on the Seltzer waters put at 1 franc for 100 kilograms, instead of 5 francs 60 cents., as it formerly stood. In return for this advantage, the Duke engaged not to augment his duties, as they then existed, on French wines and French silks, during the five following years. This was, in other words, an engagement not to adopt the Prussian tariff. The treaty recited, that the preceding stipulations would cease to have effect if the reduction agreed upon should not obtain the sanction of the French Chambers during their next Session. This reduction was accordingly inserted in the ministerial Customs' Bill, presented to the Chambers, but the Bill was not discussed that Session through want of time.

As soon as the treaty of September was known, the Duke was assailed by the whole Prussian Association, which felt that a breach would be made in its system and circumvallation by the independence of Nassau. After remonstrances, complaints, and, it is said, threats, the Duke, conquered or convinced, seized the pretext which offered itself, and, under colour of the non-sanction of the French Chambers, declared the treaty to be thenceforward null and void. It appears, however, that the Duke has not as yet joined the League, though the Estates of his country have authorised him to do so. Perhaps the Prussian confederacy has not sufficiently tempted him on the head of Seltzer water and his own revenue.

As matters now stand, the Prussian League embraces the mass of northern Germany, with a united population of about 24,500,000. Not to mention Austria in the south, which has a system of its own already sufficiently prohibitive, the chief States which have refused to join the League are Hanover, Mecklenburg, Brunswick (which has detached herself from it), Oldenburg, Holstein, and Lauenburg, which, with some minor ones, may count a population rather short of 4,000,000. There remain, also, to be mentioned on the side of free trade, the Hanse or free towns of Frankfort-on-the Maine, Hamburg, and Bremen; but these towns are chiefly important as wharfs and depôts for goods, which could thence be shipped for export, if of German production, or sold and sent into the interior States if foreign. But the Prussian Association will now hem them in with custom-house barriers—they will be *porti franchi*, or free ports, only to themselves, and within their own streets and slips of territory; their united population of only 250,000 will not afford a very large field for commercial enterprise, and they will, in all probability, be finally forced or browbeaten into being what is called "integral members of the Union." Surely "the young vigour of Germany" ought to show more respect to what is old and truly venerable in the land, and to places so honourably connected with the early rise and spread of European commerce and civilization as the Hanse towns are. But, perhaps, in the eyes of Prussia, even antiquity can render nothing venerable, unless it be connected with monarchic institutions.

We must take our leave, for the present, of this important subject, with a few running remarks, which, for the most part, will be brief *resumés* of what we have already said.

We should be delighted to see one commercial frontier or line of custom-houses in Germany, instead of twenty, if that one frontier were established for the furtherance, instead of hinderance, of trade, and drawn for the benefit of all the States inclosed within it, instead of for the "system" or long-lasting caprice of *one*, and the inevitable embarrassment of all of them. We will go farther. We should gladly see the fusion of the many into one, and the consolidation of northern Germany into a powerful undivided State, *if* the head of that now openly contemplated Union had ever given any pledges (except such as he has broken) of granting to his own people the guarantee of a constitutional government.

In Prussia, as in all absolute monarchies, much, far too much, must always be personal, or dependent on the characters and intellects of a few living individuals. With all our respect for the many good qualities of the reigning monarch, and, in some instances, for his wise conduct, we see no reason for being assured as to the future; or, that, following the fate of most despotisms and rapidly acquired dominions, where no solid ground-work is laid, his system may not soon crumble to pieces under his successors.

We do not, and we cannot, for our lives believe that the Prussian Commercial League, which bears a blind selfishness in its frontispiece, is merely meant to convince England of the iniquity of her Corn-laws, and (we can scarcely repeat the rest without laughing) to *force* her, and other *exclusive* countries, into a greater freedom of trade. Our disbelief on this head, which remains open to conviction, is founded on the tone and arguments of her own writers, and on our intercourse with Prussians (some in private and some in public capacities) in different parts of the continent. "The cloth of my coat is not so good as yours, nor is the leather of my boots—neither are my pen-knives and razors so good as English ones, but, *laissez aller*, in due time, and with proper protecting duties, we shall have all these and every thing else in perfection, and then we shall cease to be *tributaries* to the English." These, or words to this effect, we have not heard merely once, but a hundred times; and the Prussian *gentlemen* we have met, seemed pretty generally to be of opinion, that though it was very proper to export their corn and timber, it was equally so *to grow* their razors and pen-knives at home. They seem to have been convinced of the propriety of the advice which Count Pecchio, with dramatic accuracy, put into the mouth of the late Emperor of Austria, when addressing his subjects, *i. e.* "Always to sell *to* foreigners, but never buy *from*

them." And, indeed, has not Prussia, for many years, been cherishing at her heart's core this artificial forcing process?—with what success, Mr. Jacob, a competent judge, informs us, in his travels in Germany. "As scarcely any competition exists but with their own countrymen, there is little inducement to adopt the inventions of other nations, or to exercise their own faculties in perfecting their fabrics, *none of which have kept pace with those of other countries.* In point of extent, the woollen manufactory, carried on at the *royal storehouse* by Messrs. Woolf, is the most considerable, and good machinery is used; but, in spite of the excellence of the blue dye, and of the fine wool which they have substituted for the Spanish, their products are so inferior to those of Flanders and of England, *that nothing but the kind of monopoly which they and their neighbours enjoy, can enable them to dispose of their goods to a profit.* The quantity of silk goods manufactured in Berlin is very considerable; they are, however, inferior both in design and quality to those of Lyons. Cottons, hats, gloves, hosiery, shoes, and boots, are all inferior to ours; cutlery, ironmongery, and glass-ware, are the same: and many of the minuter articles, such as needles, pins, and a thousand others, which every hour present themselves, are awkwardly and clumsily made."

To force the consumption of all these things, to the exclusion of better and cheaper articles, all over the states included in the Prussian League, will be utterly impossible, and will require, in the fruitless attempt to do so, a most numerous army of *douaniers*, who are, perhaps, the most permanently odious of all armies. Every Prussian working-manufacturer will want at least one custom-house officer to look after his doings, and a state of things will arise, which, without meaning any disrespect, we may, in some measure, compare to what we have seen in certain continental countries, where nearly every galley-slave, who unwillingly did half the work of a free man, was attended by a sturdy soldier, so that the time of two men went to produce half a man's labour. But, as it has been well observed, a million of custom-house officers, even supposing in them a superhuman degree of vigilance and indifference to bribery, could not guard this vast frontier, by sea, by rivers, and by land, from the incursions of the smuggler, who, at the worst, commits only a crime growing out of a government mistake. The greatest smugglers, or connivers at smuggling, under the continental system, were Buonaparte's own troops; and the men who made most money by it were some of his own Generals and Prefets.

That former Continental System ought to be a great example to warn Prussia of the error of her ways—it is an historical and recent fact, which removes all apprehension from us, let her do or attempt what she may.

CHANGES OF ADMINISTRATION AND HISTORY OF PARTIES.

[Continued from last Number.]

The energy of Mr. Pitt's war-administration almost immediately changed the aspect of the contest with France. He seemed to put a new life into the country, and to communicate his own vigour and activity to her fleets and armies in all quarters of the globe. From the moment he assumed the direction of affairs, the enemy was allowed no rest. One aggressive expedition constantly succeeded another; and although at first some of these efforts failed wholly or partially, owing to the bad management of the persons to whom they were entrusted, and whom the Premier could not at once inspire with all his own decision, rapidity, and fertility of resources, yet the grand result was a rich harvest of gain and glory to the arms of England, both by sea and land. On the continent of Europe, the King of Prussia, the Great Frederick, with whom an alliance had recently been formed, strengthened and encouraged by the aid voted to him by the English parliament, and the hearty support his cause received from the new minister, suddenly drove back the tide of Austrian success; and by the two splendid victories of Rossbach and Lissa, gained within a single month, utterly dispersed a combination of enemies by which he had been previously all but overwhelmed. Soon after Prince Frederick of Brunswick, acting at the head of a Hanoverian army in the pay of Great Britain, succeeded in expelling the French from Germany. In 1759, the fall of Quebec and the conquest of Canada formed a still prouder triumph directly achieved by the national arms. About the same time various other important captures were made on the coast of Africa and in the West Indies. Finally, the French power was almost annihilated in Hindostan, where it had till now more than disputed the ascendancy with that of England.

These continued successes sustained and augmented the popularity which had attended the ministers when they entered office. In the meantime, the few changes that took place among the members of the government were merely personal, and did not affect the principle of its construction. In the course of the year 1758, Lord Edgecumbe having been appointed to the office of one of the Chief Justices in Eyre, was succeeded as Chancellor of the Duchy of Lancaster by Lord Dupplin. In the following year, Lord George Sackville, having incurred great blame for his conduct at the battle of Minden, (fought on the 1st of August,) was removed from his office of Lieutenant-General of the Ordnance, and the Marquis of Granby nominated his successor. This year also, the afterwards celebrated Lord North first obtained a place in the government, by being appointed one of the Lords of the Treasury.

George II. died on the 25th of October, 1760. The only changes made upon this occasion were in certain of the offices in the Household. The Earl of Bute became Groom of the Stole in the room of the Earl of Rochfort; Lord Gower succeeded Sir Thomas Robinson as Keeper of the Wardrobe; and was himself succeeded as Master of the Horse by the Earl of Huntingdon. Lord Bute was also made a Privy Councillor.

A few months, however, showed that the ambition of the favourite was not to be thus satisfied. On the 21st of March, 1761, parliament was dissolved—and the next day Mr. Legge, a most efficient member of the administration, was dismissed from his office of Chancellor of the Exchequer. Mr. Legge had given offence to Lord Bute by having two years before refused to support a nominee of his lordship and the Prince as candidate for the representation of Hampshire. He was succeeded by Viscount Barrington, and the latter, as Secretary at War, by the Honourable Charles Townshend, whose place in the household (that of Treasurer of the Chamber) was given to Sir Francis Dashwood. On the 25th the Earl of Holdernesse resigned, and Lord Bute was appointed one of the Secretaries of State in his room. He was succeeded as Groom of the Stole by the Earl of Huntingdon, the Duke of Rutland becoming Master of the Horse, and Earl Talbot obtaining his Grace's office of Lord Steward. About the same time also Lord Sandys was made First Lord of Trade in room of the Earl of Halifax; and his place of one of the Chief Justices in Eyre was given to the Duke of Leeds. His Grace was succeeded as Cofferer of the Household by the Honourable James Grenville.

Considerable surprise was occasioned by Mr. Pitt consenting to remain in office after these changes, and especially notwithstanding the dismissal of his friend and steady supporter Mr. Legge. As the conduct of the war, however, was still left in his hands, he probably thought that he ought not to consider his position as materially affected by changes in departments of the government which he considered of far inferior importance, and with which he had never much interfered. If such was his calculation, he soon found himself deceived. Having received intelligence, upon which he was convinced he could depend, that Spain, which had hitherto stood neutral in the struggle on one side or other of which almost every other power in Europe was arrayed, had pledged herself to take an active part with the enemy, and was only waiting till she had all her force in readiness, on the 18th of September he proposed in council that war should be immediately declared against that country. The reception that his proposition met with proved that he was no longer Prime Minister. It was directly opposed by Lord Bute, and supported by nobody except Lord Temple. A few days after, a second meeting of the Cabinet was held, at which all the ministers were present. No resolution was come to at this meeting; but at a third, every member, except Mr. Pitt and Lord Temple, declared against a war with Spain. The two latter, having ascertained that the King agreed with the majority of the Cabinet, resigned their places on the 5th of October. It was upon this occasion that a pension of 3000*l.* a year was settled upon Mr. Pitt for three lives, and that the title of Baroness of Chatham was conferred upon his wife.

Thus was broken up, after it had lasted about four years and three months, an administration, the history of whose management of the national affairs is a continued series of h e most splendid successes, and whose popularity had gone on increasing up to the moment of its dissolution. It afterwards appeared that the celebrated Family Compact, as it was called, between Louis XV. and Charles III., had actually been signed on the 15th of the preceding August; and within three months from the time Mr. Pitt retired from the government, because his colleagues would not join with him in declaring war against Spain, hostilities with that power had commenced. But by this time the last of the richly laden ships from South America, which it had been his purpose to intercept, had arrived safe in port, and the enemy was in a much better state of preparation than when he had wished to strike the first blow.

Mr. Pitt was succeeded as Secretary of State by the Earl of Egremont, and Lord Temple as Lord Privy Seal by the Duke of Bedford. The only other immediate change which took place was the substitution of the Earl of Thomond as Cofferer in the room of the Honourable James Grenville, who threw up that lucrative office in the Household on the retirement of his two relations. Now, however, that Pitt had been got rid of, Bute remained the undisputed head of the government.

A few months afterwards a dispute with the Duke of Newcastle enabled the royal favourite to step into the office which had been hitherto usually held by the Prime Minister. The Duke, acting upon the politics of the late reign, to which he had been so long accustomed, pressed the more liberal subsidizing of Prussia, and a more vigorous prosecution of the German war; but being opposed by Bute, he was left in a minority. Upon this he gave in his resignation—and on the 29th of May, 1762. Lord Bute was appointed First Lord of the Treasury. He was succeeded as Secretary of State by the Honourable George Grenville, who had remained in office when his brother Lord Temple and Mr. Pitt resigned, and had from that time separated himself from the politics of the rest of his family. Viscount Barrington was removed to the Treasurership of the Navy, which had been held by Mr. Grenville, and his lordship was succeeded as Chancellor of the Exchequer by Sir Francis Dashwood, whose place of Treasurer of the Chamber was given to Sir Gilbert Elliott, a Scottish gentleman, who had been previously first a Lord of the Admiralty, and then of the Treasury.

Although this new appointment can hardly be considered to have made Lord Bute more completely the head and chief moving power of the government than he was before, it appears to have roused against him a storm of popular indignation and parliamentary opposition, much more violent than he had hitherto experienced. Up to this time, indeed, the House of Commons had given him scarcely any trouble; for Pitt and his friends, although they had left office, continued to give their support in general to the measures of the government. The first number of Wilkes's famous paper, 'The North Briton,' was published on the 5th of June, that day week after Bute's nomination as First Lord of the Treasury. The first number of 'The Briton,' to which the 'North Briton' was an answer, had appeared on the very day of that nomination. In his second number, Wilkes, speaking in the character he had assumed, says sarcastically, "I cannot conceal the joy I feel as a North Briton, and I heartily congratulate my dear countrymen on our having at length accomplished the great, long-sought, and universally national object of all our wishes, the planting a *Scotsman* at the head of the *English* Treasury. I was indeed before very well pleased with the conduct of the two other gentlemen at that Board, who are likewise natives of our country (he means Elliott and James Oswald, Esq.); but then they were obliged to serve under a noble Duke of a peculiar cast, whose views were most evidently neither to enrich himself, nor to aggrandize us. My joy and exultation are now complete, for I have lived to see my countryman, the Earl of Bute, adorned with the most noble Order of the *Garter*, (which hath been given to *us* with so sparing a hand, and only for the most brilliant national services,) and presiding over the finances of this kingdom. This is the post which the Prime Minister hath generally kept for himself, and is of the first importance in this country. It must ever be so in times of war, and above all in this wide extended but glorious war, when nearly the sum of twenty millions will be this year raised on the subject;—though, I thank heaven, but a *fortieth* part of it will be paid by us."

In September following, negotiations for peace were opened with France. Lord Bute upon this occasion appeared to be so eager to bring the war to a close upon almost any terms, that it has been even suspected he was bribed by the enemy. Indeed, two or three years afterwards, a Dr. Musgrave published a circumstantial statement about certain large sums of money, which, according to the information he had obtained, had been transmitted from the French Treasury to his Lordship and several of his friends. Be this, however, as it may, Bute showed himself in the course of the negotiation so ready to grant whatever the opposite party demanded, and to throw away the most important advantages which her late successes had obtained for England, that even Mr. Grenville at length declined to go along with him in so profuse and unnecessary a sacrifice of the national rights and interests. While the negotiation was still pending, intelligence arrived of the capture of the Havannah. Bute immediately proposed that it should be restored to Spain without an equivalent; while Grenville insisted that Florida and Port Rico should be demanded in lieu of it. Urged as he was at the same time by the representations of the Duke of Bedford, to whom the management of the negotiation had been intrusted, the Premier felt it necessary to go so far as to ask for Florida; but he positively enjoined the Duke to make no mention of Porto Rico. Florida accordingly was all that was eventually obtained. Meanwhile Mr. Grenville thought it necessary to withdraw from the Cabinet, though not from office, and on the 12th of October he exchanged places with Lord Halifax, the First Lord of the Admiralty. Halifax was considered a subservient adherent of the Premier. Very soon after this, the Duke of Devonshire resigned his office of Lord Chamberlain, and went into opposition. His place was supplied by the Duke of Marlborough.

The General Peace (called the Peace of Paris) was not concluded till the 10th of February 1763, but the preliminaries of that between France and England were signed at Fontainebleau on the 3rd of November, 1762. The English Parliament met on the 25th of the same month; and the articles were immediately laid before the two Houses for approval. Mr. Fox, who continued to hold the office of Paymaster-General, to which he had been appointed on the formation of Mr. Pitt's Administration, now appeared as the ministerial leader in the House of Commons. As such he found himself once more engaged in fierce combat with his old rival. Pitt opposed the motion for the approval of the articles of peace with extraordinary vehemence, denouncing the proposed treaty as in the highest degree both dishonourable and insecure. But whatever might be the strength of the minority in eloquence and argument, the division proved their extreme numerical weakness. The motion for approving of the Treaty was carried by a majority of 319 to 65. In fact, the nation, as usually happens after some years' experience of the burthens and inconvenences of war, had become generally anxious for peace. Besides, although England by the present treaty, perhaps relinquished a good deal which she might neither unfairly nor without good hope of success have insisted upon retaining, the treaty considered by itself was by no means a disadvantageous one. Of what we had possessed before the commencement of the war, we gave up nothing, and we obtained a large accession of new territory. The surrender of Canada by France, and that of Florida by Spain, extended our American empire, formerly occupying only the middle section of that range of country, over the whole continent from the Polar Sea to the Gulph of Mexico, or almost from the Arctic circle to the Tropic of Cancer. These acquisitions were probably in those days considered more than a compensation for the restoration of the French settlements in the East Indies. It is to be added, as helping to account for the little success that attended the efforts of the opposition to excite a feeling against the ministry on account of the peace, that Mr. Pitt was by no means at this time the popular favourite he once had been, not having yet recovered the ground he had lost by his late acceptance of a pension.

The popularity of the Premier, however, was infinitely less. Lord Bute certainly at no time had any party in the country, and disclosures which have been since made would go to show, that he stood almost equally without support in the Cabinet of which he appeared to be the head. He possessed the favour of the King, and that seems to have been

nearly the whole strength with which he attempted to wield the government. Every thing connected with him contributed to make him an object of dislike to the bulk of the nation—his birth,—his pompous, haughty and repulsive deportment,—his arbitrary politics,—the undeserved share he enjoyed of the King's confidence,—the rewards and honours which he had in this way secured to himself,—the absurd vanity and insolence of his attempt, without either commanding talents or natural power, or influence of any other kind, to found, as it were, and build up a new system of government, in defiance alike of the whole peerage and the whole people, and with the aid of the prerogative alone. The feelings which were thus engendered waited only for an occasion on which to break out into a flame. This was afforded by a bill which was, in the course of the session, brought into Parliament for imposing a tax upon cider, and subjecting the manufacture of that article to all the laws of the Excise. Against this measure the Opposition in Parliament took their ground in the most determined spirit. That body had about this time become consolidated and strengthened by the union of its several sections; the leaders of which, in order to show the public their force, and the cordiality and concert with which they were disposed to act, agreed to dine together once a week at each other's houses. The first of these dinners was given by Lord Temple at his house in Pall Mall, about the end of February, 1763; the second by the Duke of Newcastle in the beginning of March. Besides these two noblemen, the principal persons who were thus associated were, the Dukes of Bolton, Devonshire, Grafton, and Portland, the Marquis of Rockingham, the Earls of Almarle, Ashburnham, Besborough, Cornwallis, Hardwicke, Scarborough, and Spencer; Lords Abergavenny, Dacre, Fortescue, Grantham, Sondes, Walpole, and Villiers; Mr. Pitt, Sir George Saville, Mr. Charles Townshend, &c.

Notwithstanding the opposition which it encountered at every step, the Cider Bill was carried through both Houses. Except upon this single question, also, the ministerial majorities had yet suffered but little, if any diminution. But while things were in this state, on the 8th of April Lord Bute suddenly resigned. The true reasons which induced him to take this unexpected step are most probably those assigned by himself in a letter to a friend, which has been published by Mr. Adolphus in his 'History of the Reign of George III.' "Single," he says in that letter, "in a Cabinet of my own forming—no aid in the House of Lords to support me except two peers, (Lords Denbigh and Pomfret,) both the Secretaries of State silent, and the Lord Chief Justice, whom I brought myself into office, voting for me, yet speaking against me—the ground I tread upon is so hollow, that I am afraid not only of falling myself, but of involving my royal master in my ruin: it is time for me to retire."

When the favourite retired from office, however, he probably did not retire from power, but continued, while lurking behind the throne, to be nearly as much Prime Minister as he had been while standing before it. His resignation at all events brought with it but little immediate change either of measures or of men. His place of First Lord of the Treasury was in a few days given to Mr. George Grenville, who was also appointed Chancellor of the Exchequer, and became in the mean time the head of the Administration. Sir Francis Dashwood, whom he displaced from the Chancellorship of the Exchequer, was again provided for in the Household, being made Keeper of the Wardrobe; he was at the same time called up by summons to the House of Lords, as Baron Le Despencer. Mr. Grenville was succeeded as First Lord of the Admiralty by the Earl of Sandwich. Mr. Grenville and the Earls of Egremont and Halifax were generally regarded by the public as the representatives of the Bute interest, and the principal offices in the government remained in their hands. Mr. Fox still continued in the subordinate office of Paymaster. A curious passage with regard to this gentleman occurs in the 44th number of the 'North Briton,' published on the 2nd of April, immediately previous to Lord Bute's retirement. The writer, after having prognosticated as usual that a change must come ere long, concludes as follows: "As it may be convenient to many persons, on various accounts, to give as near a guess as possible when this ministerial revolution will take place, I shall give them a hint, which may perhaps assist their conjectures, and propose Mr. Fox as a mark of observation to all who trade in politics. His steadiness to his own interest, with his remarkable talents of penetration, have hitherto enabled, and I doubt not will still induce him to quit his post when he can keep it no longer, and to leave his friends in the lurch. When we see him therefore *flying from the storm*, pleading age and sickness, *accepting of a peerage*, or retiring to the government of the Alley; we may safely conclude that a change is at hand, and that concord shall once more take place among us." This, as we have said, was published on the 2nd of April; Lord Bute resigned on the 8th; and on the 16th Mr. Fox was made a peer, by the title of Lord Holland. He also soon afterwards retired to France.

The administration of Mr. Grenville commenced with a proceeding which would alone have rendered it sufficiently memorable—the famous contest with Wilkes. Parliament was dissolved on the 19th of April, on which occasion his Majesty, according to the ordinary form, addressed both Houses in a Speech from the Throne. This Speech was taken by Wilkes for the subject of his 45th 'North Briton,' published on the following Saturday, the 23rd, and, under the plea that it was to be considered as the Speech of the Minister, was somewhat severely handled, although there was scarcely any thing in the paper that would be thought worth noticing in the present day. On the 30th, however, a warrant was issued, bearing the signature of Lord Halifax as Principal Secretary of State, and dated the 26th, for the apprehension of the authors, printers, and publishers of the number, which was described as "a seditious and treasonable paper." The messengers to whom this order was directed, although they had nothing to guide them as to the particular individuals they were required to take into custody, repaired to the house of Mr. Wilkes, and summoned him to follow them. This he refused to do. The messengers however returned, and brought him by force before Lord Halifax and Lord Egremont. The same day he was, by the authority of the two Secretaries, committed to the Tower, as "being the author and publisher of a most infamous and seditious libel, tending to inflame the minds, and alienate the affections of the people from his Majesty, and to excite them to *traitorous* insurrection against the government." It will be observed that the description of the libel as *treasonable*, is dropped in this second warrant. Mr. Wilkes was now kept in close custody: all his friends, including his legal advisers, were refused admittance to him, his house was forcibly entered and searched, and all his papers carried away.

A Habeas Corpus, however, having been applied for, he was on the 3rd of May brought up on that writ to the bar of the Court of Common Pleas, before Chief Justice Pratt, (afterwards Lord Camden.) After a very long debate the case was adjourned till the 6th, and the prisoner was in the meanwhile remanded to the Tower. On the 6th the Court delivered its judgment, that the privilege of parliament extended to the present case; and Mr. Wilkes (who, it is to be remembered, was member for Aylesbury) was ordered to be discharged. No decision was pronounced upon this occasion in regard to the point afterwards agitated, the illegality of what are called general warrants, that is, warrants in which no person is specified by name.

A few days after his liberation, Mr. Wilkes was served with a subpœna to answer an information for the seditious libel exhibited against him in the Court of King's Bench. But considering this to be another violation of the privileges of parliament, he declined entering an appearance, or taking any notice of the summons. In this state the matter remained till the re-assembling of Parliament on the 15th of November.

In the meanwhile, however, some further ministerial changes had occurred. The sudden death of the Earl of Egremont on the 20th of August, had for a short time thrown his colleagues into the greatest perplexity. Charles Wyndham, Earl of Egremont, the son of Sir William Wyndham, the celebrated Tory leader of the former reign, was certainly one of the ablest members of the present administration. On this occasion Lord Bute made an attempt to induce Mr. Pitt again to take office, which was very nearly successful. The two, on the proposal of his Lordship, met at the house of Mr. Pitt in Jermyn Street, on Thursday the 25th of August. At this interview Mr. Pitt explained his views at considerable length and with perfect frankness; and the result was, that on the following day he received an open note, requiring him to attend his Majesty on Saturday the 27th, at Buckingham House. He accordingly went thither at noon, proceeding through the Mall in

his gouty chair, the peculiar form of which made it well known. He had an audience of the King in the closet, which lasted for three hours, and in the course of which his Majesty is said to have admitted in substance, that he thought his present Ministers could not go on. On taking his departure he was desired to come again on Monday. On Sunday Mr. Pitt communicated every thing that had taken place to the Duke of Newcastle; at this time believing that every thing would be settled according to the arrangements which he had proposed. He also wrote to the Duke of Devonshire and the Marquis of Rockingham, and the Duke of Newcastle wrote to his old colleague Lord Hardwicke, whom it was now intended to put into the place of President of the Council.

On Monday Mr. Pitt returned to the palace in the same public manner as before. He was again received very graciously, and was with his Majesty two hours. "The King," says Lord Hardwicke in a letter to his son, from which these details are taken, "began, that he had considered of what had been said, and talked still more strongly of his honour. His Majesty then mentioned Lord Northumberland for the Treasury, still proceeding upon the supposition of a change. To this Mr. Pitt hesitated an objection—that certainly Lord Northumberland might be considered, but that he should not have thought of him for the Treasury. Mr. Pitt said, 'Suppose your Majesty should think fit to give his Lordship the Paymaster's place?' The King replied, 'But, Mr. Pitt, I had designed that office for poor George Grenville. He is your near relation, and you once loved him.' To this the only answer made was a low bow. And now here comes the bait. 'Why,' says his Majesty, 'should not Lord Temple have the Treasury? You could go on then very well!' 'Sir, the person whom you shall think fit to honour with the chief conduct of your affairs, cannot possibly go on without a Treasury connected with him; but that alone will do nothing. It cannot be carried on without the great families who have supported the Revolution government, and other great persons, of whose abilities and integrity the public have had experience, and who have weight and credit in the nation. I should only deceive your Majesty if I should leave you in an opinion that I could go on, and your Majesty make a solid administration on any other foot.' 'Well, Mr. Pitt, I see (or I fear,) this won't do. My honour is concerned, and I must support it.'"

And thus the negotiation ended. Mr. Pitt professed to be firmly persuaded, that both Lord Bute and the King were in earnest at first: but he was convinced, that on the Sunday some strong influence had been used, which produced a determination to break off. It is pretty evident that Mr. Pitt had intended to keep the place of First Lord of the Treasury for himself. Lord Hardwicke adds: "Ministers are so stung with this admission that they cannot go on, (and what has passed on this occasion will certainly make them less able to go on,) and with my Lord Bute's having thus carried them to market in his pocket, that they say Lord Bute has attempted to sacrifice them to his own fears and timidity,—that they do not depend upon him, and will have nothing more to do with him. And I have been very credibly informed, that both Lord Halifax and George Grenville have declared, that he is to go beyond the sea, and reside for a twelvemonth or more."

The government was at last completed on the 9th of September, by the appointment of Lord Sandwich to the place of Secretary of State, the Earl of Egremont succeeding his Lordship as First Lord of the Admiralty. On the same day the place of Lord President of the Council, which had been vacant for some time by the death of Lord Granville, was given to the Duke of Bedford. This office, previous to the negotiation with Mr. Pitt, had been offered by the King through Lord Egremont to the Earl of Hardwicke, but declined. Lord Egremont and Mr. Grenville are said to have then wished that the Duke of Leeds might have it (his Grace held the appointment of one of the Chief Justices in Eyre); but Lord Bute insisted that it should be bestowed upon the Duke of Bedford. This nobleman possessed great influence, not only from his rank and extensive possessions, but also from his talents and character; and after his accession the ministry came to be generally distinguished as the Duke of Bedford's ministry.

When Parliament re-assembled in November, the first business brought before the House of Commons was the case of Mr. Wilkes. The subject was introduced on the first day of the session, by a message from the King, which was delivered by the Chancellor of the Exchequer. A motion that No. 45 of the 'North Briton,' was a false, scandalous, and seditious libel, and that it should be burnt by the hands of the common hangman, was carried by a majority of 273 to 111. On this occasion Mr. Pitt spoke and voted with the majority. When, however, it was proposed on the 23rd, to declare that the privilege of Parliament did not extend to the case of writing and publishing seditious libels, he took his place among the opponents of the ministry. But this resolution also was carried, though not by so large a majority, the numbers being 258 to 133. On the 20th of January, 1764, Mr. Wilkes was by another vote expelled from the House of Commons, and a new writ was issued for Aylesbury. Having gone abroad during these proceedings, he was soon afterwards outlawed for not appearing to various indictments, which were preferred against him on account of his infamous poem, entitled an 'Essay on Woman.'

On the 14th of February, the question of the illegality of general warrants was brought forward in the House of Commons by Sir W. Meredith, who moved, "That a general warrant for apprehending and seizing the authors, printers, and publishers of a seditious libel, together with their papers, is not warranted by law." On this occasion, the House sat till half past seven o'clock on the morning of the 15th, when an adjournment of the debate till the 17th was carried by a majority of 208 against 184. This sitting, which lasted for seventeen hours, was then the longest that had ever been known in the House of Commons; and it is probably still without a rival. Horace Walpole, who, in his "Letters to Lord Hertford," has given a highly interesting account of these discussions, and the only one that has been preserved, says, "Do you know, not only my Lord Temple—who, you may swear, never budged as spectator—but old Will. Chetwynd, now past eighty, and who had walked to the House, did not stir a single moment out of his place, from three in the afternoon till the division at seven in the morning. Nay, we had *patriotesses*, too, who staid out the whole. Lady Rockingham and Lady Sondes, the first day*: both again the second day, with Miss Mary Pelham, Mrs. Fitzroy, and the Duchess of Richmond, as patriotic as any of us. Lady Mary Coke, Mrs. George Pitt, and Lady Pembroke, came after the opera, but, I think, did not stay above seven or eight hours at most." Ministers had met Sir W. Meredith's motion by an amendment, that the following words should be added, "Although such warrant has been issued according to the usage of office, and has been frequently produced to, and never condemned by, courts of justice." From the state of the votes on the question of adjournment, the Opposition were high in hope that they should, on the 17th, beat the Ministry on the general question. Concluding his history of the "great week" to his correspondent, on the following Sunday evening, Walpole continues: "By the time you have read the preceding pages, you may perhaps expect to find a change of the Ministry in what I am going to say. You must have a little patience: our Parliamentary war, like the last war in Germany, produces very considerable battles, that are not decisive. Marshal Pitt has given another great blow to the subsidiary army, but they remained masters of the field, and both sides sang *Te Deum*. I am not talking figuratively, when I assure you, that bells, bonfires, and an allumination from the Monument, were prepared in the city, in case we had had the majority. Lord Temple was so indiscreet and indecent as to have faggots ready for two bonfires, but was persuaded to lay aside the design even before it was abortive." The debate, according to Walpole, was a very dull one. "I never," he says, "knew a day of expectation answer. The unpromptus and the unexpected are ever the most shining. We love to hear ourselves talk, and yet we must be formed of adamant to be able to talk, day and night, on the same question, for a week together. If you had seen how ill we looked, you would not have wondered we did not speak well. A company of colliers, emerging from damps and darkness, could not have appeared more ghastly and dirty than we did on Wednesday morning; and we had not recovered much bloom on Friday." In the course of this debate, the Solicitor-General, Sir Fletcher Norton (after-

* The House had also sat on Monday, the 13th, examining evidence, in regard to the apprehension of Mr. Wilkes, for eleven hours.

wards Speaker) told the House, that they might pass the resolution if they pleased, but that, were he one of the twelve judges, he would mind it no more than if it had been a resolution passed by a crew of drunken porters! "Had old Onslow been in the chair," exclaims Walpole, "I believe he would have knocked him down with the mace." At five in the morning they divided. It appears, from a short statement by Mr. Charles Townshend, that the question upon which the division took place, was a motion made to adjourn the debate for four months. The Noes were so loud—the sound of that monosyllable, Walpole remarks, is deeper than that of Aye—that the Speaker, Sir John Cust, decided that the Ayes (those in favour of the adjournment) should go into the lobby, according to the rule, that those who are supposed to be the majority should remain in the House. "They went forth," continues the letter; "and when I heard our side counted to the amount of 218, I did conclude we were victorious; but they returned 232. It is true we were beaten by 14, but we were increased by 21; and no Ministry could stand on so slight an advantage, if we could continue above 200. We may, and probably shall fall off; this was our strongest question—but our troops will stand fast; their hopes and views depend upon it, and their spirits are raised. But for the other side, it will not be the same. The lookers-out will be stayers away, and their very subsidies will undo them. . . . You would have almost laughed to see the spectres produced by both sides; one would have thought that they had sent a search-warrant for members of Parliament into every hospital. Votes were brought down in flannels and blankets, till the floor of the House looked like the pool of Bethesda. It is wonderful that half of us are not dead. . . . . I felt from nothing so much as the noise, which made me as drunk as an owl; you may imagine the clamour of two parties, so nearly matched, and so impatient to come to a decision." The ladies, it is added, came down again, but in such squadrons, that the House was obliged to refuse them admittance. Eight or nine of them, however, remained in one of the Speaker's rooms till twelve at night, playing at loo.

Walpole's expectations of an immediate break up of the Ministry, and triumph of the uncemented collection of parties forming the Opposition, with which he acted, turned out quite visionary. As soon as Wilkes's affair had been settled in the way that has just been mentioned, the formidable minority began to fall to pieces. Pitt, Charles Townshend, and many others, even absented themselves altogether from the House. "The probability of success," says the author of the 'History of the late Minority,' "being now farther removed than ever, they began to break with one another, and every man became jealous of his friend's being reconciled to the Minister, or some way or other making his peace at St. James's before himself. In a few weeks desertion and dissatisfaction prevailed throughout the whole party; insomuch, that when the public business came on, that is, the plan of Supplies, which every Opposition has thought itself bound to oppose, they were almost totally silent; which gave to the Ministers such a manifest appearance of superiority, that it had a wonderful effect upon what are called the *flying squadron*—a considerable part of whom had joined the minority, upon the late probability of success from that quarter: they were now so thoroughly convinced of their error, that they returned to the court with views of the most faithful attachment. The Session, therefore, ended without any further efforts of the minority." On the 27th of March we find Walpole writing as follows: "I have not been at the House this month; the great points which interested me are over, and the very stand has shut the door. I might like some folks *out*, but there are so few that I desire to see *in*, that indifference is my present most predominating principle."

It was during the tranquil latter part of this Session, that Mr. Grenville brought forward, among his financial schemes for the coming year, those several disastrous measures of colonial policy, which, after involving the country in a long and expensive war, eventually occasioned the loss of America to the British crown—the regulations restricting the trade of the English with the Spanish settlements, the act imposing duties upon various articles of American merchandise, and the celebrated resolution, "That towards defraying the expenses of protecting and securing the colonies, it may be proper to charge certain Stamp duties in the colonies." The only member of the House of Commons who opposed even the last-mentioned of these propositions—that which was felt by the colonists as the most decidedly unjustifiable interference with their rights, and the announcement of which, accordingly, chiefly set the country in a flame—was the Honourable Henry Seymour (afterwards General and Field-Marshal) Conway, the brother of Lord Hertford. Even at this the commencement of a course of proceedings which terminated so fatally, Mr. Conway protested against the right assumed by the British Parliament, of imposing taxes on the people of America. The bill for imposing duties on American merchandise received the royal assent on the 5th of April, 1764, and Parliament rose on the 19th of the same month. On the same day, Ministers ventured upon an act, which was considered at the time one of a very violent character—the dismissal of General Conway, both from his place of Groom of the Bedchamber, and from his regiment, avowedly on the ground of his vote, at the commencement of the Session, against the legality of General Warrants.

The next Session opened on the 10th of January, 1765. "Your brother," says Horace Walpole, writing on that evening to Lord Hertford, "is likely to make a very great figure; they have given him the warmth he wanted, and may thank themselves for it. Had Mr. Grenville taken my advice, he had avoided an opponent that he will find a tough one, and must already repent having drawn upon him." On Tuesday the 29th, the question of General Warrants was again brought forward by Sir W. Meredith, who moved a resolution, declaring their illegality, in nearly the same terms with that of the preceding Session. The debate was again a very protracted one, lasting till six on the following morning; when, upon a division, the numbers were found to be, 185 for the resolution, and 224 against it. Ministers met the motion in the same way they had done on the former occasion—namely, by moving an addition to the original resolution, which went to make it ridiculous. This was a practice not unusually resorted to in those days, but which would now be scarcely tolerated or attempted. One of its effects was, from the form in which the question was entered in the Votes, to make it appear that the contradiction and absurdity had proceeded from the mover of the original resolution, and been supported by him and his friends. In the present debate, great indignation was expressed on the part of the minority, at the employment of this discreditable manœuvre. We have before us a very interesting collection of original letters from General Conway to his brother, one of which, dated "31st January, 1765," gives a long account of this discussion, in which the writer himself took a prominent part. The conduct adopted by the Ministers seemed "to the friends of the original motion," says General Conway, "such an unparliamentary and indecent way of proceeding, and to myself in particular, that I spoke with some warmth on the subject, and said I thought it was trifling on a grave question—was childish and a mockery of Parliament—and, I doubt not, in warmth I said I thought *a shameful way of treating* this great national question. You may imagine such words were not let pass. I was called to order, but, after some altercation we maintained our ground; for Onslow called upon the Speaker to decide whether the words used were *orderly*, and he, with more steadiness than *we* expected, declared they were, and that, if I thought the manner of proceeding was such, I had a right to say so; and so that matter ended. . . . . It was not, on the whole, a good debate, which is commonly the case in a matter so worn out." After short notices of the principal speeches, and of the composition of the majority and minority, he adds, "An incident happened to-day, which throws some light, I think, on the method taken of altering the question, in order to condemn it; for Sir W. Meredith complaining that it would stand on the Votes entire, as amended, and, therefore, given as his motion in that strange shape, it was unanimously agreed in the House, that the Votes should state it at large; first, as it was moved; then, the amendment; and lastly, as it stood amended: and I was very glad of the opportunity of closing and approving this candid proceeding, as I had been condemned for too much warmth yesterday, and only took occasion from thence to hope that what now passed, and the difficulty yesterday's proceeding had brought us into, would be a reason for keeping to the usual Parliamentary modes of dismissing questions we did not like, instead of torturing them into shapes quite different from the intention of the movers, in order, afterwards, to reject them." He after-

wards says, "There was an absolute determination to make some motion on the subject of our dismissions; but there is so much fear and caution, and, indeed, I think, very poor timidity in so many quarters, that a vast number of those who think the thing wrong, are afraid to take any manly part in declaring so, for fear of future consequences; which goes so far, that I now question if the thing will be moved at all. Personally, I am much better pleased than if it was; politically, I think it shameful to give up the army into the hands of every arbitrary Minister; both as an indignity to our profession, and as an additional branch of that general corruption, which, I think, bids fair to ruin this country. I am not without a little personal mortification, in seeing how easily our private cause has been given up; but I feel much more in the tameness of seeing so coolly such a blow given to Parliamentary independency."

Then comes the following paragraph: "A strong notion prevails in the world—I fancy not without a good deal of foundation—that there is a great division among the Ministers, or, rather, between the Ministers and Lord Bute; but to what extent it has, or will go, I shall not pretend to foresee; nor can I say I feel any ways interested in the event. I am, I believe, the most injured by one party, but not partial to the other; and, for the misfortune of this country, I see no immediate prospect of forming any system of administration, that I think an object of any earnest expectation, from the tempers of men and the strange constitution of the times."

In point of fact, the Ministers, ever since their rupture with Lord Bute, the preceding year, had been losing ground at court, and they were now merely tolerated by their royal master. Some months before this, honours and appointments of various kinds had begun to be given away by the King, without asking either the consent or the advice of his responsible counsellors. In this way, in the preceding May, Dr. Terrick had been made Bishop of London, and Dr. Lambe of Peterborough; and the Lord Chancellor Henley had been created Earl of Northington. On the 3rd of August, 1764, we find Horace Walpole writing, "The royal family reside chiefly at Richmond, whither scarce necessary servants attend them, and no mortal else but Lord Bute." Again, under date of the 9th of September, he says, "The court, independent of politics, makes a strange figure. The recluse life led here at Richmond, which is carried to such an excess of privacy and economy, that the queen's friseur waits on them at dinner, and that four pounds only of beef are allowed for their soup, disgusts all sorts of people. The drawing-rooms are abandoned; Lady Buckingham was the only woman there on Sunday se'nnight. . . . In short, one hears of nothing but dissatisfaction, which, in the city, rises almost to treason." Again, on the 3rd of November, "Our politics are all at a stand. The Duke of Devonshire's death, I concluded, would make the Ministry all powerful, all triumphant, and all insolent. It does not appear to have done so. They are, I believe, extremely ill among themselves, and not better in their affairs, foreign or domestic. . . . . The unpopularity of the court is very great indeed—still I shall not be surprised if they maintain their ground a little longer." On the 22nd of January, 1765, he writes, "Lord Bute and George Grenville are so ill together, that decency is scarce observed between their adherents; and the moment the former has an opportunity, or resolution enough, he will remove the latter."

Matters were in this state when, in the beginning of April, the King was suddenly attacked by an alarming illness. Upon his recovery after a few weeks, his Majesty greatly surprised his Ministers at their first audience by laying before them a speech ready prepared, which he told them he intended to deliver to Parliament, proposing, among other things, that there should be vested in him the power of appointing the Queen, or any other person of the Royal Family, to act in case of his demise as Regent, during the minority of his successor. The Ministers, probably not disapproving of the measure recommended, whatever they may have thought of the rest of the proceeding, did not think proper to oppose his Majesty's intention; and he accordingly went down to the House of Lords, and delivered the speech from the throne. A bill in conformity with the royal suggestion was immediately brought into that House, where it underwent several warm discussions. A dispute having arisen as to the meaning of the words "or any other person of the Royal Family," Lord Halifax, the Secretary of State, rose and declared that the Royal Family included only the descendants of George II. He added, that this was the construction put upon the words by the King himself. According to this interpretation, the bill excluded the Princess Dowager of Wales, his Majesty's mother. The circumstance gave deep offence to the King; and means were taken to let this be sufficiently understood by the public. The consequence was, that when the bill came down to the House of Commons, Mr. Morton, a near relation of the Earl of Bute, having moved that the name of the Princess should be expressly inserted, this amendment was carried by the large majority of 167 to 37.—Thus amended, the bill passed into a law.

It was during these transactions that the extraordinary scene took place recorded by Junius in the following passage: "The Ministers having endeavoured to exclude the Dowager out of the Regency Bill, the Earl of Bute determined to dismiss them. Upon this the Duke of Bedford demanded an audience of the King, reproached him in plain terms with duplicity, baseness, falsehood, treachery, and hypocrisy; repeatedly gave him the lie, and left him in strong convulsions." But notwithstanding all the difficulties of their position, the Ministry still seem to have considered that they were in little or no danger. Their strength lay in a single point—but there they believed themselves to be impregnable. They were detested by the Court—despised by the country—not well united among themselves;—their parliamentary force was by no means either of overwhelming numerical superiority, or perfectly to be depended on;—the rising discontents of America—for already the colonists, although no act of violence had yet been committed, had manifested universally the most determined resolution to resist the stamp duties—the symptoms, we say, of the storm that soon blew so furiously from this new quarter might well be supposed to add something to the threatening prospect that presented itself to Mr. Grenville and his associates. But against all this the members of the Government placed the inherent want of affinity among the several parties that sought their overthrow, and the apparent impossibility of constructing another administration out of such heterogeneous and discordant elements. How were the genuine old Whigs—the supporters of the somewhat modified politics of Pitt and his friends—the Pelhams and their connexions and the Tory adherents of the Earl of Bute—to be comprehended in the same Cabinet, or even long kept together in pursuit and defence of the same general course of policy?

The Court, however, determined to make a strong effort to bring about a change. Lord Bute having advised that overtures should be again made to Mr. Pitt, the Duke of Cumberland, the King's uncle, consented to conduct the negotiation; his Royal Highness had always steadily attached himself to the Whig party. The first meeting took place on the 15th of May, between the Duke and Lord Temple. On this occasion, the latter stated that the conditions upon which he and his friends would enter office were the following;—that certain foreign alliances should be formed: that those officers, both civil and military, who had been deprived of their appointments for their votes in Parliament, should be restored; that the excise on cider should be repealed; and that General Warrants and the seizure of papers should be wholly condemned. To all these demands his Royal Highness assented; but he stated that it was the King's desire that Lord Northumberland should be placed at the head of the Treasury—in other words, should be the Prime Minister. The Earl of Northumberland, whose son had married Lord Bute's daughter, was considered one of the most attached friends of the favourite. He held at this time the government of Ireland, in allusion to which appointment Lord Temple replied that he never would come into office under Lord Bute's Lieutenant; and with that the conference broke off.

On the 19th another interview took place between the Duke and Mr. Pitt, at the House of the latter at Hayes. It is said that Mr. Pitt had not in the interim had any communication with Lord Temple; but he was equally decided as that nobleman had been, when his Royal Highness mentioned the King's wish to give the Treasury to Lord Northumberland, in instantly declaring the proposition inadmissible.

On the 20th the Duke sent Lord Frederick Cavendish to Mr. Pitt with new terms. It was now proposed that the appointment of Lord Northumberland to the Treasury should

be given up, provided his Lordship were provided for in some other way. Mr. Pitt, however, insisted upon being left unshackled by any such conditions. He declared, as he had done to his Royal Highness the day before, that he was ready to go to St. James's, if he could carry the Constitution along with him. On receiving this answer, the Duke immediately offered the Treasury to Lord Lyttleton; but that nobleman declined entering into any negociation until he had consulted Mr. Pitt and Lord Temple. On this his Royal Highness advised the King to continue his present servants.

Horace Walpole gives some interesting details respecting the progress and results of these negociations. Writing to Lord Hertford on the 20th, after it became known that the attempt had failed, he says: "Words cannot paint the confusion into which everything is thrown. The four Ministers — I mean the Duke of Bedford, Grenville, and the two Secretaries — acquainted their master yesterday that they adhere to one another, and shall all resign to morrow, and perhaps must be recalled on Wednesday." On the 22nd he writes, — "The King is reduced to the mortification, and it is extreme, of taking his old Ministers again. They are insolent enough, you may believe. Grenville has treated his master in the most impertinent manner, and they are now actually digesting the terms that they mean to impose on their captive, and Lord Bute is the chief object of their rage; though I think Lord Holland will not escape, nor Lord Northumberland." In fact, both these noblemen were immediately afterwards dismissed from their offices, as was also Lord Bute's brother, the Honourable James Stuart Mackenzie, who held the office of Lord Keeper of the Privy Seal for Scotland, and as such acted as a sort of Secretary of State for that country. The Ministers insisted, as the condition of their remaining in office, upon the King giving his consent to these removals. They also demanded that Lord Bute should not interfere directly or indirectly in the affairs of Government; and that the Marquis of Granby should be placed at the head of the army instead of the Duke of Cumberland, whom his Majesty had threatened to put in that place. "You have more than once," says Walpole to Lord Hertford, "seen your old master (George II.) reduced to surrender up his closet to a cabal, but never with such circumstances of insult, indignity, and humiliation!" On Friday the 24th, he writes,—"On Wednesday the Ministers dictated their terms; you will not expect much moderation; and, accordingly, there was not a grain. . . . . You may figure the King's indignation. He expressed his anger and astonishment, and bade them return at ten at night for his answer; but before that he sent the Chancellor to the junto, consenting to displace Mekinsy (Mackenzie), refusing to promise not to consult Lord Bute, though acquiescing to his not interfering in business, but with a peremptory refusal to the article of Lord Granby. The rebels took till next morning to advise on their answer, when they gave up the point of Lord Granby, and contented themselves with the modification on the chapter of Lord Bute."

It was thought by many that on this occasion Mr. Pitt showed more than a necessary degree of intractability. Mr. Burke, in a letter to Mr. Flood, dated the 18th of May, says; "Nothing but an intractable temper in your friend Pitt can prevent a most admirable and lasting system from being put together, but this crisis will show whether pride or patriotism be predominant in his character; for, you may be assured, he has it now in his power to come into the service of his country upon any plan of politics he may choose to dictate, with great and honourable terms to himself, and every friend he has in the world, and with such a strength of power as will be equal to any thing but absolute despotism over king and kingdom. A few days will show whether he will take this part, or continue on his back at Hayes, talking fustian."

His Majesty, however, felt the thraldom to which he had been reduced so galling, that he soon renewed with increased determination his efforts to throw it off. This time he took the management of the negociation into his own hands, and on the 25th of June he sent for Mr. Pitt and Lord Temple to Buckingham House. The conditions he proposed were, that Mr. Stuart Mackenzie should be restored—that Lord Northumberland should be appointed Lord Chamberlain—and that his other friends should be continued in their present places. Mr. Pitt did not stand out against the two first of these stipulations; of the last he required a more specific statement; but Lord Temple declared against the whole, and the negociation of course again broke off. Lord Temple's conduct on this occasion is the more remarkable, from the circumstance, that about a month before, during the progress of the previous negociation, he had become reconciled to his brother, Mr. Grenville. Writing on the 22nd of May, Horace Walpole says; "I have a more extraordinary event to tell you than all I have related. Lord Temple and George Grenville were reconciled yesterday morning, by the intervention of Augustus Hervey; and perhaps the next thing you will hear may be, that Lord Temple is sent by this ministry to Ireland."

The attempt was notwithstanding once more renewed in another quarter. The Duke of Cumberland, having now obtained his Majesty's consent, to select as the successors of the present ministers, whatever other persons he chose, prevailed upon the Marquis of Rockingham to join him in the endeavour to form a new cabinet. The result was, that on the 10th of July, the Marquis of Rockingham was gazetted as First Lord of the Treasury, and the Honourable H. S. Conway and the Duke of Grafton, as the two Principal Secretaries of State. The most important of the other new appointments were, the Earl of Winchelsea as President of the Council, the Duke of Newcastle as Lord Privy Seal, and Mr. William Dowdeswell as Chancellor of the Exchequer. The Earl of Northington was continued as Lord Chancellor, and the Earl of Egremont as First Lord of the Admiralty. The Duke of Portland succeeded Earl Gower as Lord Chamberlain; and some other new appointments were also made in the inferior offices of the Household. The subordinate seats at the Boards of the Treasury, Admiralty, and Trade, were also for the most part filled with new men. It was on this change, that the afterwards celebrated Edmund Burke was introduced to public life, being appointed Private Secretary to the Premier, and brought into parliament for the borough of Wendover.

The confidence of the late ministers in their stability, had continued up to the last moment. "So blind were they to their true situation," observes the editor of Walpole's Letters to Lord Hertford, "that Mr. Rigby, who was as deep as any man in the ministerial councils, writes to a private friend—'I never thought, to tell you the truth, that we were in any danger from this last political cloud. The Duke of Cumberland's political system, grafted upon the Earl of Bute's stock, seems of all others the least capable of succeeding.' This letter was written on the 7th of July, and on the 10th the new ministry was formed."

[To be continued.]

REPORT FROM THE CHURCH COMMISSION.

The first Report from the Church Commission, which is dated the 17th of March, has just been printed.

Under the first head of 'Territory,' the Commissioners propose various alterations of the boundaries of the existing dioceses, the union of the sees of Llandaff and Bristol, and of those of St. Asaph and Bangor, and the erection of two new sees in the province of York, one at Manchester and the other at Ripon.

We present at length the second head of the Report, with the tables appended to it.

"REVENUE.

"In considering the subject of episcopal revenues, we have been materially assisted by the returns made to the commissioners appointed under a commission issued by your Majesty in the year 1832, and extended in the years 1833 and 1834, for inquiring (amongst other things) into the 'revenues and patronage belonging to the several archiepiscopal and episcopal sees in England and Wales.'

"These returns generally present the average of three years ending the 31st of December, 1831; but in some instances they contain corrections to a later date.

"As the greater part of the episcopal revenues arises from fines on the renewal of leases, of which some are granted for three lives, renewable when a life drops, and others for twenty-one years, renewable every seven, and in towns for forty years, renewable every fourteen, it is manifest that a period of three years is too short to exhibit a correct average of the annual value of the several sees; and that an average so taken will show an excess, where large fines have recently accrued, and a deficit where no fine, or an unusually small amount of fines has been received. But as this point has been adverted to by the bishops in estimating the pro-

bable increase or diminution of the incomes of their respective sees, we may venture to refer your Majesty to the following table, framed from those returns, as containing information sufficiently accurate for the purposes of this report.

Net Income on 3 years' average, ending Dec. 31, 1831.	Probable Causes of Increase or Diminution.	Estimated future net Income.
£.	DIOCESE.	£.
19,182	*Canterbury.*—Expected increase of 1544*l.*, shown by the following statement:—From fines, 1361*l.*, and from the diminution of the expenses of farm-buildings, repairs of 400*l.* £.1,766 Deduct therefrom in respect of yearly allowance to be henceforth made to lessees of estates of the see, for reversionary augmentations, to the amount of 1040*l.*, granted by the Archbishop to poor livings in the patronage of the see . . 222 £.1,544 One-fortieth part of a sum of 60,000*l.*, borrowed on mortgage under an act of Parliament for rebuilding Lambeth Palace, and making additions to the mansion at Addington, is payable yearly, with interest on the principal remaining unpaid. The present yearly payment amounts to 3,780*l.*, including interest, which will decrease at the rate of 60*l.* every year. The last payment will be in 1873.	17,060 gradually increasing to 20,700 in 1873
12,629	*York.*—The average annual amount of fines on renewals for the three years ending Dec. 31, 1831, exceeded, from particular circumstances, the usual average by at least 2000*l.*, and there will be a further decrease of about twenty per cent. in the amount of the proceeds of the estates generally, from the diminution of the value of agricultural produce; the income of the see will also be further reduced by augmentations of the small livings in the patronage of the Archbishop, about to be made, in addition to those already granted.	10,600
13,929	*London.*—It is expected that there will be a decrease in the future average income arising from fines upon the renewals of leases for lives, and from woods and manorial profits, to the amount together of 1725*l.*, and a further decrease from intended augmentations of the livings in the patronage of the see, in addition to those already made. Besides which, one-twentieth part of the sum of 10,000*l.*, borrowed on mortgage for rebuilding London House, is payable yearly, with interest on the principal remaining unpaid. The last payment will be in 1839.	12,204 after 1839
19,066	*Durham.*—No accurate judgment can be formed as to the future average amount of fines on the renewal of leases of mines and quarries, as the profits attending them must depend principally upon the several districts in which the collieries will be worked. Since the above return, the Bishop has granted permanent augmentations to small livings in his patronage to the amount of 1170*l.* per annum out of the revenues of the see. No other ground for expecting increase or decrease.	17,890
11,151	*Winchester.*—The augmentations already made of small livings in the patronage of the see, will reduce the annual income by about 400*l.* It is intended further to augment all the small livings in the gift of the see to 200*l.* per annum. Except in respect of augmentations, there are no grounds for expecting that the future income will vary materially from the sum stated.	10,750
6,300	*St. Asaph.*—The greater part of the income of the see arises from tithes, which have gradually declined since 1827, when they amounted to 6636*l.* By a supplemental statement it appears that the produce of the tithes was in 1834, 5214*l.* which is below their average for the three years ending in 1831, by the sum of 607*l.*, and that the produce of the mines was in the same year 263*l.*, which is less than the same average by the sum of 415*l.*, showing the income of the year 1834 to be below the average stated by the sum of 1022*l.*; and there seems to be no prospect of improvement.	5,280
4,464	*Bangor.*—By a supplemental statement it appears that the tithes in the years 1833 and 1834 have fallen below the average of the three years ending Dec. 31, 1831, by 650*l.*, or about that sum, and there is no prospect of increase. The average of fines is not expected to be more than 250*l.*, for many years to come.	3,814
5,946	*Bath and Wells.*—The net income is expected to be reduced to about 5500*l.* per annum, by the probable diminution of fines upon renewals.	5,500
2,351	*Bristol.*—The average upon the three years ending Dec. 31, 1831, much exceeds the usual average. The living of Almondsbury, permanently annexed to the see, is not expected to vary in amount	2,350
2,213	*Carlisle.*—From an unusual receipt of fines on renewal of leases for lives, the gross annual income of the see on the last bishop's incumbency was about 3500*l.*; upon some late surveys the estimated annual value of the property has been less than on former valuations. Upon the whole, the gross yearly value of the see, which in 1832 was returned at 2585*l.*, may be estimated, upon an average of seven years, at 3000*l.* It should also be stated that one-twentieth part of a sum of 10,000*l.*, borrowed on mortgage for repairing and partly rebuilding Rose Castle, is payable yearly, with interest upon the remaining principal. The payments will cease in the year 1853.	3,000 after 1853
3,261	*Chester.*—Decrease expected, as the property of the see chiefly consists of tithes, which are falling in value.	3,260
4,229	*Chichester.*—The average amount of fines on renewals for the three years ending Dec. 31, 1831, was greater than the general average receipts under that head. It is considered that the computed average income will be reduced by 400*l.* or 500*l.* per annum.	3,800
1,897	*St. David's.*—The average yearly receipts from fines on renewals of leases for three years, ending Dec. 31, 1831, were 214*l.*, whereas the average of the last ten years is 1150*l.* per annum; but this last-mentioned average cannot be depended upon in future.	2,800
11,105	*Ely.*—The estimate of the last three years is rather more than the average amount of the net annual produce of the see: as the two last years, particularly 1830, afforded fines for renewal of leases which seldom occur.	11,000
2,713	*Exeter.*—There will in future be 21*l.* per annum from the dividends on stock produced by the sale of houses under a local act. In other respects no increase or decrease is anticipated.	2,734
2,282	*Gloucester.*—A decrease in the revenues of this see will take place in consequence of the augmentation of small livings in the patronage of the see, made by the present Bishop. The amount of fines for renewals, included in this estimate, exceeds the average of the seven years preceding.	2,200
2,516	*Hereford.*—No expected increase or decrease	2,516
3,923	*Lichfield and Coventry.*—If the average of fines, as far as it can be ascertained from accessible documents, were to be taken upon a	4,350

Net income on 3 years' average, ending Dec. 31, 1831. £.	Probable Causes of Increase or Diminution.	Estimated future net Income. £.
	DIOCESE.	
	period of twenty-one years, it would exhibit a net income considerably larger than that which has been stated, but a material reduction of the future amount of fines is to be expected from the progressive diminution of the value of land. A decrease of the profits from woods is expected. The income will also be decreased by the augmentation of poor livings in the gift of the see intended to be made. Upon the whole it is considered, that at a distant period, the net income may average 4350*l.* per annum.	
4,542	*Lincoln.*—The estimate taken upon the three years ending Dec. 31, 1831, exceeds the average of the three subsequent years by the sum of 680*l.* The property consists almost entirely of impropriate rectories, with dependent vicarages, the intended augmentations of which, in virtue of the late acts, will cause a further considerable diminution of the net annual proceeds.	4,200
924	*Llandaff.*—It is considered that upon a sufficiently extended average, the income from fines, which is stated at 73*l.*, might be taken at 400*l.* per annum; a corresponding increase of income is therefore expected.	1,250
5,395	*Norwich.*—The average amount of income, taken upon the three years ending Dec. 31, 1831, exceeds the average annual value of the revenues of the see, if computed upon the receipts for the last seven years, by the sum of 700*l.* per annum; and there will be a reduction of income by the augmentation of small livings in the gift of the see.	4,700
2,648	*Oxford.*—A decrease in the revenues of the see must be expected. The average of fines on renewal of leases for the three years ending Dec. 1, 1831, is found on calculation to exceed the average receipts from the same source which may reasonably be expected in future by about the sum of 1060*l.*, and a deduction of 90*l.* must be allowed for the depreciated value of tithes in hand. If the Crown shall be pleased to renew a lease granted on account of the small revenues of the see, which will expire in the year 1837, it is expected that *communibus annis*, the net value of the see will amount to 1658*l.*, or about that.	1,658 subject to the contingency stated in the preceding column.
3,103	*Peterborough.*—The total receipts may be expected to be less in future than the average of the three years ending in 1831, as the fines upon renewals of leases, as well as the tithes of Castor, a rectory permanently annexed to the see, are continually decreasing in the amount.	3,000
1,459	*Rochester.*—No expected increase or decrease.	1,459
3,939	*Salisbury.*—If the calculation were taken upon an average embracing a period of years in which it is probable that most of the leases for lives as well as for years would be renewed, the result would exhibit a net income, *communibus annis*, of not less than 5000*l.*, or between that sum and 6000*l.* per annum.	5,000
5,569	*Worcester.*—There is reason to expect a decrease of income, from the diminution of the amount of fines upon the renewal of leases.	6,500

"According to the foregoing table, the net income of all the bishoprics of England and Wales, in the year 1831, amounted, on an average of three years, to the sum of 157,737*l.*, and may now be calculated at about, 148,875*l.*; but it appears that this amount is very unequally distributed, the incomes of one half of the bishoprics falling below the sum necessary to cover the expenses to which a bishop is unavoidably subject. A different distribution of the episcopal revenues is the natural remedy of this inconvenience. Incomes must also be provided for the two new sees which are to be erected.

"If the total amount of the net income of the bishoprics, as stated in the second column of the preceding table, had been liable to no further diminution, we apprehend that these objects might have been nearly accomplished by such a distribution, without any addition to these incomes by means of commendams, either with or without cure of souls; the former of which additions we think ought to be altogether discontinued.

"This might be done by enabling the future incumbents of the richer sees either to transfer part of the estates to the poorer bishoprics, or to pay over annually a portion of their incomes to the governors of Queen Anne's Bounty, to be applied to the augmentation of such bishoprics; or either of these modes might be adopted, according to the particular circumstances of each case.

"The total amount, as above stated, cannot be, however, considered as the future income, for the reasons alleged in the third column, which shows a diminution of nearly 9000*l.* per annum; and a further diminution is also to be expected from the application, either in whole or in part, of impropriations, which form a considerable portion of the incomes of many bishoprics, and which in most instances they were compelled to accept in exchange for manors and estates, for the improvement of populous and poorly endowed vicarages and curacies connected with them.

"The total income of the bishoprics in England and Wales will thus no longer be sufficient to afford an adequate income to each bishop, merely by a different arrangement; and the most obvious mode of supplying the deficiency will be permanently to annex to some of the poorer bishoprics certain cathedral preferments, particularly in the chapters of St. Paul's and Westminster, on account of their position in the metropolis.

"In considering the incomes of the archbishops and bishops, it is proper to advert not only to the expenses necessarily incurred in journies for the purposes of confirmation, consecration, and other official duties—in maintaining antient and extensive houses of residence—in keeping hospitality—and in contributing to all objects connected with religion and charity, in a manner suitable to their station; but to a burden which presses heavily on newly-promoted bishops, who are seldom men of wealth. The unavoidable expenses attending their appointment are so considerable that they may be calculated at the income of one year in the most of the sees, and at much more than a year's income in the smaller ones.

"Upon the whole, we are of opinion, that where the annual income of a bishop amounts to 4500*l.*, it is not necessary to make any addition: nor would we recommend any diminution unless it exceed 5500*l.* But we think that the two archbishoprics, and the bishops of London, Durham, and Winchester, ought to have a larger provision than the rest.

"These arrangements, if carried into effect, will tend to promote the desirable object of diminishing the frequency of translation."

APPENDIX. No. I.

Present condition of the several Dioceses in England and Wales with reference to the Number of Benefices and to Population:—

Diocese.	Number of Benefices.	Population.
PROVINCE OF CANTERBURY.

PARLIAMENTARY REGISTER.

LIST OF BILLS BROUGHT IN.

(*Exclusive of Private Bills.*)

HOUSE OF LORDS.

Bills which have received the Royal assent:

1. Exchequer Bills.
2. Transfer of Aids.
3. Newspapers Printers' Relief.
4. Chester Criminals Execution.

Bills brought in:

Feb. 26. A Bill to prevent non-residence of clergy.—*Lord Brougham.*

— A Bill to prevent spiritual persons in England and Ireland from having more preferments than one.—*Lord Brougham.*

— 27. A Bill for the abolition of oaths.—*Duke of Richmond.*

Mar. 2. A Bill to indemnify the governor-general and other persons in respect of certain acts done in the administration of the government of the British territories in the East Indies, subsequent to the 22nd April, 1834, and to make those acts valid—*Lord Ellenborough.*

— 10. A Bill for altering and amending the law regarding commitments by courts of equity for contempts, and the taking bills *pro confesso* in Ireland; and also,

A Bill to extend to Ireland certain provisions of an act made and passed in the first year of His Majesty's reign, entituled, "An Act for consolidating and amending the laws relating to property belonging to infants, femes covert, lunatics, and persons of unsound mind."—*Lord Chancellor.*

— 13. A Bill to consolidate the several ecclesiastical jurisdictions in England and Wales, and to enlarge the powers and authorities of such consolidated jurisdictions, and to alter and amend the law in certain matters ecclesiastical—*Lord Brougham.*

— 20. A Bill to authorise the Court of Directors of the East India Company to suspend the execution of the provisions of the Act of 3 & 4 Will. 4. c. 85, so far as they relate to the creation of the government of Agra.—*Lord Ellenborough.*

HOUSE OF COMMONS.

Feb. 27. Chester Criminals' execution Bill "to explain an Act of the first year of his present Majesty, for the more effectual administration of justice in England and Wales, so far as relates to the execution of criminals in the county of Chester."—*Mr. Jervis.*

5. Imprisonment for Debt.—Bill to abolish imprisonment for debt, except in cases of fraud, and to amend the law of debtor and creditor.—*Sir John Campbell.*

— Wills' execution.—Bill for the amendment of the law with respect to the execution of wills.—*Sir John Campbell.*

— Executors and Administrators.—Bill to amend the law relating thereto.—*Sir John Campbell.*

6. Copyholds.—Bill to facilitate the enfranchisement thereof.—*Sir John Campbell.*

9. Newspapers regulation Bill "to amend an act of the 38th Geo. III., for preventing the mischiefs arising from the printing and publishing newspapers, and papers of a like nature, by persons not known, and for regulating the printing and publishing of such papers in other respects, and to discontinue certain actions commenced under the provisions of the said act."—*The Solicitor-General.*

8. Court of Session Establishment (Scotland)—Bill for making certain alterations and reductions in the establishment of clerks and officers attached to the Court of Session in Scotland, and to diminish the expense of judicial procedure in that court—*The Lord Advocate.*
— Imprisonment for Debt (Scotland)—Bill for abolishing in Scotland imprisonment for civil debts of small amount, and for rendering more available the process of *cessio bonorum*, and restraining the arrestment of wages—*The Lord Advocate.*
10. Illegal Securities.—Bill to amend the law relating to securities given for gaming, usurious, and certain other illegal transactions.—*Mr. Rolfe.*
12. Witnesses Indemnity.—Bill to indemnify witnesses giving evidence before Parliament in cases of bribery.—*Mr. W. H. Ord.*
13. Registration of Voters.—Bill for the more effectual registration of persons entitled to vote in the election of members to serve in Parliament in England and Wales.—*Lord John Russell.*
— Lord Day's Observance.—Bill to promote the better observance of the Lord's day.—*Mr. Poulter.*
16. Bankrupts' Estates.—Bill to apply the interest thereof in discharge of expenses of the Court of Bankruptcy.—*The Master of the Rolls.*
18. Merchant Seamen Bill, "to amend and consolidate the laws relating to the merchant seamen of the United Kingdom, and for forming and maintaining a register of all the men engaged in that service."—*Sir James Graham.*
— Seamen Enlistment Bill, "for the encouragement of the voluntary enlistment of seamen, and to make regulations for more effectually manning his Majesty's navy."—*Sir James Graham.*
19. Colonial Passengers Bill, "to repeal an act of the ninth year of his late Majesty, for regulating the carriage of passengers in merchant vessels from the United Kingdom to the British possessions on the continental islands of North America, and to make further provision for regulating the same."—*Mr. W. E. Gladstone.*
20. Political Franchise.—Bill to protect the free exercise of the political franchise.—*Mr. Poulter.*
— Highways.—Bill for the amendment and consolidation of the laws relating to the highways in England and Wales.—*Mr. Shaw Lefevre.*
23. Registration of Births, &c. (Scotland)—Bill to establish an uniform system of registration of births, marriages, and deaths, in Scotland.—*Mr. Robert Steuart.*

LIST OF COMMITTEES APPOINTED.

(*Exclusive of Committees to consider Bills.*)

House of Lords, 1835.

Feb. 25. Committee "to consider of the causes in which prints of the appellants' and respondents' cases now depending in this House, in matters of appeals and writs of error, have not been delivered pursuant to the standing orders of this House."
27. Committee "to consider of some additions to the library of this House, and of other matters relating thereto."
— Committee "to consider of the proceedings had in execution of the measures recommended in the reports of the Lords' committees upon the office of clerk of the Parliaments in the sessions 1824 and 1826."
March 3. Committee "to consider and report upon such plan as may be most fitting and convenient for the permanent accommodation of the Houses of Parliament."
24. Committee "for the purpose of inquiring into and reporting upon the present state of the several gaols and houses of correction in the counties, cities, and corporate towns within England and Wales, upon the rules and discipline therein established, with regard to the treatment of unconvicted, as well as convicted prisoners; and also, whether the sentences under which convicted prisoners are confined, are, or can be, therein properly or efficiently carried into execution; and farther, to report whether any and what regulations appear to be necessary in the laws now in force, for the government and regulation, or in the construction of such gaols and houses of correction, in order to ensure an uniformity of discipline throughout the whole, as well as the proper and efficient execution of such sentences."

House of Commons, 1835.

February 25. Committee, "to whom shall be referred all reports from committees on petitions for private bills, in which it shall be stated that any of the standing orders of this House have not been complied with."
— Committee on expiring laws, for the purpose of inquiring into what temporary laws of a public and general nature are about to expire during the present session, or at any period intervening between the termination of the present session and the assembling again of Parliament.
March 2. Committee "to consider and report upon such plan as may be most fitting and convenient for the permanent accommodation of the Houses of Parliament."
— Committee of sixteen members (renewed at the commencement of each session) to assist Mr. Speaker in the direction of the Library.
3. Committee for classifying and arranging all petitions presented to the House, with the exception of such as complain of undue returns, or relate to private bills.
5. Committee "to take into consideration the best mode of publishing correct and authentic lists of the divisions."
— Committee "to consider the military establishments and expenditure of the British empire in the colonies, in completion of the inquiry commenced in the last Session of Parliament."
6. Committee "to consider the manner in which the journals, bills, and papers are prepared and printed for the use of both Houses of Parliament, their numbers, expense, distribution, and quantity in store, the number of Acts of Parliament printed for the use of both Houses of Parliament, and for the public service, their expense and distribution; also, those for the use of the public, and the prices at which sold, and the establishment requisite for conducting the same; to consider whether any and what alteration can be made in the existing system, with benefit to the public."
9. Committee "to examine the petitions presented to this House (during the last and previous sessions) from the hand-loom weavers, and to report their observations thereon to the House," in continuation of the labours of the committee of last session.
11. Committee "to consider the most effectual means of preventing bribery, corruption, and intimidation, in the election of members to serve in Parliament."
17. Committee "to inquire into the present state of the education of the people in England and Wales, and into the application and effects of the grant made in the last Session of Parliament for the erection of school-houses, and to consider the expediency of further grants in aid of education, and to report their observations thereupon to the House."
17. Committee "to inquire into the amount of advances made by the commissioners of public works in Ireland, the regulations under which they were made, the purposes to which they have been applied, and the amount of repayments; to consider also the various reports made by committees and commissioners on the subject of reclaiming waste lands in Ireland, and to what extent the suggestions which they contain have been complied with."
18. Committee "to examine into the provisions of the act of last session for establishing uniformity of weights and measures, and to consider of such amendments in that act as may be calculated to carry its objects more fully and satisfactorily into effect."
24. Committee "to inquire into the nature, character, extent, and tendency of Orange Lodge Associations or Societies in Ireland, and to report their opinion thereon to the House."
[Names of the members of this committee:—Mr. Finn, Mr. O'Connell, Mr. Sheil, Mr. Wyse, Mr. Jackson, Lord Viscount Ebrington, Mr. Wilson Patten, Mr. Pease, Mr. Bethel, Mr. Edward Buller, Mr. Cutlar Fergusson, Colonel Wood, Mr. Ed. John Stanley, Mr. Fox Maule, Lord Viscount Castlereagh, Mr. Bannerman, Mr. Shaw, Mr. Spring Rice, Mr. Maxwell, Mr. Ward, Mr. Nicholl, Mr. O'Loghlen, Mr. Alexander Pringle, Sir James Graham, Sir John Yarde Buller, Colonel Connolly, and Colonel Perceval.—Mr. Shaw and Colonel Perceval have been discharged from farther attendance, and Mr. Finch and Mr. Grove Price added to the committee.]
24. Committee "to take into consideration the petition of the electors of Chatham, complaining of the conduct of Colonel Tremenheere."
— Committee "to inquire into sinecure offices in the colonies, and into the returns ordered by the House on the 24th of February, 1834, of all compensations for sinecure offices and civil offices abolished, and to report their observations thereupon to the House."

PUBLIC PETITIONS.

[The Committee for arranging and classifying public petitions presented to the House of Commons, consists of the Chancellor of the Exchequer, Mr. James Oswald, Mr. O'Connell, Sir Robert Inglis, Sir Richard Vyvyan, Mr. Wilson Patten, Mr. Hume, Sir Edward Knatchbull, Mr. Littleton, Mr. Clay, Mr. Tooke, and Mr. Green.

"*Memorandum:*—Resolved, that every member presenting a petition to the House do affix his name at the beginning thereof."]

Four reports have been issued, the fourth being dated the 13th March, 1835.

POLITICAL RETROSPECT FOR MARCH, 1835.

GREAT BRITAIN.

The first month of the Parliamentary Session has been distinguished by a busy succession of interesting discussions and events.

On the 24th of February, the Address in answer to his Majesty's Speech was carried in the Lords without a division, and even without any amendment being proposed, but not without a debate of considerable length. It turned almost entirely upon the late change of administration, and the chief speakers were Lord Melbourne, the Duke of Wellington, Lord Brougham, and the Lord Chancellor; but no disclosures of much importance were made. The Duke of Richmond and the Earl of Ripon expressed their intention of supporting the new government in so far as they could approve of its measures, though they could not give it their confidence.

The same evening, in the House of Commons, the Address was moved by Lord Sandon, and seconded by Mr. Bramston; after which Lord Morpeth moved, that in room of the two concluding paragraphs should be substituted words expressing a trust that his Majesty's councils would be directed in the spirit of well-considered and effective reform—that in the same liberal and comprehensive policy which had dictated the reform of the representation and the abolition of negro-slavery, the Municipal Corporations would be placed under vigilant popular control, all the well-founded grievances of the Protestant Dissenters removed—and the abuses in the Church, which impair its efficiency in England, and disturb the peace of society in Ireland, corrected—and also representing to his Majesty, that his Majesty's faithful Commons begged leave submissively to add, that they could not but lament that the progress of these and other reforms should have been unnecessarily interrupted and endangered by the dissolution of the late Parliament. This amendment, having been seconded by Mr. Bannerman, gave rise to a debate, which lasted for three nights. The principal speakers for the original Address were, Mr. Pemberton, Mr. Richards, Sir Robert Peel, Mr. Robinson, Lord Stanley, Mr. Praed, Mr. Goulburn, Mr. Sergeant Goulburn, and Sir James Graham; and for the Amendment, Mr. Grote, Mr. Poulter, Mr. Ward, Dr. Lushington, Lord John Russell, Mr. Harvey, Mr. Fox Maule, Mr. Gisborne, Lord Howick, Mr. T. Duncombe, and Mr. O'Connell. When the House divided on Thursday night, the numbers appeared to be, for the Address, 309; for the Amendment, 316: thus giving the Opposition a majority of 7 over the ministry. Immediately after the division, Sir Robert Peel intimated that it was possible he might take the sense of the House again on the question of bringing up the Report; but on the following evening he stated, that, after having made inquiries, he was convinced he could not succeed in that attempt. It is understood that Lord [illegible]y and his friends, who had, in the division, voted with [illegible]ers, would not have gone with them in trying to re[illegible] the decision to which the House had come. In the course of the debate, Lord Stanley said that he would go the whole length of the amendment upon the subject of Corporation Reform; and that the omission of any particular notice of that subject, both in the Speech from the Throne, and the exposition of the intentions of the new ministry which had been given to the House by Sir Robert Peel, led him to look upon the government with greater jealousy than he otherwise should have done. Lord Howick said, that he did not consider that the necessary effect of carrying the Amendment would be to remove the present administration from office; he should scarcely give the vote he intended to give, if it were to have that result. But, although he did not wish for the immediate retirement of Sir Robert Peel and his colleagues, he should regard it as a great calamity if the present government should continue without any change.

The Address of the Commons was presented to his Majesty on Saturday, the 28th. In his answer, his Majesty expressed his thanks for the assurances contained in the Address of the disposition of the Commons to co-operate with him in the improvement, with a view to the maintenance, of our institutions in Church and State. He then added, "I learn with regret that you do not concur with me as to the policy of the appeal which I have recently made to the sense of my people. I never have exercised, and I never will exercise, any of the prerogatives which I hold, excepting for the single purpose of promoting the great end for which they are entrusted to me—the public good: and I confidently trust that no measure, conducive to the general interests, will be endangered or interrupted in its progress by the opportunity which I have afforded to my faithful and loyal subjects, of expressing their opinions through the choice of their representatives in Parliament."

When this answer was reported to the House on Monday, Mr. Hume contended that no thanks ought to be returned for it; but he did not persist in his objection.

The same evening, on the order of the day being read for the House going into a Committee of Supply, Sir Robert Peel stated, in answer to questions put to him by Lord John Russell, that he had not felt it his duty, in consequence of the vote on the Address, to tender his resignation—that, with respect to the Irish Church, he remained of opinion that ecclesiastical property ought not to be diverted from strictly ecclesiastical purposes, but that any measures, not inconsistent with that principle, which might be recommended by the Church Commissioners appointed by the late government, should have his best consideration—that he had no motive, or intention, to obstruct Corporation Reform—and, finally, that as to the rumours about another dissolution of Parliament, and the alleged intention of the government, in case the Mutiny Bill should not pass, to keep up a standing army in defiance of Parliament,—the first he had never sanctioned, either directly or indirectly, and the second he had never heard a whisper of, until he had heard it from Lord John Russell's own lips.

On the following evening a discussion of considerable length took place on a motion made by Mr. O'Dwyer, for the production of a copy of any order recently issued to officers commanding troops in Ireland, directing that, in the event of any collision between the King's troops and the populace, the practice of firing over the heads of the peasantry should be discontinued, and that the troops should always fire with effect. The motion was resisted by ministers, and also by Mr. Littleton and other members of the Opposition; and it was eventually withdrawn, on the understanding that effectual steps would be taken by the government to give publicity to the order in some other way.

Mr. Gisborne then moved, "That in all cases in which an election shall be declared void, on the ground of bribery or treating, it is expedient that the expense of the petitioners should be borne by the public." The resolution was opposed by the Attorney-General, Mr. Wynn, and Sir Robert Peel; and supported by Sir John Campbell and Mr. Hume. It was at last withdrawn by the mover for the present.

In answer to a question by Sir John Campbell, the Attorney-General stated that he would shortly move for leave to bring in a bill for the administration of justice in England, which, he believed, would meet the views of the public as to the establishment of local courts.

The greater part of the evening of Wednesday the 4th, was occupied with a discussion which arose on a question asked by Mr. Finn, as to whether it was true that 182 addresses from Orange societies had been presented to his Majesty on the 26th of February, and answers returned to the parties stating that the addresses had been most graciously received? The question appeared to take ministers by surprise—and the only defences they offered to the charge of having returned such answers to the addresses of associations alleged to be illegal were, first, that the illegality of the Orange Lodges had never been judicially declared; and secondly, that the addresses had been received and answered merely according to the usual forms. On the following Friday the subject was again brought forward by Mr. Sheil, who moved for the production of copies of the addresses alluded to, and also for a copy of a letter written by Lord Manners when Chancellor of Ireland, relative to the illegality of Orange societies, and for the opinions of the Irish Attorney-General and Solicitor-General on the same point. The latter part of the motion was resisted by ministers, and was eventually withdrawn; the production of the addresses and answers was agreed to.

After the above-mentioned conversation on Wednesday, a division took place, in a Committee of the whole House, on an amendment moved by the Attorney-General to the Chester Criminals Execution Bill. The amendment was carried by a majority of 115 to 55.

In the House of Lords on Friday the 6th, Lord Radnor moved for copies of the oaths taken at the universities of Oxford and Cambridge; and the motion gave rise to some discussion, in the course of which the practice of the universities was condemned by Lord Brougham, and defended by the Duke of Wellington and the Bishops of Llandaff and Gloucester. The motion was agreed to; but Lord Radnor has since intimated his intention of not pursuing the matter further for the present in consequence of its having been taken up by the universities themselves.

On Monday the 9th, in the House of Commons, the Great Western Railway Bill having been read a second time without opposition, the Marquis of Chandos divided the House on its committal, when the numbers appeared to be for the committal, 165; and against it, 0.

Mr. Roebuck afterwards, on presenting a petition from certain members of the Legislative Council and of the House of Assembly of Lower Canada, entered at considerable length into the grievances complained of by many of the inhabitants of that province; and in the course of the discussion which followed, Sir Robert Peel stated that it was the intention of the Government immediately to send out a Commissioner to the colony to inquire on the spot into the state of matters, with a view to their adjustment on fair and equitable terms.

This evening the Solicitor-General brought in a bill to indemnify those proprietors of newspapers who had omitted to comply with certain of the regulations contained in an act of the 38th George III. respecting the printing and publishing of newspapers, from penalties which they had thereby incurred. The bill received the warm approbation of all parties.

On Tuesday the 10th, in a very full House, the Marquis of Chandos, pursuant to notice, proposed his resolution for the Repeal of the Malt Tax. The debate that followed lasted till nearly one o'clock in the morning. When the House at length divided, the numbers were—for the resolution, 192; and against it, 350. On this occasion most of the adherents of the late ministry voted in the majority; Mr. Charles Wood declared that he was happy to give the present government the same support which he and his friends had, in similar circumstances, received from Sir Robert Peel. Several members also voted with ministers who had either expressly pledged themselves at their election to take a different side, or had at least led their constituents to believe that they would. This led Mr. Spring Rice to remark that those pledges certainly were awful things; even when honestly meant; they might sometimes be given in ignorance, and could not be redeemed by members without a gross violation of the duties they owed to the community at large. Sir Roger Griesley frankly stated that, pledged as he was to vote for the repeal, he considered himself bound to oppose the motion on the single ground that the inevitable result of its being carried would be the dissolution of the present ministry. The honourable member the next day published an address to his constituents, in which he attributed the determination he had taken to a kind of prophetic inspiration which he could not explain, but which had before occurred to him, and had this time come on after he had passed the whole night between Sunday and Monday without sleep, and in deep and anxious reflection. The Marquis of Chandos's resolution was warmly supported by Mr. Hume.

On Wednesday, Mr. Hume, who had on a former day given notice that he would move at the proper time that the grant of the supplies should be limited to six months, and had afterwards amended his notice by limiting the term to half that length, intimated, in answer to a question from Sir Robert Peel, that either he himself or another member would certainly make the motion in the latter form on the Friday following.

A division then took place on a motion which had been made by Mr. Ewart, that the consideration of no new business should be in future proposed after eleven o'clock at night. The motion, which was opposed by Sir Robert Peel, and supported by Mr. Hume, Mr. O'Connell, and others, was negatived by a majority of 130 to 65.

In the latter part of the evening, various bills, most of which we shall have occasion to notice in a later stage of their progress, were allowed to be brought in, or read a first or second time, without opposition.

On Thursday Mr. Alderman Wood moved the second reading of a Bill for enabling the Corporation of London to improve Smithfield Market; but we rejoice to say that this attempt to perpetuate one of the greatest nuisances in the metropolis was signally defeated, the measure being thrown out by the decisive majority of 142 to 27.

Mr. Hume then rose, and remarked that he had answered the question put to him the day before by Sir Robert Peel only conditionally, and that he had now to state that no motion for limiting the supplies to a short period would be brought forward. The reason which the honourable member assigned for this change of purpose was, that his friends did not consider such a motion would be sufficiently expressive of the want of confidence felt by the House in his Majesty's Ministers. He added that, on some subsequent occasion, the question of a want of confidence would be brought forward in a more decisive manner. In answer to Sir Robert Peel, he afterwards said that no such question would be brought forward in any shape on the day following, but that if it rested with himself there should be no delay in proposing it. "At all events," he concluded, "it will be brought forward on the very first fit and proper moment that occurs."

The Attorney-General then announced the plan of the Government for the improvement of the administration of justice in ecclesiastical causes, and obtained leave to bring in a bill for effecting it. The principal feature of this proposed reform is the abolition of all the existing ecclesiastical courts, and the establishment of a single new general court to sit in London. The measure received the warm commendations of Sir John Campbell, Dr. Lushington, and Mr. Cutlar Fergusson. Mr. Hume maintained that the present Government deserved no credit for bringing it forward; Sir Robert Peel, he said, had merely crept into the seat of

case of need. Are the affairs of the Queen and Constitutionalists so prosperous that they can be left to go alone? Is Don Carlos so far from the Biscayan provinces that the coasts thereof may be left open with safety? If England thus declares off, the rest of them will not believe there is any blockade at all, and the first to run in with warlike stores for Don Carlos, if he or his foreign agents can only find money to buy them, will be our own British merchantmen.

Spain has also had her partial changes of Ministers. We mentioned last month the retirement of Llauder the Minister of War, who has been succeeded by General Valdez. Señor de la Dehesa has been named Minister of Justice, and Señor Medrano (*ad interim*), Minister of the Interior. It has, however, been carefully announced that these changes do not involve any alteration in the policy of the Cabinet. We wish they might imply some change in its action and some improvement in promptness and decision; but it is hard judging of a ministry hampered by conflicting prejudices on the one hand, and by a beggared exchequer on the other.

On the 22nd of February the small town of Los Arcos, with 250 prisoners, 500 muskets, and a considerable number of powder-bags, and soldiers' great coats, was taken by Zumalacarreguy. The Carlists have also continued to annoy Elisondo, but have not succeeded in capturing that place, weak and almost contemptible as it is. There are also reports of other bush-fights, where the advantages have been all for the Queen; and it is said, that in a skirmish of some consequence, during which old Mina mounted his horse and charged at the head of his cavalry, the Carlists were completely beaten We regret to see that the civil war, spreading beyond Navarre and the Biscayan provinces, is making progress in Catalonia. The notorious priest, Merino, whom, on the authority of the Madrid papers, we reported dead last month, has come to life again, and is fighting away for the cause of Don Carlos and absolutism with as much clerical unction as ever.

A pamphlet has recently appeared in France, entitled, "Legitimacy, the only Salvation for Spain." It seems to be a silly affair enough! The writer, whose talents are worthy of the cause he advocates, pretends to give an authentic account of Don Carlos's mysterious disappearance from London—his journey through France—and apparition on the other side of the Pyrenees; and in all this he attempts to attach the same personal romantic interest to the Don, that old General Dermoncourt (or rather a clever man of letters for him), bestowed on the Duchess of Berry, during her *scapade* in the Vendee. The Duchess's romance ended in a '*Roman Comique*'); but we are afraid the pamphleteer will not be able to make the Don a hero of romance, at any time.—This writer says,

"On his arrival in England, the persecuted competitor for the Spanish throne resolved to redeem his pledge, given to the Royalists of Navarre and Biscay, before he left Portugal. A messenger from Zumalacarreguy met him at Portsmouth, and informed him of all that was passing in the Northern provinces.* * * * He had been advised to risk the chance of arriving by sea, and suitable vessels were prepared for him; but, exercising his own judgment, he preferred the risk through France. In the evening of the 1st he secretly left Gloucester Lodge by the garden gate, and entered a hackney-coach stationed in the road for his reception. He alighted at the residence of a gentleman in town, and in the secret, where his mustachios were cut off, and his hair, rather of a reddish cast, dyed dark brown. This operation *was performed by a lady*, who was very much affected, and *wept when she recollected the dangers to which the lineal descendant of Philip V. was about to expose himself.*"

This touching grief of the fair operator was met with smiles and jokes by "the lineal descendant of Phillip V." who by the way, was a very indifferent King, though the first of the Bourbon dynasty of Spain.

"The good King went through the innocent process of disguising his person with great good humour. He rallied the timid operatress, anticipated success in his design, and smiled when he thought of the disappointment of his enemies. 'Fortunately for me,' said the monarch, his countenance beaming with hope and confidence, 'they have never known my real character, and this will favour my project.'"

It was of course a fine part of his real character, that he should be thus gay and jocose, when on the point of embarking in an enterprise which was to prolong the curses of civil war in his native country, and cause the death and misery of thousands of his own countrymen. But let us hear the rest of this marvellous evasion-which, we doubt not, if things prosper with them, will some day be made an episode in an ultra-absolute epic poem.

"After a slight supper, provided with a travelling-dress and a French passport, the King quitted London at midnight in a post-chaise, with one companion, for Brighton. There he embarked for Dieppe, and reached Paris in safety. He stopped at the Hotel Meurice, dined with M. Jauge the banker, witnessed the performance of the opera of *Robert le Diable*, for a moment pondered upon the situation of that kingdom, *to the sovereignty of which he himself had collateral claims*, and departed for Bordeaux. Here he stopped an entire day, and travelled comfortably to Bayonne. He crossed the frontier at the time named by himself, and on the 11th was at the head of his brave Navarrese and Biscayan legions, safe in Elisondo. Several persons in London were in the secret of the King's departure; and to their credit it ought to be stated, that no mention was made of the occurrence, nor was it known till the French discovered that their vigilance had been baffled."

There is one position in all this most eminently dramatic, and that is where the disguised Don sits in a French theatre, listening to Robert the Devil, and dreaming of the French throne.

PORTUGAL.

In our last retrospect we said we doubted the reports which represented Don Miguel as having secretly left Italy, and returned to Portugal. At the end of February, having quitted Genoa, he was at Venice; and, as we are informed by the Vienna papers, which can state such solemn matters only by the sanction of Ministers, the Austrian Government had intimated to the Don its wish that he would not think of settling at Venice, or in any part of the Emperor's dominions.

The Portuguese Cabinet has also undergone some changes. The Bishop of Coimbra has resigned the Home Department, and been raised to the Chamber of Peers, his portfolio being taken by M. Agostino J. Freire, formerly Minister for the Marine. Count Villa Réal succeeds to Freire's place; the Count's, or that of the Foreign Office, being taken by Palmella. A bill brought in for the complete secularization of the monks and nuns of the suppressed orders has only been partially carried. Fearing to shock popular prejudices too much, the Cortes would not vote the monks free to marry, but the nuns are to take husbands if they can get them. A petition for dissolving the Chambers was thrown out by a very large majority. Marshal Saldanha and some other ultra-liberal Members who had previously signed it, having voted against it.

The Lower Chamber has passed votes of thanks to Admiral Sartorius, Colonel Hodges, and others, who, in a military and civil capacity, had done good service to Don Pedro and the Constitutional cause. But it has also carried a law of excessive severity and of a most extensive operation, depriving of all employments, pensions, honours, titles and decorations they may have obtained under Don Miguel, all such persons as presented petitions or representations to that prince to induce him to declare himself King; all such as signed the act of the Estates of the Kingdom, which confirmed him in his power; all such as accepted any office from his accursed government (*damnado governo*), to which they were not entitled in rotation; and all those generally who served him as magistrates, or abetted him in usurping the throne. A few mitigating clauses are extended to those persons who may have been *compelled* to serve the tyrant, and who afterwards espoused the cause of the young Queen Donna Maria; but the act as it stands bears upon an immense number of individuals, and must keep a large portion of that number in poverty and absolute want. The bill however was carried after a very short debate, during which only three dissentient voices were heard.

Ministers have got rid of the noisy Count Saldanha, by appointing him Ambassador at Paris. Some Miguelites have been arrested for uttering seditious cries, and two or three more of them have been assassinated. This imprudence on the one side, and vengeance on the other, seem to have been excited by a spurious proclamation, with Don Miguel's name affixed to it, announcing that the prince

would speedily return to Portugal, backed by the Holy Alliance. On the whole, however, Lisbon is considered as in a state of extraordinary tranquillity. Measures have been taken for the regular sweeping and cleansing of the streets, which used to be for the greater part surpassingly filthy, and even the great illuminator, Gas, is spoken of for the whole city.

SWITZERLAND.

This country is still kept in a state of uneasiness by her neighbours, on account of her persisting to afford refuge and protection to a number of Polish, German, Savoyard, and Italian political fugitives and exiles. On the 2nd of March, three regiments of Baden marched to Serrach, about four miles from the Swiss frontier, and posted themselves along the Rhine, from Basle to Courterun. This force, it is said, will be supported by Austrian, Bavarian, and Wurtemberg contingents; the whole to form a cordon.

The council of government of Zurich, has, as far as is compatible with honour, hospitality and independence, complied with the demands of the neighbouring governments, in ordering that—"All foreigners who shall establish or prepare political associations in our canton, shall be immediately expelled from it. Those who shall have taken part in deliberations, or participated in the violent disturbance of tranquillity in the neighbouring states, shall be arrested and delivered over to the tribunal to be tried and sentenced."

We wish all the other cantons would follow this reasonable example. The more excited party in Switzerland, we are aware, maintained that such measures will not satisfy the despotic powers who aim at coercing the free Swiss in many other points. But let them give up what is reasonable and just, and then they will be able to defend with better effect what is otherwise in the demands of Austria, Prussia, Baden, Savoy, &c. Now it *does* seem reasonable that those states should demand from the cantons not to convert themselves into casting houses and *fabrics* of insurrections and revolutions, and that they should keep in order the fire-brands and madmen they give asylum to. It may appear ridiculous enough to us that such great or considerable states should be kept in alarm by the presence or close neighbourhood of a few weak bands of refugees, without arms or money, or any *point d' appui*; but then it is in the very nature of their governments to be timid; and be it remembered, these refugees on the frontiers have not only been detected in exciting their friends (particularly in Piedmont) to rise, but have, on one occasion, made an open armed attack on the territory of Savoy, where they both lost and spilt blood.

Some of the cantons, we know, have already made prudent regulations on this head, and they are generally, we believe, disposed to do what is right; but Berne is now ruled by a new party, unaccustomed to the niceties of government, and enthusiastic for liberty in the abstract—and Birne is this year *Vorort* or President of the general Swiss diet. After all, we admire the spirit and hospitality of the honest republicans. They manage these things differently in France! For nearly a year past the French government has been in the habit of seizing such of the refugees as made disturbances on her frontiers or elsewhere, and sending them in charge of gens-d'armes to Calais, where they are forcibly embarked for Dover, "as if" says one of the Italian sufferers "England had become the Botany-Bay of Louis Philippe."

AUSTRIA.

The Emperor of Austria, whose health had long been declining, expired at Vienna, on the 1st of March, in the sixty-seventh year of his age. Francis Joseph Charles, commonly called Francis I., Emperor, King of Hungary and Bohemia, of Lombardy, Venice, &c., &c., &c., was born at Florence, on the 12th of February, 1768. He succeeded his father, the Emperor Leopold II., in the states of his house, on the 1st of March, 1792; was crowned King of Hungary on the 6th of June, elected "Roman Emperor" on the 7th, and crowned in that capacity on the 14th of July. On the 5th August of the same year (1792) he was crowned King of Bohemia. In 1804 he declared himself hereditary Emperor of Austria; and in 1806 he dropped the merely fictitious title of Emperor of Germany, &c. He had been four times married, and has left four children; all of whom were by his second wife, a princess of the Neopolitan Bourbon branch. His eldest son and successor, Ferdinand Charles Leopold Joseph Francis Marcellin (now the Emperor Ferdinand, &c.), was born on the 19th of April, 1793, and is now forty-two years old—a very good mature age to govern—if he had any talent, which has always been very much doubted.

So complete a control is exercised over all and every part of the German press, that the illnes of the Emperor was scarcely mentioned by the papers, and not a word escaped as to his "last scene of all"; but only, on a sudden, it was proclaimed that he was dead, "and there an end." His life had been sufficiently checkered. He began to reign in times of trouble and revolution, when a "fierce democracy made foot-balls of many crowns, and when the *prestige* of royalty generally began to wane and wax dim in Europe. He was soon engaged in long, most sanguinary, and most unfortunate wars. A man that seemed born for the ruin of his empire; beat army after army, heaped degradation on degradation, and twice marched as a conqueror to Vienna, where finally Francis was fain to obtain peace by marrying a daughter of his proud imperial line to the Corsican soldier of fortune, who, be it said, after that ill-augured union was never the man he had been. All these things are of notoriety, but the wonderful power of resistance in the empire and in the Emperor,—the faculty of standing an indefinable quantity of defeat and beating, and then of rising again, formidable in numbers, to renew the contest—the patience, the resignation, the passive force—the *vis inertiæ* of the Austrian empire, have hardly been sufficiently attended to. An expression of astonishment which Buonaparte made use of in the height of his prosperity, marks this in a strong manner. It was, "*Cette vieille maison d' Autriche ne meurt jamais!*" It lived to see him, the conqueror, die a prisoner at St. Helena.

A great deal of talk is now heard about the Emperor Francis's character and domestic virtues. The character of an absolute monarch, when he does not happen to be a fool, and wholly subservient to ministers and favourites, is best seen in the acts of his government; and those of Francis's cabinet speak for him to the world, proclaiming much that is good, much that is weak and absurd, and much that is foul and tyrannical. His private virtues were good to him and his family, and might have been profitable, as examples, to the people of Vienna, or other places where he passed his days, if they had been disposed to follow them (which they certainly were not); but what did they import to the many millions of his subjects—to the Hungarians, the Transylvanians, the Lombards, the Venetians—whose wealth and industry he checked, by his obstinate adhesion to an absolute but selfish system of administration and finance, and whose energies he destroyed, whenever he could, by increasing the weight of the yoke they bore?

And of what consolation was it to the Italian, and other state prisoners, loaded with chains, and rotting in the dungeons of Spielberg, to know that the Emperor was a man of mild, affable manners, exceedingly accessible to all classes, very good-natured when pleased, very much beloved by his Austrian-born subjects, moderate in his personal expenses, simple and unostentatious, religious without bigotry, and altogether so modest and good a monarch, that, in the words of one of his eulogists, many and many a time "he has been seen walking alone through the streets of Vienna, or with the Empress, or one of his daughters, under his arm, in the delightful promenades of Baden; always wearing a plain pepper-and-salt coloured coat, with white drab pantaloons, and long Hessian boots?"

To make a gloomy, ferocious, blood-drinking, melo-dramatic tyrant of such a man, as many attempted to do, was absurd. Francis was born and bred to the belief of the divine right of kings; and was firmly convinced all his life, that the monarchic and absolute form of government was the best, not only for *him*, but for his *people*. We really believe that, in the most cruel act he ever committed, in defence of these doctrines, he thought he was rendering a service both to God and man; and that, if even the groans of his numerous political prisoners could have pierced the dungeon walls, and travelled all the way to Vienna, making themselves heard at his bed-side, however much they might have disturbed his nerves, they would have given no disturbance to his conscience.

The mere word "constitution," whether employed in its figurative political sense, or merely to denote the state of the body, was hateful and horrible to his ears. We had the following anecdote from an undoubted source:—"One day his physician, in the course of a consultation on the state of the Emperor's health, instead of using the word of Teutonic origin, employed the Latin derivative (which, in German, as in English, has the double moral and physical meaning), and said, 'Your imperial Majesty's *constitution*.' The Emperor, always pale, became white with emotion, and moved from his seat, saying, 'Doctor! never again pronounce *that word* in my hearing!'"

The heir to the throne, even when of mature years, took little or no share in public business. This was attributed, by some, to Ferdinand's own indolence and incapacity; but other people said, it arose out of the jealousy of the Emperor and his Prime Minister. In all the Austrian dominions, as from one end of Europe to the other, it was believed the Archduke had an implacable hatred of Metternich; but the first act of his reign has been, to confirm that minister in power, and publicly to adopt the whole of his system. He wrote the following letter the day after his father's decease:—

"To PRINCE METTERNICH, &c. &c.

"Dear Prince Metternich,—I inclose you a copy of a letter, which I have just addressed to the Grand Marshal of the Court.

"Profoundly affected by the unfortunate event which has filled us all with sorrow, and overwhelmed myself in particular with the severest agony, I must for the present confine myself to acknowledging the services which you have rendered to my late exalted parent, to my family, and to the state; to the assuring you of my grace and favour; to calling upon you for a continuation of your services; and to commission you to announce to all those employed under you in the public service, either at home or abroad, without exception, that they are confirmed in their various places, offices, and dignities; and further, that in the full conviction of the conscientiousness and fidelity with which they will continue to discharge their duties according to the standing orders, I dispense with the solemn renewal of their oaths.

"In reference to the new title and armorial designs, you will make the necessary arrangements, or lay them before me; and you will also give the requisite instructions to the proper authorities in the various departments, as to the alterations in the seals of office and in the mintage.

"*Vienna, March* 2, 1835." "FERDINAND."

And is the usual act of grace, at the beginning of a new reign, not to be performed? Are the political prisoners still to wear their chains, and moan away their lives in unhealthy dungeons? From the liberation of the most feared or hated of the number, the Austrian government has nothing to fear. Count Frederic Gonfaloniere, once one of the most wealthy and accomplished noblemen of Italy, during twelve years of execrable captivity, has lost the use of his limbs; and, for more than six months out of the twelve, during several years, has been stretched in anguish on his straw, unable to move with rheumatic and other pains, produced by the place and nature of his confinement. This fact we have from one who was for years his companion in captivity.

CHRONICLE OF OCCURRENCES.

Feb. 28.—Earl Nelson, Duke of Bronti, brother of the celebrated naval hero, died this day. His lordship was in his 78th year. His remains were deposited on the 9th March, in St. Paul's, in a vault near his illustrious brother.

March 2.—The Emperor of Austria, Francis I., died this day at one o'clock in the morning, in his 67th year.

— A very destructive fire occurred at the west end of the Metropolis which, before it was got under, destroyed a number of houses and property, valued at upwards of 50,000*l.* in Marshall Street, Silver Street, and Broad Street, Golden Square. A subscription was subsequently set on foot for the relief of the sufferers, many of whom have lost all their property. No lives were lost.

3. The Gazette of this day announced the elevation of Sir Charles Manners Sutton, the late Speaker of the House of Commons, to the peerage, by the titles of Viscount Canterbury and Baron Botesford.

— At a meeting of the shareholders of the Thames Tunnel, held at the City of London Tavern, it was announced that Government had placed in the hands of the Directors a sum which the Engineer thought would be sufficient to complete the work. This sum was 247,000*l.* in Exchequer bills, advanced on the security of the property.

4. The new lecture theatre of the Marylebone Literary and Scientific Institution was opened this day, when a numerous body of its friends and supporters assembled—Lord Brougham in the chair. Various resolutions were proposed and passed; the following gentlemen taking part in the proceedings:—Basil Montague, Esq., Sir Anthony Carlisle, Dr. Sayer, Sir John Ross, Mr. Young, Mr. Buckingham, M.P., and the Rev. Mr Ramsay.

— A meeting was held at the British Coffee House, Cockspur Street, Westminster, for the purpose of considering the best means to be adopted for the repeal of the window tax. It was attended by two or three Members of Parliament, and a resolution was adopted to the effect, that letters be addressed to every city, borough and town throughout the empire, calling upon them to co-operate with the 'Central Committee of Westminster, in order to effect the repeal of the window tax.' Additional meetings have since taken place, in furtherance of the object. There have been also a few meetings in vestry of the rate-payers in several metropolitan parishes for the same purpose, but the attendance at all of them has been far from numerous.

— The fifty-second anniversary of the Benevolent Society of St. Patrick was celebrated at the Freemasons' Tavern, Great Queen Street; Lord Stanley in the chair. There were about 300 noblemen and gentlemen assembled. The total amount of the subscriptions during the evening was announced to be 1185*l.* 3*s.*

19, 20. Two different causes of bribery, arising out of the late contested election for Cambridge, have been tried before Lord Abinger. It being necessary that some private individual should appear as prosecutor, Professor Henslow consented to do so. The defendants in each case were interested for Mr. Knight, the Chancery barrister, the unsuccessful candidate. The juries returned verdicts for the full amount of the penalty under the 2nd. Geo. II., c. 24, viz., 500*l.*, in each instance. One of the defendants has also had a true bill returned against him by the Grand Jury, on a charge of attempting to bribe eight other voters. It is to be hoped that these convictions will have some effect in putting down a practice which has for many years been carried on to a large extent, almost without any apprehension of danger.

Intelligence from the Cape of Good Hope of various dates, from 25th December to 16th January, communicates a series of disastrous events that have befallen the thriving little colony occupying the country in the vicinity of Graham's Town, South Africa. They were caused by an invasion of the Caffres, who, in large bodies, fell upon the scattered settlers, murdering them, burning their houses, destroying their crops, and carrying away their cattle. One account ascribes the origin of the calamitous and murderous invasion of the Caffres to the circumstance of some horses having strayed beyond the Caffre frontier, followed by a young lieutenant with a party of patrol, who, not being able to find the strayed horses, seized a number of cattle belonging to the Caffres, and drove them off. Should this be the fact, the attack has not been unprovoked, although the original outrage has been fearfully avenged. It was feared, at one time, that Graham's Town would be destroyed, the number of the Caffres being far superior to the numbers the settlers could muster. According to the latest intelligence it was supposed that the Caffres would retreat before the force collecting against them; and the governor had left Cape Town on the 4th January, for Simon's Town, from whence he was to proceed to the frontier. The Caffre chief, Tyali, had sent in proposals for a cessation of hostilities, stating that he had been very unjustly treated by the colony; but as he had repaid himself for his losses, he had no objection to withdraw his forces, provided the country was vacated as far as the Great Fish River. A large division of the insurgents were reported to be at a place about eighteen miles north-west of Graham's Town, and Colonel Somerset had, consequently, proceeded in that direction with 100 mounted men and a field-piece. The advices from Graaf Reinet mentioned that the civil commissioner, with the Graaf Reinet Commando, had had an engagement with a party of Caffres on the banks of the Great Fish River, near Somerset, and had defeated them, with a loss on his part of three men. Every thing was doing on the part of the authorities to protect the lives and property of the colonists.

MUNICIPAL CORPORATIONS (ENGLAND AND WALES).

On the 18th of July, 1833, a commission was appointed under the Great Seal, authorising commissioners therein named "to proceed with the utmost dispatch to inquire as to the existing state of the municipal corporations of England and Wales." The Report of the Commissioners having been laid before the House of Commons, was ordered to be printed on the 30th of March last; and it is now before us, forming, with its Appendix, a volume of 132 pages. As this document, although in the highest degree interesting, is too long to be reprinted entire, we shall present as full an abstract of it as our limits will allow, making use, for the most part, of the words of the commissioners, and only omitting statements and remarks of subordinate importance. Our own observations we must reserve for a future Number.

The commissioners have satisfactory reasons for believing that there are 246 corporations in England and Wales possessing or exercising municipal functions. The number of places in which the inquiries under the commission were carried on was 237, having a population of 2,028,513. These corporations were classed, according to their local situation, into eleven districts. In twenty-five places the number of corporators was not ascertained; in the others (212) they amount to 88,509. The governing body is self-elected in 186 boroughs. This body elects the mayor in 131 boroughs, appoints the recorder in 136, and the town clerk in 135. The number of corporators exercising magisterial functions is 1086 in 188 boroughs. In 112 boroughs the corporation has exclusive criminal jurisdiction extending to the trial of various descriptions of offences; and in forty-two their jurisdiction is not exclusive. Seventeen boroughs do not enjoy any income whatever; in eight the precise amount cannot be obtained. The total income of 212 boroughs amounts to 366,948*l.* 17*s.*; their expenditure to 377,027*l.* 15*s.*: 103 are involved in debts amounting to 1,855,371*l.* 3*s.* 7*d.*, and are besides burdened with annuities amounting to 4463*l.* 1*s.* 3*d.*. In twenty-eight boroughs only are the accounts published; in fifteen the annual income is under 20*l.*; in eleven it is between 2000*l.* and 3000*l.*: in five, 3000*l.* and under 4000*l.*; in one, 4000*l.* and under 5000*l.*; in four, 5000*l.* and under 7500*l.*; in five, 10,000*l.* and under 12,500*l.*; in one, 12,500*l.* and under 15,000*l.*; in one, 15,000*l.* and under 20,000*l.*; in one, 43,000*l.*, and in one, 91,000*l.*

The commissioners proceeded to investigate the several matters within the scope of their commission, in each corporation, under the following heads of inquiry:—

1. The local limits of the corporation.
2. The charters by which it is constituted.
3. The title of the corporation, a copy of the governing charter, and the date of all other charters.
4. The several officers of the corporation, how, and by whom elected, or removed; the time for which they hold their respective offices; their respective functions and privileges, and their salaries and incidental emoluments.
5. The mode by which persons become free; their duties, privileges, and emoluments; the number of resident and non-resident freemen.
6. By whom and from whom the ruling body of the corporation is elected.
7. Fees paid on admission to the freedom or any office in the corporation, and to whom paid.
8. Courts, criminal and civil; the officers or magistrates presiding or otherwise acting in them; the extent of their jurisdiction, whether exclusive or otherwise; the nature of their process; what fees are paid in them, and to whom; and tables of costs.
9. The juries, grand and petty, criminal and civil; by whom, and from whom selected.
10. The management of the local police, and general regulation of the town.
11. The superintendence of the gaols; by whom exercised, and under what control.
12. Fines imposed by the corporation on their own members or others.
13. The nature of the property; the amount of receipts of the corporation, from whom derived, by whom received, to what purposes, and by whom applied; how, and to whom accounted for.
14. The patronage, ecclesiastical and other, exercised by the corporation, through whom dispensed.
15. A schedule of the dates and titles of the local acts of Parliament relating to municipal government, or local taxation.
16. The general state and prospects of the town.

The inquiry is completed, and all the reports are delivered except those on the boroughs of twenty-one corporate towns. A special Supplemental Report will be devoted to the municipal institutions of London.

With few exceptions, much readiness has been evinced by the corporate authorities to promote the objects of the inquiry. In some towns where the corporate body refused to assist in the investigation, the difficulty has been in a great measure removed by the testimony of inhabitants and others.

The following corporations absolutely refused all information:—Corfe Castle, Dover, Lichfield, Maidstone, New Romney, and several of the London companies.

The following assisted in parts of the inquiry, and refused to do so in other parts:—Arundel, Kingston-upon-Hull, Leicester, Rochester, and several of the London companies. The point principally objected to was an examination of the accounts, and an inquiry into the income and expenditure of the corporation.

The commissioners did not feel themselves authorised to institute any investigation into the titles to the property held or claimed by the several corporate bodies; nor did they inquire into the particular state of public charities and eleemosynary foundations in the corporate towns, of which the corporators were in whole or part administrators except so far as respected any misuse for corporate and municipal purposes, or in cases where the administration of the trust estates appeared to have been mixed up with that of the proper funds of the corporation.

Early Constitution.—On this point the commissioners have confined themselves in most instances to an enumeration of the charters in possession of the municipal authorities, or a brief summary of their contents.

It would be difficult to describe accurately the early constitution of the municipal corporations in England and Wales. It is certain that many of their institutions were

[Printed by WILLIAM CLOWES and SONS Stamford Street.]

established in practice long before they were settled by law. In some places, as at Newcastle-upon-Tyne, Carlisle, and Scarborough, the forms of the municipal government were defined by an express composition between the magistracy and the people. It is probable that the powers of government, in all ordinary cases, were exercised by the superior magistracy, but that in extraordinary emergencies the whole body of burgesses was called upon to sanction the measures which interested the community. The difficulty of conducting business in such an assembly seems to have suggested the expedient of appointing a species of committee out of the larger body, which acted in conjunction with the burgesses, and which was dissolved when the business was concluded. These committees afterwards became permanent.

In a period, of which the beginning cannot be distinctly shown to have been much earlier than the reign of Richard II., arose a new and very important feature of our municipal policy, namely, the annexation of the powers of 'justices of the peace and of labourers' to the municipal magistracy, with a considerable enlargement of their civil and criminal jurisdiction.

Another very important feature of the era between the reigns of Richard II. and Henry VI., is the introduction of a legal principle hitherto unknown; that is, of a municipal body politic and corporate which takes by succession, admitting members upon a mere personal right, without any qualification either of residence or of property.

The greater number of the governing charters of corporations was granted between the reign of Henry VIII. and the Revolution; the general characteristic of these documents is, that they were calculated to take away power from the community, and to render the governing class independent of the main body of the burgesses. Almost all the councils named in these charters are established on the principles of self-election. The criminal jurisdiction of the boroughs received still further enlargement; and numerous instances occur in which a recorder was created, which office had been before that time confined to some of the larger boroughs. There is little reason to doubt that the form given to the governing classes, as well as the limitation of the burgess-ship, during this period, was adopted for the purpose of influencing the choice, or nomination of members of Parliament. At this time the honorary office of High Steward was created in many boroughs, by which the borough became connected with the aristocracy or with the crown. Some of these charters contain clauses by which the right of electing members of the House of Commons is limited to the select bodies which they created.

During the reigns of Charles II. and James II., many corporate towns were induced to surrender their charters, and to accept new ones, containing clauses giving power to the crown to remove or nominate their principal officers. After the proclamation by James II., dated 17th October, 1688, the greater number of these towns returned to their former charters. The charters which have been granted since the Revolution are framed nearly on the model of those of the preceding era; they show a disregard of any settled or consistent plan for the improvement of municipal policy, corresponding with the progress of society. The charters of George III. do not differ in this respect from those granted in the worst period of the history of these boroughs. It has become customary not to rely on the municipal corporations for exercising the power incident to good municipal government. The powers granted by local acts of Parliament for various purposes, have been from time to time conferred, not upon the municipal officers, but upon trustees or commissioners, distinct from them; so that often the corporations have hardly any duties to perform. They have the nominal government of the town; but the efficient duties, and the responsibility, have been transferred to other hands.

Corporate Body.—The constitutions of the existing municipal corporations in England and Wales, are exceedingly various in detail. The constitution of a great number is, practically, much affected by the return of members of Parliament. The municipal powers of many are almost nominal: generally they consist of a number of freemen, having within themselves a governing body, besides magistrates and various officers.

There are very few charters which unequivocally designate the corporate body as a small and definite number of persons. In corporations in which, although there is no doubt, both from the wording of the charters, and from the modern practice, that the number of corporators may be indefinite, it has been the policy of the ruling body to restrict the number, so as to retain all the privileges constitutionally belonging to a large and indefinite body in the hands of a small and select one. The commissioners often found that the freemen had long ceased to consider themselves as forming any part of the corporation, which term, in popular language, was exclusively applied to the ruling body. In some places this notion has been further refined upon, and a distinction has been drawn in the large indefinite body of corporators, between those elected by the ruling body, and those claiming by an independent right; the former class only being treated as forming an integral part of the corporation.

In those boroughs where the number of corporators is definite, or where it has been always kept small, the principal mode of entering the corporation is by the nomination of the ruling body. In some cases the election must be from persons qualified, the most usual qualification being residence in the borough; in other cases the choice of the electors is unfettered by any conditions of eligibility in the persons chosen. In a few places the possession or occupation of property gives a title to the freedom. A distinction is now made everywhere between the freemen and the inhabitants, except in a very few places, as at Beccles and Wisbech. The right of conferring the freedom by sale or free gift is claimed and exercised by the ruling body of almost every corporation. Particular officers of the corporation, usually the mayor, are frequently allowed to name a certain number of persons to be admitted to the freedom.

It is necessary in London, Shrewsbury, and many other towns, in order to complete a title to admission to the municipal freedom, that the party applying should be first admitted a member of certain guilds or trading companies still existing within the borough, and preserving various degrees of connexion with, and subordination to the municipal corporation. There are traces of a more general prevalence of the same custom at an early period. Occasionally, as at Bristol and Evesham, an incorporated guild has continued to exist after its connexion with the municipal corporation has been almost or altogether dissolved.

The right to the freedom acquired by birth is very various in different places. In some, none but the children of freemen born within the borough acquire the right; in others, the children of freemen, wherever born. This enumeration might be extended still further.

The right to the freedom by marriage is acquired by marrying the daughter or widow of a freeman.

The third right, by servitude or apprenticeship, usually accrues by service under indentures of apprenticeship for seven years to a freeman within the borough.

In most corporations the right to the freedom, or citizenship, or burgess-ship, has been restricted to a much smaller class than that which formerly possessed it.

The functions of the freemen in most towns arise out of their share in the election of members of Parliament, and of their own corporate officers. They have retained the former right in many places in which they have been long deprived of the latter.

The share which the freemen at large now take in the election of their governing bodies and corporate officers, is in most places very limited. In a great majority of those towns in which there is a large body of freemen, they have no share whatever in those elections. In a few instances, such as Berwick-upon-Tweed, Ipswich, and Carmarthen, they have the right of electing, from among themselves, all, or nearly all, the corporate officers; in others, such as Beverley and Pontefract, they elect only the mayor; in Norwich they elect the aldermen, common councilmen, and one of the two sheriffs; in some, such as Plymouth, they have the right or electing their officers out of a select body; in others, as Oxford and Swansea, they have only the power of selection from the nominees of such a select body. In many places where the system of self-election now prevails, no trace exists of a more popular mode having been used at any time; in others, such as Newcastle-under-Lyme and Bridgenorth, the right clearly appears to have been taken away from the freemen by ancient usurpation of the select body; and in the case of Newcastle-under-Lyme, it has been recently restored, after an interval of two hundred years, by a decision of the Court of King's Bench. In some towns these rights are possessed only by the resident free-

men, in other places by all the freemen, whether resident or non-resident. The latter is the more common case.

The privileges of the freemen, besides their share in elections, generally consist in exemption from the tolls and duties which in many towns are levied under various grants from the crown. The freemen, in most towns, are exclusively eligible to corporate offices. The freemen are also very generally excused from serving on county juries; this exemption is often enjoyed by all the inhabitants of corporate towns. They have sometimes exclusive privileges in the local courts. They have, in many places, the exclusive right of trading within the corporate limits, as in Oxford, York, and Beverley. Another privilege, often belonging to the freemen is, that they or their widows or children are designated as the sole objects of local charities.

Governing Body.—The government of the existing municipal corporations in England and Wales is generally vested in a chief officer and a council, called the common council, over which he presides. In some boroughs the freemen are themselves the governing body, as at Ipswich, Carmarthen, and Berwick-upon-Tweed.

The body of the council is often composed of two classes; the most common distinctive name of the superior class being that of aldermen, while the others are simply called common councilmen. In a few towns there are more than two classes in the common council.

A legal officer, who is found in most corporations with the title of recorder, is occasionally constituted by charter a member of the common council. In some towns other officers also become by their office members of the common council.

There are very few instances in the corporations of indefinite number, in which, as at Berwick-upon-Tweed and Ipswich, the general body of the freemen have the power of choosing whomsoever they please of themselves as the head of the corporation. Sometimes he is chosen by the freemen from the aldermen, or from the members of the common council. In some boroughs he is chosen by the body at large from among two or more nominated by the select body. The most common case is, that he is elected either from the aldermen or common councilmen, by the court of aldermen or common council.* In London, and some other towns, he is elected by a popular assembly from the aldermen, subject in London to confirmation by the court of aldermen.

The members of the common council are elected in the great majority of instances by the common council, or by that division of it commonly comprised under the name of aldermen. In some cases they are nominated by the mayor. The election is generally for life. Residence is sometimes a necessary qualification: often it is little attended to. The aldermen generally fill up vacancies in their own body from the other division of the common council. in other cases this class consists of all who have passed the chair. The aldermen also are usually chosen into that class for life. London and Norwich afford instances, among others, of elections by large bodies of freemen. In both these cities, the aldermen are elected for life, and the common councilmen annually. In London, they all are elected by the freemen, who for a year have occupied houses of a certain value, and who pay local taxes to a certain amount. In Norwich, all are elected by the freemen, without any qualification of residence, property, or local taxation.

The charters generally empower the corporations or the governing bodies to make bye-laws for the good rule and government of the town, and in some instances to tax the inhabitants for municipal purposes: but in a great number of corporations the power is disused, and no bye-laws are made. Many corporations have the power of enforcing their bye-laws by fine and imprisonment, but these powers are very little exercised.

The common councils have many other important duties to perform, independently of their share in the government of the corporation. In scarcely any case do they legally receive any salary or emolument, either as members of the common council or magistrates.

Corporate Officers.—The chief officers in most corporations, besides the mayor and recorder, are a town-clerk, a coroner, and a chamberlain or treasurer. In those cities and towns which are counties there are also sheriffs. Besides these principal officers, there is a great variety of subordinate officers.

The mayor or head of the corporation, besides being the president of the common council, is the chief magistrate and executive officer of the corporation. He is the returning officer, except in those boroughs or cities which are counties. The mayor usually presides at the quarter sessions for the borough, and is often a judge of the court of record, where such a court exists. He is often coroner *ex officio*. He is generally clerk of the markets, and sometimes keeper of the gaol: he is occasionally treasurer of the corporation. In a few ports, as at Rochester, he is the admiral, to the exclusion of the Admiralty of England; in others, as at Southampton, he has by charter a concurrent jurisdiction of that nature. He is often conservator of the rivers and waters adjoining the city or borough of which he is mayor.

In numerous instances, the appointment of the inferior officers of the corporation rests chiefly or entirely with the mayor, and in many small places he practically unites in his person almost all the authority of the whole body.

In most corporations a power exists of fining those who refuse to serve the corporate offices to which they are elected. At Leeds, the whole revenue of the corporation has accrued from this source. At Andover, a power is exercised of compelling the inhabitants at large to fill the inferior municipal offices, though they are now considered to form no part of the corporation.

Magistrates.—In almost all the principal boroughs there are municipal magistrates whose authority as justices of the peace extends over the whole borough. They are often chosen by the common council, and almost always are members of it: where there are aldermen, they are usually taken from that class. The mayor is always the chief magistrate within the borough, when the borough justices are named in the charter: in a few cases, as at Lancaster, Preston and Liverpool, he is also *ex officio* a magistrate of the county. The recorder is in most cases one of the justices. When the mayor is a magistrate, most of the magisterial business falls on him: in many corporations his magisterial authority continues for a year, or a longer time, beyond the period of his mayoralty, either by the express words of the charter, or by a customary election.

In many of the large cities and boroughs, all the aldermen are magistrates, in others only those are so who have passed the chair, as in Liverpool, Norwich and Lynn: in Norwich, the aldermen who have not passed the chair are magistrates in their own wards. In other towns, as Portsmouth, a certain number of aldermen only are annually elected to that office, which ceases with the year, unless they are re-elected. In Doncaster three aldermen are chosen to be magistrates as long as they continue aldermen. In many towns, as Carlisle and Kendal, the senior aldermen only are magistrates. In Ripon, the two aldermen who were last mayors are magistrates; in Richmond, the last mayor only is so constituted.

Criminal Courts.—The majority of corporations in England and Wales exercise a criminal jurisdiction within the limits of the borough. Many send all serious cases to the county sessions or assizes. Several corporations, as Berwick-upon-Tweed, Bristol, Canterbury, Exeter, Rochester, still exercise their chartered privilege of trying and executing criminals for capital offences.

The ordinary criminal courts are those of gaol delivery, and of general and quarter sessions. Where no commission issues, the corporate magistrates are the sole judges.

The juries are generally summoned from the inhabitants at large without strict reference to any qualification; sometimes from the freemen alone. In the latter case, the number out of whom they are chosen is often inconveniently small. At Pontefract the petty jury is always chosen from the freemen, the whole number being only twenty-six. The members of the ruling body sometimes claim an exemption from serving on any of the borough juries; in other cases the grand jury is summoned exclusively from them. In Lincoln none are qualified to serve on the grand jury but those who have served the office of chamberlain, the nomination to which is in the mayor. At Scarborough freemen never serve on the borough juries. In corporate boroughs the lists are commonly struck in the office of the town-clerk. In some towns, as Liverpool, one of the judges of the court has the power of striking the jury; the mayor in several towns, as at Bristol, nominates the foreman of the grand jury, and very frequently settles the whole list after it comes from the town-clerk's office.

Civil Courts.—In a large majority of the boroughs in England and Wales, there are local civil courts with a jurisdiction co-extensive with the limits of the borough. These

in general have their origin in particular charters, but occasionally they exist by prescription. In some, actions real, personal and mixed may be brought, and in general they have cognizance of all personal actions. In practice, suits for any other cause of action than debts are seldom instituted in these courts, unless in some of the larger boroughs, where the ordinary kinds of actions which occur at assizes are tried.

The borough courts seldom possess any printed or written rules, regulating their proceedings, and their practice, therefore, is very ill defined.

The presiding officer in these courts is generally the mayor, and hence they are not unfrequently termed the mayor's court. Sometimes the bailiffs preside with the mayor, in other instances the recorder, and occasionally some of the aldermen are judges. In other cases, the recorder, though a magistrate of the borough, is not a judge of the court of record. The town-clerk in many boroughs practically officiates as judge. The town-clerk usually performs all the duties of the court, except those which belong to the office of sheriff. He issues the writs, files and enrolls the proceedings, grants rules, taxes the costs, and signs the judgments.

It is only in the civil courts of the larger boroughs that the attendance of a jury is frequently required. In other places the suit seldom proceeds to issue, but is generally settled in its early stages. Frequently, not more than two or three actions are brought to trial in the course of a year, although more than a hundred writs may have been sued out. The juries summoned to sit on the trial of civil causes are almost invariably chosen in the same manner as the juries in criminal cases.

Gaols.- In nearly all the boroughs possessing criminal jurisdiction, there are gaols under the superintendence of the corporation or municipal magistrates. Debtors, taken under process from the Court of Record of the borough, must remain in the borough gaol.

Management of Poor.—The management of the poor in some towns is vested in the corporation. At Hull the recorder and members of the common council are exempted from being chosen members of the corporation of guardians of the poor.

Extent of Local Jurisdiction.—The boundaries of the jurisdiction exercised by the several municipal corporations in England and Wales are generally known with tolerable accuracy. In some cases, as at Grantham and Brecon, the corporate boundary is not continuous, but includes outlying parcels of ground. In most important towns the suburbs have extended themselves far beyond the limits of the corporate authority. The population of the city and county of Bristol is 59,000: the suburbs beyond the city contain an additional population of 45,000. The population of the city of Rochester is only 9891; the district immediately adjoining it, including the town of Chatham, comprises nearly 22,000 persons. The city of Carlisle contains 8356 persons; the suburbs are of as great extent, and contain a population of 10,713. At Hull, the municipal borough contains 15,996; the county of the town, including the borough, 32,958; the suburbs, which are beyond the jurisdiction of the borough magistrates, contain 20,000 more.

Frequently there are precincts locally situated within the limits of the corporate authority, but exempted from its jurisdiction. In the city of Canterbury there are not less than fifteen such precincts, though some are in dispute between the counties of Kent and Canterbury.

Property.—Many of the corporations have considerable revenues derived from various sources; from lands, leases of tithes, and other property; from tolls of markets and fairs; from duties or tolls imposed on the import or export of goods and merchandize, usually called town dues; from other duties, as from quay-dues, anchorage, &c.; and from fees payable on the admission of officers and burgesses, as well as from fines imposed on persons refusing to perform the duties of corporate offices.

In many of the corporations the revenues are sufficient for the maintenance of all necessary municipal institutions. In many, though amply sufficient for supporting the various purposes for which municipalities were instituted, they are not partially applied to them. In most, however, the revenues would be inadequate to these purposes, though they should be entirely expended upon them.

Extensive commons often belong to the freemen of corporate towns, the benefits of which are shared by them in various modes.

Some corporations hold their estates charged with the duty of repairing bridges and other works in their neighbourhood. Others have the control of funds appropriated to specific objects connected with the welfare of the town. In numerous cases, they are the trustees of property vested in them for charitable purposes.

The revenues of the corporations are variously employed: a great part is usually absorbed in the salaries of their officers, and entertainments of the common council and their friends. The costs of prosecutions at the borough sessions, and of supporting the gaols, form part of the expenditure in some places. It is not often that much of the corporate property is expended on police or public improvements.

The debt of many corporations is extremely heavy. In some, the payment of the interest absorbs a very large proportion of the revenue; others are absolutely insolvent.

The facts with respect to the amount and management of the corporate property, the expenditure and the debts, have been in many places elicited with difficulty, and only imperfectly, owing to the irregular manner in which the accounts have been kept. In some places no accounts are kept, in others they are kept in a very imperfect manner; in very few is there any regular and efficient audit, and in still fewer any publication, of the accounts.

Patronage.—The corporations frequently possess patronage, both ecclesiastical and lay. They present to livings, appoint lecturers, masters of schools and hospitals, and have the power of selecting the objects of various charities. This patronage is sometimes exercised by the governing bodies, sometimes by particular officers.

Having thus given a general view of the ordinary constitution of the municipal corporations in England and Wales, the commissioners proceed to certify the defects they have found in their constitution.

Corporate Body.—The most common and most striking defect in the constitution of the municipal corporations of England and Wales is, that the corporate bodies exist independently of the communities among which they are found. The corporations look upon themselves, and are considered by the inhabitants, as separate and exclusive bodies; they have powers and privileges within the towns and cities from which they are named, but in most places all identity of interest between the corporation and the inhabitants has disappeared. This is the case even where the corporation includes a large body of inhabitant freemen: it appears in a more striking degree as the powers of the corporation have been restricted to smaller numbers of the resident population, and still more glaringly when the local privileges have been conferred on non-resident freemen, to the exclusion of the inhabitants to whom they rightfully ought to belong.

Some corporations are occasionally spoken of as exercising their privileges through a popular body, but in the widest sense in which the term popular body is used in regard to corporate towns, it designates only the whole body of freemen; and in most towns the freemen are a small number, compared with the respectable inhabitants interested in their municipal government, and possessing every qualification, except a legal one, to take a part in it. In Plymouth, where the population, including Devonport, is more than 75,000, the number of freemen is only 437, and 145 of these are non-resident. In Norwich, the great majority of the inhabitant householders and rate-payers are excluded from the corporate body; while paupers, lodgers, and others, paying neither rates nor taxes, are admitted to the exercise of the functions of freemen, and form a considerable portion of the corporation.

In Ipswich, containing more than 20,000 inhabitants, the resident freemen form about 1-55th part of the population. Of these, more than 1-3rd are not rated; and of those who are rated, many are excused the payment of their rates. About 1-9th of the whole are paupers. More than 11-12ths of all the property assessed in this borough belong to those who are excluded from the corporation. All the inhabitants whose rent exceeds 4*l.* per annum, are taxed under a local act for municipal purposes. Of those who are so taxed, less than 1-15th are freemen. The assessed taxes paid in the borough exceed 5000*l.* per annum. The amount paid by all the corporate body is less than 1-20th of the whole. The condition of these freemen exposes them to bribery and undue influence, and advantage is taken of that condition to establish the most demoralizing practices.

In sixteen corporate towns, the population of the muni-

cipal borough is 659,431; of the parliamentary borough of the same town, 715,702; and the number of freemen is only 34,697.

A great number of corporations have been preserved solely as political engines, and the towns to which they belong derive no benefit, but often much injury, from their existence. To maintain the political ascendency of a party, or the political influence of a family, has been the one end and object for which the powers entrusted to a numerous class of these bodies have been exercised. This object has been systematically pursued in the admission of freemen, resident or non-resident; in the selection of municipal functionaries for the council and the magistracy; in the appointment of subordinate officers and the local police; in the administration of charities entrusted to the municipal authorities; in the expenditure of the corporate revenues, and in the management of the corporate property. The commissioners have generally found that those corporations which have not possessed the parliamentary franchise have most faithfully discharged the duties of town government, and have acquired, more than others, the confidence and good-will of the communities to which they belong. This has been the case in some, even where the ruling bodies are strictly self-elected.

Admission into the corporate body has commonly been sought mainly with a view to the lucrative exercise of the elective franchise. In those towns where a large body of freemen return Members of Parliament, the years in which elections have happened, or immediately preceding those in which they have been expected, are distinguished by the admission of a number greatly exceeding the average. The following table, taken from a Parliamentary Return, ordered to be printed 3d February 1832, shows the annual number of freemen admitted in 128 cities and towns from 1800 to 1831. London and Preston are the only towns omitted. A general election took place in the following years:—1802, 1806, 1807, 1812, 1818, 1820, 1826, 1830, and 1831.

Year	Freemen	Year	Freemen	Year.	Freemen	Year	Freemen
1800	1,775	1808	1,256	1816	2,582	1824	2,237
1801	2,051	1809	1,270	1817	1,715	1825	2,655
1802	5,782	1810	1,606	1818	8,889	1826	10,797
1803	1,397	1811	1,441	1819	1,430	1827	1,337
1804	1,254	1812	5,918	1820	4,695	1828	1,404
1805	1,473	1813	3,285	1821	1,468	1829	1,133
1806	4,700	1814	1,357	1822	1,430	1830	9,321
1807	3,114	1815	1,180	1823	2,080	1831	2,569

The election to municipal offices is often a trial of strength between political parties. Thus the inhabitants have to complain, not only that the election of their magistrates and other municipal functionaries is made by an inferior class of themselves, or by persons unconnected with the town, but also, of the disgraceful practices by which the magisterial office is frequently obtained: while those, who by character, residence, and property, are best qualified to direct and control its municipal affairs, are excluded from any share in the elections or management.

Governing Body.—The exclusive and party spirit which belongs to the whole corporate body, appears in a still more marked manner in the councils by which, in most cases, it is governed. They are commonly of one political party, and their proceedings are mainly directed to secure and perpetuate the ascendency of the party to which they belong. Individuals of adverse political opinions are, in most cases, systematically excluded from the governing body. These councils, which embody the opinions of a single party, are entrusted with the nomination of magistrates, of the civil and criminal judges, often of the superintendents of police, and are, or ought to be, the leaders in every measure that concerns the interest and prosperity of the town. So far from being the representatives either of the population or of the property of the town, they do not represent even the privileged class of freemen; and being elected for life, their proceedings are unchecked by any feeling of responsibility. The discharge of the functions with which they are entrusted is rendered difficult by the dislike and suspicion which the manner of their election evidently entails upon them.

To this system may be traced the carelessness often observed in the execution of their duties. The common council of the city of London presents a striking exception to the system of self-election for life, and it affords a remarkable instance of the absence of those evils which we refer to it. The common councilmen of this city are annually elected by a numerous constituency, yet changes seldom happen among them; experience in the functionary, and the power of control in the electors, being effectually united.

It is part of the general system of close corporations that all their affairs should be managed with the strictest secrecy, sometimes secured by oaths administered to the members of the common council. The inhabitants who are subject to the authority of the corporation have frequently very imperfect information as to its nature and extent; they are ignorant whether it derives its sanction from prescription, from charters, or from bye-laws; and the only mode by which they can obtain information is often through the troublesome and expensive process of an application for a *mandamus* or *quo warranto*. The bye-laws which are made, as well as those which are repealed, are seldom published, and the public is generally unacquainted with their provisions, except from common rumour. This ignorance is sometimes shared by the members of the corporation. Hence violations of the charters and bye-laws have been often made with impunity.

Corporate Officers.—The commissioners consider the union of the functions of a magistrate with the other duties of the mayor or other head of the municipal council, one of questionable expediency. Other functions, often united with the office of mayor, might be advantageously separated from it. Inconvenience of an opposite kind occurs, where several persons are required to concur in executing the duties of a single office.

In some cases the duties of the mayor have been totally neglected, either from want of capacity or from want of will; occasionally from non-residence. The effect of entrusting the election to the freemen, constituted as those freemen now generally are, is to degrade the office in the estimation of the persons to be governed.

The method of appointing the recorder is often very objectionable. This officer also unites functions, in some cases, which are improperly joined. This occurs, when he lives in the neighbourhood, and discharges the duties of a resident magistrate, at the same time that he is, by virtue of his office, the presiding judge of the criminal court. In many instances he performs no duties whatever, and his nominal connexion with the borough is only a form through which he exercises over it an unwarrantable control.

The practice of appointing a deputy permanently to discharge all the duties of the recorder is very mischievous. Not only is the appointment placed in the hands of an irresponsible individual, but the difficulty of finding qualified persons to fill the situation is increased.

The fact that, in numerous instances, persons not professionally educated are chosen recorders, deserves the most serious attention. In some towns, barristers are appointed recorders who wholly neglect to attend the borough sessions: flagrant instances occur at Lancaster and Carmarthen. The recorder of Carmarthen has held the office during fifty years, and has scarcely ever visited the borough, or performed any of the duties of the office, during that time. The recorder of Lancaster did not attend the quarter-sessions once between 1810 and 1832.

The extent to which some corporations have carried the principle of treating the corporate offices as a matter of mere patronage, may be illustrated by two instances, in which that principle has been applied to the very important office of town-clerk. At Winchester, upon a canvas for that office between two competitors, one only of whom was a member of the corporation, a compromise was effected, at the suggestion of some members of the governing body, by an arrangement that the two candidates should nominally hold the office jointly—that the one who was not a member of the corporation should manage the business—and that the emoluments should be divided. At Boston, on a vacancy of the office of town-clerk, an alderman and justice of the peace for the borough, with two of his brothers, who were also aldermen, supported a candidate on condition of receiving a yearly allowance out of the profits of the office. The candidate was elected, and the stipulated sum has been regularly paid. Several other members of the council were acquainted with this arrangement, and ratified it by the appointment.

Criminal Jurisdiction.—The criminal jurisdiction of the municipal corporations is extremely defective. The extent

of it is totally disproportioned to the importance of the town, or to the probable intelligence and respectability of its magistrates. In Bath, with a population exceeding 50,000, in the city and suburbs, no felonies can be tried, but all must be sent to a distance, varying from 18 to 50 miles. In Winchelsea, with a population of 772, and in Dunwich, with a population of only 232, the jurisdiction extends to capital felonies.

The party spirit which pervades the municipal councils, extends itself to the magistracy, which is appointed by those bodies, and from their members. The magistrates are usually chosen from the aldermen, and the aldermen are generally political partizans. Hence, even in those cases in which injustice is not absolutely committed, a strong suspicion of it is excited, and the local tribunals cease to inspire respect. The corporate magistrates, generally speaking, are not looked upon by the inhabitants with favour or respect, and are often regarded with positive distrust and dislike.

The corporate magistrates are often selected from a class incompetent to the discharge of judicial functions, and the consequence has been a great defect in the administration of justice. At East Retford, a respectable witness, who had been clerk to the magistrates, declared that one of the magistrates was in the habit of conversing familiarly with the culprits brought before him, and endeavoured to impress them with the idea that he was performing an unwilling office. On one occasion he saw the magistrate fighting with a prisoner, and struggling with him on the floor. At Malmesbury, the magistrates are often unable to write or read. At Wenlock, blank warrants have been signed by the magistrates: in one case a blank warrant of commitment was granted by mistake, instead of one of apprehension, and the constable had it in his possession for several weeks before he executed it. The jurisdiction of the borough magistrates at Wenlock is exclusive: it extends over 17 parishes, and contains a population exceeding 17,000 persons.

Even when the corporate magistrates belong to a superior class, they are often selected from the senior aldermen only, who, from age and infirmities, soon become incapable of performing the functions of their office, while a mistaken notion of dignity keeps them from resigning it.

A circumstance much complained of in many places, is the non-residence of the magistrates.

The evils resulting from the ignorance and inefficiency of the borough magistrates, are heightened by gross defects in other parts of the judicial system. The juries of the borough courts are often exclusively taken from the freemen, who, besides being composed of an inferior class, are strongly tainted with party feelings. Northampton furnishes a strong instance of this. At Carmarthen, verdicts are frequently given against justice, from party bias. The population of that town is 10,000, but the jurors are chosen from a small body of 178 burgesses. At the spring assizes of 1833, a true bill was found by the grand jury of the borough for a capital felony. The grand jury consisted of 20 burgesses; of these, 17 belonged to the corporation party, and the foreman was the committing magistrate. The panel of the petty jury contained 16 persons belonging to the corporation party, 12 of the defendant's party, and only two neutrals. An application was made to the judge, to order the indictment to be tried in Carmarthenshire. The trial took place there, and the defendants were acquitted. At Haverford West, the general opinion is, that it is 'impossible to convict a burgess.'

The most incompatible offices are often united in the person of the town-clerk. He very frequently acts as deputy-recorder; which practice, in our opinion, cannot be too strongly condemned. He is often, practically, the principal attorney for the prosecution of offenders tried at the borough sessions, whose commitment he had previously advised in his character of clerk to the magistrates. Even when his name does not appear to the prosecution, the same evil often ensues from its being in the hands of his partner. In York and Hull, great complaints have been made of the conduct of prosecutions by the town-clerk's partner, and in the latter place of the advantages which the rules of practice give him over other attornies. In Preston, the town-clerk is a member of the council, and his partner is the senior alderman, a magistrate, and a coroner. A strange incongruity sometimes appears in the election of the town-clerk to the office of mayor; in some places where this has occurred, an attempt has been made to gloss over the irregularity, by appointing another town-clerk during the year of his mayoralty. Whilst the same officer thus unites the characters of judge and prosecutor, the selection of the juries is often entirely committed to his discretion, and it cannot be a matter of surprise that suspicions of unfairness and partiality should be excited.

Civil Jurisdiction.—The same union of incompatible functions is found in these courts as in the courts of criminal jurisdiction.

If the recorder does not attend, the town-clerk becomes the real judge of the court, from the incompetence of the other magistrates to perform their duty.

At Reading, the town-clerk, during his mayoralty, tried and taxed the costs of a cause in which his partner was one of the attornies. In many towns, although he does not practise in the court of record as an attorney in his own name, he is the real attorney in the cause. At Kendal, the town-clerk's partner, who is an alderman, practises in the civil court. The same thing occurs at Scarborough, where the town-clerk acts as assessor in the civil court, and also taxes the costs.

The town-clerk often selects the juries in these as well as in the criminal courts, and they are often chosen from the same objectionable class.

The serjeants-at-mace and other ministerial officers of the court, who are placed in the situation of sheriffs, are often persons whose pecuniary responsibility is insufficient to afford any security to the suitors.

The costs of a suit in these courts, are, in general, very considerable, taking into account the fact that the expense of witnesses, which elsewhere is one of the heaviest charges in a suit, is here invariably light. The whole system of fees and costs in these courts is objectionable. There is, generally, no authorized table of them, and frequently no well-defined practice on the subject. They are mostly in the discretion of the town-clerk, though they are in some places taxed by the mayor.

Among other causes which have led to the disuse of these courts, may be accounted the want of professional skill in the judges. Nor can it be doubted that the intimacy which must necessarily exist between the judge and the parties who appear before him, has been one source of the disinclination to resort to these tribunals. A few minutes convert the tradesman and the customer into the judge and the suitor. Another prominent cause of the desertion of these courts has been the facility of removing the causes, and the general inclination on the part of legal practitioners to sue in the superior courts. The plaintiff, on procuring execution, can avail himself of it only within the limits of the local jurisdiction. His process therefore is frequently fruitless, the defendant removing himself and his goods beyond the limits of the court. This was a very common subject of complaint. These courts possess an unlimited power of imprisonment, which, in some cases, is made the means of great oppression.

Notwithstanding their defects, a very general desire was expressed on the part of the inhabitants of those boroughs where the civil courts had fallen into disuse, for their revival; and any system, which would have the effect of distributing justice where the parties interested reside, would be regarded as one of the greatest boons which the Legislature could confer.

Many of the evils we have enumerated as prevailing in the administration of criminal and civil justice, result from the continuance of jurisdiction after the decay of the borough. Even in the more important boroughs, great injustice results from entrusting the powers of sitting as magistrates in quarter sessions, and as judges of civil procedure, to persons not having professional knowledge and experience.

Gaols.—In the state of the borough gaols, we find additional proofs of the evils of continuing the present constitution of the local tribunals. Instances rarely occur in which the borough gaols admit of any proper classification of the prisoners. The prisoners are often without a proper supply of air and light: frequently the gaols are mere dungeons under the town-hall. In such receptacles it is impossible to put a prisoner to work, or to separate the criminals and the debtors.

It was frequently stated that the gaol of the borough was in so unfit a state for the reception of prisoners, that plaintiffs were unwilling to consign the defendants, against

whom they had procured execution, to confinement within its walls. At Saltash, it was said that the same feeling prevented the prosecution of criminals.

Police.—The police belonging to municipal corporations is for the most part very insufficient, and for supplying the deficiency resort is had to local acts. The superintendence of the police, and the powers necessary for watching, paving, lighting, cleaning, and supplying the towns with water, instead of being entrusted to the municipal authorities, are for the most part committed by these acts to various independent bodies, although none of these towns are too extensive to be embraced by one system of municipal government: for instance, every quarter of the town of Bath is under the care of a separate board, except one, which is totally unprotected. Much confusion results from this divided authority. The powers of local taxation, and the superintendence of matters so closely connected with the comfort and well-being of the inhabitants, which are now exercised by these bodies, appear to belong precisely to that class of objects for which corporate authority was originally conferred: but great dissatisfaction would prevail among the inhabitants, if these powers were entrusted to the municipal corporations as at present constituted. In several towns much apathy is now shown by the inhabitants with respect to the municipal benefits conferred by these acts. In Southampton, where the consent of the inhabitants is required to bring them within the powers of a local act, nearly half of the town has refused the benefit of it. Great jealousy often exists between the officers of police acting under the corporation, and those under the commissioners of these local acts: and the corporate body seldom takes any active share in the duties of the board, of which its members form a part. At Bristol, a notoriously ineffective police cannot be improved, chiefly in consequence of the jealousy with which the corporation is regarded by the inhabitants. At Hull, in consequence of the disunion between the governing body and the inhabitants, chiefly arising out of a dispute about the tolls and duties, only seven persons attended to suppress a riot, out of 1000 who had been sworn in as special constables, and on another similar occasion none attended. At Coventry, serious riots and disturbances frequently occur, and the officers of police, being usually selected from one political party, are often active in fomenting them. In some instances, the separate and conflicting authority of the commissioners is avowedly used as a check and counterbalance to the political influence of the corporation. At Leeds, no persons are elected commissioners of police whose political principles are not opposed to those of the corporation.

Extent of Local Jurisdiction.—The frequent occurrence of precincts, in the heart of the corporate towns, not subject to the authority of their magistrates, has been mentioned. Such places, by protecting offenders against the law, still present the same obstacles to an effective police, which were once found in sanctuaries.

Property.—The exemption from tolls or dues payable on the exportation or importation of goods in some of the great commercial towns constitutes the most valuable privilege of the free merchants, and is at the same time strongly complained of by the merchants who are not freemen. In Liverpool, one mercantile firm has paid to the town dues more than 1100*l.* in one year. Whatever may have been the origin of the tolls, in many cases they are now paid without any equivalent consideration being rendered by the corporations which enforce them.

By some corporations a revenue has been occasionally derived from very improper sources. The corporation of Tiverton had for many years an allowance from the receivers-general of the county of Devon, which allowance was stipulated for by the corporation, as a consideration for the exercise of their influence with one of the capital burgesses in obtaining the appointment.

The evils which have resulted from mismanagement of the corporate property are manifold, and of the most glaring kind. Some corporations have been in the habit of letting their lands by private contract to members of their own body, upon a rent and at fines wholly disproportionate to their value, and frequently for long terms of years. Others have alienated in fee much of their property for inadequate considerations. At Cambridge, practices of this kind have prevailed to a very great extent. In large towns, the most striking defects are carelessness and extravagance in the administration of the municipal funds, and an exclusive distribution of patronage among friends and partisans.

In some towns large sums have been spent in bribery and the other illegal practices of contested elections. During the election of 1826, the corporation of Leicester expended 10,000*l.* to secure the success of a political partisan, and mortgaged some of their property to discharge the liabilities incurred. In Barnstaple and Liverpool the funds of the corporation have been wasted in defending from threatened disfranchisement a body of freemen who had been proved guilty of bribery.

In general, the corporate funds are but partially applied to municipal purposes, such as the preservation of the peace by an efficient police, or in watching or lighting the town, &c.; but they are frequently expended in feasting, and in paying the salaries of unimportant officers. In some cases, in which the funds are expended on public purposes, an expense has been incurred much beyond what would be necessary, in consequence of the plan of avoiding public contract, and of proceeding without adequate estimates. These abuses often originate in the negligence of the corporate bodies, but more frequently in the opportunity afforded to them of obliging members of their own body, or the friends and relations of such members.

Few corporations admit any positive obligation to expend the surplus of their income for objects of public advantage. Such expenditure is regarded as a spontaneous act of private generosity, rather than a well-considered application of the public revenue; and the credit to which the corporation, in such a case, generally considers itself entitled, is not that of judicious administrators, but of liberal benefactors. Even in these cases, party and sectarian purposes often prevail in its application.

From this erroneous but strongly-rooted opinion, that the property of the corporations is held in trust for the benefit of the corporate body only, distinguishing that body from the community with which it is locally connected, the transition is not difficult to the opinion that individual corporators may justifiably derive a personal benefit from that property. At Cambridge, the practice of turning the corporation property to the profit of individuals was avowed and defended by a member of the council.

This principle has been undisguisedly adopted in few corporations compared with the number of those in which it is indirectly acted upon. Some sense of impropriety, indicated by the secrecy with which such transactions are conducted, has accompanied the execution of long leases for nominal considerations, or the alienations in fee of the corporate property to individual corporators. Advantages of a different kind are offered in the shape of salaries to sinecure, unnecessary, or overpaid officers.

The salaries to the corporate officers, in a great many instances, are not at all commensurate with their duties. The allowance to the chief officer is often very large, and it is well understood that he is to expend it in public entertainments. In some places, a considerable part of the revenues of the corporation appears to have been devoted to such purposes. An opinion was obviously entertained at many places, that any degree of expenditure for such purposes might be justified, if the corporation restrained itself within the limits of its permanent income, and did not tax the inhabitants to supply the means of such expenditure.

With the custom of conferring salaries that must be considered exorbitant, even when the officers chosen are competent to the proper discharge of their duties, may be classed the practice of bestowing important and high-salaried situations upon incompetent persons: both are among the many evils arising out of the system of self-election and irresponsible exercise of patronage.

Conduct of this description would probably have been checked by the mere force of public opinion, if the corporate accounts had been subjected to the scrutiny which must have resulted from the publication of them.

The debts incurred by many corporations, have been swelled to their present amount, by most negligent and improper management. At Berwick-upon-Tweed, where the freemen manage the affairs of the corporation, and possess commons of the value of about 6000*l.* per annum, they have borrowed money expressly for the purpose of dividing it amongst themselves.

Many of the close corporations have become indebted to the patron of the borough for sums of money advanced to them for municipal and other purposes.

Specific Trusts and Patronage.—Various funds and revenues have been entrusted to corporations for specific ob-

of it is totally disproportioned to the importance of the town, or to the probable intelligence and respectability of its magistrates. In Bath, with a population exceeding 50,000, in the city and suburbs, no felonies can be tried, but all must be sent to a distance, varying from 18 to 50 miles. In Winchelsea, with a population of 772, and in Dunwich, with a population of only 232, the jurisdiction extends to capital felonies.

The party spirit which pervades the municipal councils, extends itself to the magistracy, which is appointed by those bodies, and from their members. The magistrates are usually chosen from the aldermen, and the aldermen are generally political partizans. Hence, even in those cases in which injustice is not absolutely committed, a strong suspicion of it is excited, and the local tribunals cease to inspire respect. The corporate magistrates, generally speaking, are not looked upon by the inhabitants with favour or respect, and are often regarded with positive distrust and dislike.

The corporate magistrates are often selected from a class incompetent to the discharge of judicial functions, and the consequence has been a great defect in the administration of justice. At East Retford, a respectable witness, who had been clerk to the magistrates, declared that one of the magistrates was in the habit of conversing familiarly with the culprits brought before him, and endeavoured to impress them with the idea that he was performing an unwilling office. On one occasion he saw the magistrate fighting with a prisoner, and struggling with him on the floor. At Malmesbury, the magistrates are often unable to write or read. At Wenlock, blank warrants have been signed by the magistrates: in one case a blank warrant of commitment was granted by mistake, instead of one of apprehension, and the constable had it in his possession for several weeks before he executed it. The jurisdiction of the borough magistrates at Wenlock is exclusive; it extends over 17 parishes, and contains a population exceeding 17,000 persons.

Even when the corporate magistrates belong to a superior class, they are often selected from the senior aldermen only, who, from age and infirmities, soon become incapable of performing the functions of their office, while a mistaken notion of dignity keeps them from resigning it.

A circumstance much complained of in many places, is the non-residence of the magistrates.

The evils resulting from the ignorance and inefficiency of the borough magistrates, are heightened by gross defects in other parts of the judicial system. The juries of the borough courts are often exclusively taken from the freemen, who, besides being composed of an inferior class, are strongly tainted with party feelings. Northampton furnishes a strong instance of this. At Carmarthen, verdicts are frequently given against justice, from party bias. The population of that town is 10,000, but the jurors are chosen from a small body of 178 burgesses. At the spring assizes of 1833, a true bill was found by the grand jury of the borough for a capital felony. The grand jury consisted of 20 burgesses; of these, 17 belonged to the corporation party, and the foreman was the committing magistrate. The panel of the petty jury contained 46 persons belonging to the corporation party, 12 of the defendant's party, and only two neutrals. An application was made to the judge, to order the indictment to be tried in Carmarthenshire. The trial took place there, and the defendants were acquitted. At Haverford West, the general opinion is, that it is 'impossible to convict a burgess.'

The most incompatible offices are often united in the person of the town-clerk. He very frequently acts as deputy-recorder; which practice, in our opinion, cannot be too strongly condemned. He is often, practically, the principal attorney for the prosecution of offenders tried at the borough sessions, whose commitment he had previously advised in his character of clerk to the magistrates. Even when his name does not appear to the prosecution, the same evil often ensues from its being in the hands of his partner. In York and Hull, great complaints have been made of the conduct of prosecutions by the town-clerk's partner, and in the latter place of the advantages which the rules of practice give him over other attornies. In Preston, the town-clerk is a member of the council, and his partner is the senior alderman, a magistrate, and a coroner. A strange incongruity sometimes appears in the election of the town-clerk to the office of mayor; in some places where this has occurred, an attempt has been made to gloss over the irregularity, by appointing another town-clerk during the year of his mayoralty. Whilst the same officer thus unites the characters of judge and prosecutor, the selection of the juries is often entirely committed to his discretion, and it cannot be a matter of surprise that suspicions of unfairness and partiality should be excited.

Civil Jurisdiction.—The same union of incompatible functions is found in these courts as in the courts of criminal jurisdiction.

If the recorder does not attend, the town-clerk becomes the real judge of the court, from the incompetence of the other magistrates to perform their duty.

At Reading, the town-clerk, during his mayoralty, tried and taxed the costs of a cause in which his partner was one of the attornies. In many towns, although he does not practise in the court of record as an attorney in his own name, he is the real attorney in the cause. At Kendal, the town-clerk's partner, who is an alderman, practises in the civil court. The same thing occurs at Scarborough, where the town-clerk acts as assessor in the civil court, and also taxes the costs.

The town-clerk often selects the juries in these as well as in the criminal courts, and they are often chosen from the same objectionable class.

The serjeants-at-mace and other ministerial officers of the court, who are placed in the situation of sheriffs, are often persons whose pecuniary responsibility is insufficient to afford any security to the suitors.

The costs of a suit in these courts, are, in general, very considerable, taking into account the fact that the expense of witnesses, which elsewhere is one of the heaviest charges in a suit, is here invariably light. The whole system of fees and costs in these courts is objectionable. There is, generally, no authorized table of them, and frequently no well-defined practice on the subject. They are mostly in the discretion of the town-clerk, though they are in some places taxed by the mayor.

Among other causes which have led to the disuse of these courts, may be accounted the want of professional skill in the judges. Nor can it be doubted that the intimacy which must necessarily exist between the judge and the parties who appear before him, has been one source of the disinclination to resort to these tribunals. A few minutes convert the tradesman and the customer into the judge and the suitor. Another prominent cause of the desertion of these courts has been the facility of removing the causes, and the general inclination on the part of legal practitioners to sue in the superior courts. The plaintiff, on procuring execution, can avail himself of it only within the limits of the local jurisdiction. His process therefore is frequently fruitless, the defendant removing himself and his goods beyond the limits of the court. This was a very common subject of complaint. These courts possess an unlimited power of imprisonment, which, in some cases, is made the means of great oppression.

Notwithstanding their defects, a very general desire was expressed on the part of the inhabitants of those boroughs where the civil courts had fallen into disuse, for their revival; and any system, which would have the effect of distributing justice where the parties interested reside, would be regarded as one of the greatest boons which the Legislature could confer.

Many of the evils we have enumerated as prevailing in the administration of criminal and civil justice, result from the continuance of jurisdiction after the decay of the borough. Even in the more important boroughs, great injustice results from entrusting the powers of sitting as magistrates in quarter sessions, and as judges of civil procedure, to persons not having professional knowledge and experience.

Gaols.—In the state of the borough gaols, we find additional proofs of the evils of continuing the present constitution of the local tribunals. Instances rarely occur in which the borough gaols admit of any proper classification of the prisoners. The prisoners are often without a proper supply of air and light: frequently the gaols are mere dungeons under the town-hall. In such receptacles it is impossible to put a prisoner to work, or to separate the criminals and the debtors.

It was frequently stated that the gaol of the borough was in so unfit a state for the reception of prisoners, that plaintiffs were unwilling to consign the defendants, against

whom they had procured execution, to confinement within its walls. At Saltash, it was said that the same feeling prevented the prosecution of criminals.

Police.—The police belonging to municipal corporations is for the most part very insufficient, and for supplying the deficiency resort is had to local acts. The superintendence of the police, and the powers necessary for watching, paving, lighting, cleaning, and supplying the towns with water, instead of being entrusted to the municipal authorities, are for the most part committed by these acts to various independent bodies, although none of these towns are too extensive to be embraced by one system of municipal government: for instance, every quarter of the town of Bath is under the care of a separate board, except one, which is totally unprotected. Much confusion results from this divided authority. The powers of local taxation, and the superintendence of matters so closely connected with the comfort and well-being of the inhabitants, which are now exercised by these bodies, appear to belong precisely to that class of objects for which corporate authority was originally conferred: but great dissatisfaction would prevail among the inhabitants, if these powers were entrusted to the municipal corporations as at present constituted. In several towns much apathy is now shown by the inhabitants with respect to the municipal benefits conferred by these acts. In Southampton, where the consent of the inhabitants is required to bring them within the powers of a local act, nearly half of the town has refused the benefit of it. Great jealousy often exists between the officers of police acting under the corporation, and those under the commissioners of these local acts: and the corporate body seldom takes any active share in the duties of the board, of which its members form a part. At Bristol, a notoriously ineffective police cannot be improved, chiefly in consequence of the jealousy with which the corporation is regarded by the inhabitants. At Hull, in consequence of the disunion between the governing body and the inhabitants, chiefly arising out of a dispute about the tolls and duties, only seven persons attended to suppress a riot, out of 1000 who had been sworn in as special constables, and on another similar occasion none attended. At Coventry, serious riots and disturbances frequently occur, and the officers of police, being usually selected from one political party, are often active in fomenting them. In some instances, the separate and conflicting authority of the commissioners is avowedly used as a check and counterbalance to the political influence of the corporation. At Leeds, no persons are elected commissioners of police whose political principles are not opposed to those of the corporation.

Extent of Local Jurisdiction.—The frequent occurrence of precincts, in the heart of the corporate towns, not subject to the authority of their magistrates, has been mentioned. Such places, by protecting offenders against the law, still present the same obstacles to an effective police, which were once found in sanctuaries.

Property.—The exemption from tolls or dues payable on the exportation or importation of goods in some of the great commercial towns constitutes the most valuable privilege of the free merchants, and is at the same time strongly complained of by the merchants who are not freemen. In Liverpool, one mercantile firm has paid to the town dues more than 1400*l.* in one year. Whatever may have been the origin of the tolls, in many cases they are now paid without any equivalent consideration being rendered by the corporations which enforce them.

By some corporations a revenue has been occasionally derived from very improper sources. The corporation of Tiverton had for many years an allowance from the receivers-general of the county of Devon, which allowance was stipulated for by the corporation, as a consideration for the exercise of their influence with one of the capital burgesses in obtaining the appointment.

The evils which have resulted from mismanagement of the corporate property are manifold, and of the most glaring kind. Some corporations have been in the habit of letting their lands by private contract to members of their own body, upon a rent and at fines wholly disproportionate to their value, and frequently for long terms of years. Others have alienated in fee much of their property for inadequate considerations. At Cambridge, practices of this kind have prevailed to a very great extent. In large towns, the most striking defects are carelessness and extravagance in the administration of the municipal funds, and an exclusive distribution of patronage among friends and partisans.

In some towns large sums have been spent in bribery and the other illegal practices of contested elections. During the election of 1826, the corporation of Leicester expended 10,000*l.* to secure the success of a political partisan, and mortgaged some of their property to discharge the liabilities incurred. In Barnstaple and Liverpool the funds of the corporation have been wasted in defending from threatened disfranchisement a body of freemen who had been proved guilty of bribery.

In general, the corporate funds are but partially applied to municipal purposes, such as the preservation of the peace by an efficient police, or in watching or lighting the town, &c.; but they are frequently expended in feasting, and in paying the salaries of unimportant officers. In some cases, in which the funds are expended on public purposes, an expense has been incurred much beyond what would be necessary, in consequence of the plan of avoiding public contract, and of proceeding without adequate estimates. These abuses often originate in the negligence of the corporate bodies, but more frequently in the opportunity afforded to them of obliging members of their own body, or the friends and relations of such members.

Few corporations admit any positive obligation to expend the surplus of their income for objects of public advantage. Such expenditure is regarded as a spontaneous act of private generosity, rather than a well-considered application of the public revenue; and the credit to which the corporation, in such a case, generally considers itself entitled, is not that of judicious administrators, but of liberal benefactors. Even in these cases, party and sectarian purposes often prevail in its application.

From this erroneous but strongly-rooted opinion, that the property of the corporations is held in trust for the benefit of the corporate body only, distinguishing that body from the community with which it is locally connected, the transition is not difficult to the opinion that individual corporators may justifiably derive a personal benefit from that property. At Cambridge, the practice of turning the corporation property to the profit of individuals was avowed and defended by a member of the council.

This principle has been undisguisedly adopted in few corporations compared with the number of those in which it is indirectly acted upon. Some sense of impropriety, indicated by the secrecy with which such transactions are conducted, has accompanied the execution of long leases for nominal considerations, or the alienations in fee of the corporate property to individual corporators. Advantages of a different kind are offered in the shape of salaries to sinecure, unnecessary, or overpaid officers.

The salaries to the corporate officers, in a great many instances, are not at all commensurate with their duties. The allowance to the chief officer is often very large, and it is well understood that he is to expend it in public entertainments. In some places, a considerable part of the revenues of the corporation appears to have been devoted to such purposes. An opinion was obviously entertained at many places, that any degree of expenditure for such purposes might be justified, if the corporation restrained itself within the limits of its permanent income, and did not tax the inhabitants to supply the means of such expenditure.

With the custom of conferring salaries that must be considered exorbitant, even when the officers chosen are competent to the proper discharge of their duties, may be classed the practice of bestowing important and high-salaried situations upon incompetent persons: both are among the many evils arising out of the system of self-election and irresponsible exercise of patronage.

Conduct of this description would probably have been checked by the mere force of public opinion, if the corporate accounts had been subjected to the scrutiny which must have resulted from the publication of them.

The debts incurred by many corporations, have been swelled to their present amount, by most negligent and improper management. At Berwick-upon-Tweed, where the freemen manage the affairs of the corporation, and possess commons of the value of about 6000*l.* per annum, they have borrowed money expressly for the purpose of dividing it amongst themselves.

Many of the close corporations have become indebted to the patron of the borough for sums of money advanced to them for municipal and other purposes.

Specific Trusts and Patronage.—Various funds and revenues have been entrusted to corporations for specific ob-

jects. Financial abuses of the same nature as those which we have already reported, are found in the management and application of these funds. At Lincoln, river-tolls were expressly granted for the maintenance of a navigation. The navigation has been neglected, to the great injury of the city, and the tolls have been converted into private property.

Other specific trusts are connected with charitable institutions and the administration of charity funds, which are under the control of the corporate authorities. Here again the commissioners find mismanagement and misappropriation to a considerable extent.

The corporation of Exeter is indebted to various charities a sum exceeding 17,000*l*. At Truro, the charity property has been let for a fine and a nominal rent. This nominal rent has been applied to the charity, and the fine has been appropriated to the purposes of the corporation. At Cambridge no accounts have been kept; but the misappropriation of these funds is not denied by the corporation. At Ipswich, malversations have long been matters of complaint.

At Winchester, the management has been actually taken from the corporation in consequence of notorious malversation.

The patronage connected with these trusts, has in numerous instances been exercised by the corporate authorities, to gain or reward votes both at the municipal and parliamentary elections.

At Norwich, the patronage of the hospitals, which is vested in the aldermen, has been avowedly exercised in favour of their own party. Promises have been given to freemen, to place them on the foundation, in return for their votes at elections, and weekly pensions have been allowed till these promises could be fulfilled.

At Leicester, Coventry, and Northampton, the corporations have exercised similar patronage for the same corrupt purposes At Boston, party distinctions in the distribution of a charity-fund were avowed and justified by one of the magistrates. At Ipswich, it is notorious that pensioners upon the foundations, which are under the control of the corporation, are selected with the same view, and that their participation in the charity is the price of their votes at municipal elections. Some of the funds entrusted to this corporation have disappeared altogether. These instances prove that a provision for the poorer classes of the community, in the hands of the corporate authorities, has become a source of corrupt influence.

In some boroughs the corporation nominates the masters of the schools, many of which are endowed. At Tewkesbury, where the master's conduct was complained of, it was said that no redress could be obtained, because he was one of the borough justices, by whom the master is appointed and visited. From various causes, sometimes from the improper selection of the master, as at Derby, sometimes from making the education exclusively classical, the schools have become in a great measure useless to the inhabitants, and much valuable property given for the purposes of education is thus wasted. At Derby the school was once full of scholars; recently it contained only one pupil. At Coventry the funds of the school amount to 900*l*. per annum; the two masters divide about 700*l*. between them, but had only one pupil in 1833, and for one or two years previously. A great desire was expressed in many places by the inhabitants for the revival of the schools, and that they should afford the elements of an useful English education.

The commissioners terminate their Report in the following terms:—

"We have now laid before your Majesty, as concisely as possible, an enumeration of the principal defects which we have found in the constitution and management of the municipal corporations in England and Wales. We humbly certify to your Majesty, that the statements contained in this Report are amply confirmed in detail by the results of the inquiries instituted in the several corporations, which results are embodied in the separate reports to which we have already referred. Even where these institutions exist in their least imperfect form, and are most rightfully administered, they are inadequate to the wants of the present state of society. In their actual condition, where not productive of positive evil, they exist, in the great majority of instances, for no purpose of general utility. The perversion of municipal institutions to political ends has occasioned the sacrifice of local interests to party purposes, which have been frequently pursued through the corruption and demoralization of the electoral bodies.

"In conclusion, we report to your Majesty that there prevails amongst the inhabitants of a great majority of the incorporated towns a general, and, in our opinion, a just dissatisfaction with their municipal institutions; a distrust of the self-elected municipal councils, whose powers are subject to no popular control, and whose acts and proceedings being secret, are unchecked by the influence of public opinion; a distrust of the municipal magistracy, tainting with suspicion the local administration of justice, and often accompanied with contempt of the persons by whom the law is administered; a discontent under the burdens of local taxation, while revenues that ought to be applied for the public advantage are diverted from their legitimate use, and are sometimes wastefully bestowed for the benefit of individuals, sometimes squandered for purposes injurious to the character and morals of the people. We therefore feel it to be our duty to represent to your Majesty that the existing municipal corporations of England and Wales neither possess nor deserve the confidence or respect of your Majesty's subjects, and that a thorough reform must be effected before they can become what we humbly submit to your Majesty they ought to be, useful and efficient instruments of local government."

CHANGES OF ADMINISTRATION, AND HISTORY OF PARTIES.

[Continued from last Number.]

FOR some months after its entrance into office, the Rockingham administration was left to arrange its plans without anything occurring to give it disturbance or apprehension. The King, as far as is known, treated all the members of his new cabinet with civility at least, if not with very marked cordiality and confidence. The prorogation of Parliament, which had taken place on the 19th of April, immediately before the late changes, relieved them in the meantime from the active warfare of party; and the public mind, although not perhaps greatly confiding in the permanence of the recent arrangement, was certainly not indisposed to allow it a fair trial. The Ministry, in so far as it was distrusted, was so in consequence not so much of any individuals who formed part of it, as of those whom it did not include. Its head in particular, the Marquis of Rockingham, was universally esteemed as a person both of considerable abilities and of the most upright intentions; but there undoubtedly was a feeling of disappointment that a more distinguished name—that of Mr. Pitt—did not lend its lustre to the King's Government.

In the end of October, the Ministry sustained an important loss in the death of the Duke of Cumberland, who had been principally instrumental in bringing them into power, and who formed one of their chief supports both with the nation and with the King. The smooth waters in which they had hitherto proceeded were also about the same time suddenly made rough by the beginning of a storm which it soon required all their skill and exertions to weather.

Not deterred by the strong dissatisfaction which had been excited in North America by the resolutions asserting the expediency of raising a revenue from the colonies by a stamp-duty, which, as already mentioned, had been passed by Parliament in the session of 1764, Mr. Grenville had, in the last session, proceeded to execute the threat then held out, by bringing in a bill for the actual imposition of the tax. That bill having passed the Commons by a large majority, and the Lords without any opposition whatever, received the royal assent on the 22nd of March, 1765. The news, which reached America in May, immediately set the country in a blaze from one end of it to the other. It was not, however, till some weeks afterwards that any actual disturbances took place. The first accounts that seriously alarmed the Ministry, appear to have been received in England about the end of October. But even then they seem to have thought that the danger might probably wear away if things were merely allowed to take their course. In January following, when vindicating himself and his colleagues for not calling Parliament sooner together, Mr. Conway said in the House of Commons, 'I can assure the House, the first accounts were too vague and imperfect to be worth the notice of Parliament. It is only of late that they have been precise and full.' The first mention we find him making of the subject in his letters to his brother, (the manuscript collection noticed in our last number,) is under date of the 14th November, 1765, when he says, 'Our

Americans are very riotous indeed; it is a serious business, and for me doubly difficult, unless we find lenity the plan.'

In point of fact, the Ministers were very much at a loss what measures they ought in this emergency to propose to Parliament when it should assemble. They had not only to consider what course the two Houses would be likely to sanction, and what the King would give his assent to, but, for a time at least, there was also probably considerable difference of opinion among themselves, as to the most expedient mode of proceeding. And their deliberations were further embarrassed by the known disposition of the adherents of the late government, who were still a formidable body in the House of Commons. 'No sooner,' says Mr. Burke, in his famous speech on American Taxation, delivered in 1774, 'had the sound of that mighty tempest reached us in England, than the whole of the then opposition, instead of feeling humbled by the unhappy issue of their measures, seemed to be infinitely elated, and cried out, that the Ministry, from envy to the glory of their predecessors, were prepared to repeal the Stamp Act.' In these circumstances it was not till the very last moment that Lord Rockingham and his colleagues could make up their minds to advise the repeal. They had not even come to any definitive resolution on the subject, when Parliament at length re-assembled on the 17th of December. But all that was then done, was to issue writs for filling up the numerous vacancies that had been occasioned by the recent appointments to office; after which both houses adjourned on the 20th to the 14th of January, 1766.

In the interim a meeting of the principal members of the Government was held at the house of Lord Rockingham, at which it was arranged after full deliberation, that the Stamp Act should be repealed, but that a declaratory act should be at the same time passed, asserting the supreme authority of the mother country over the colonies in all cases whatsoever.

There is reason to believe that this plan of proceeding, if not originally suggested by Mr. Burke, was adopted chiefly through his strenuous advocacy. It had also the approval of Dr. Franklin, who was then in England, and in communication with the Ministry on the part of the Colonies. It had thus the recommendation of satisfying two at least of the various opinions which were entertained on the subject of American taxation; for the declaratory act was undoubtedly viewed in very different lights by Burke and Franklin. The former considered it absolutely necessary that the mother country should possess the right of taxing the Colonies in case of necessity. The latter merely submitted to the assertion of such a right, in the belief that it never would be exercised, and that, lying dormant in the statute book, it would do neither good nor harm.

There were however two extreme parties, whom, although diametrically opposed to each other, the projected line of policy was calculated to unite for the moment in hostility against the Government. There were on the one hand those who were so strongly opposed to the claim of the mother country to what was called the right of *internal* taxation in regard to her colonies, that they would not give their consent either to its exercise, or even to its assertion; and on the other there were those who maintained, not only the right, but the expediency of exercising it. The proposed declaratory act offered the desired point of attack to the former; and the repeal act gave a similar advantage to the latter.

The Ministers, however, having determined upon their course, prepared boldly to face whatever opposition they might have to encounter. Some notion of what they themselves thought of their prospects, may be gathered from various passages in Mr. Secretary Conway's confidential communications to his brother, now before us. Lord Hertford, upon the formation of the present Cabinet, had been appointed Lord Lieutenant of Ireland; and in the letters which passed between the two brothers, the public affairs of that country form a principal topic. Writing from London, under date of the 7th November, 1765, Mr. Conway says, 'Your opposition of nine is a pretty little opposition. I should be glad to compound with our opposers for six times that number, and on this head have an unpleasant article to tell you, which is, that Barré (Colonel Barré, who for many years made a considerable figure as one of the leading orators of the more decided section of the Whig party of that day) has refused; I have this day received his very civil, but direct excuse. He is pleased to say he knows very little of the present Administration but myself, and has no knowledge *of the plans of Government*, &c. That is the fashionable language of the great, and almost of the little too; every body is minister, every body plans and lays systems of government. Happy times, which abound in so many great and wise men! What I observe in general is, that every body knows how to govern, but those that should. I know you'll think our affairs quite desperate, after the chasm the poor Duke (of Cumberland) has made, and this capital refusal. Yet we don't at all think so—nor does his Majesty; but rather flatter ourselves the strength on the whole is good and promising. Ch. T. (the able and versatile Charles Townshend, one of the most distinguished figures of that time, but best remembered now from the character drawn of him by Burke; he held the office of Paymaster of the Forces in the present Administration, having succeeded Mr. Fox) is very much disposed and very sanguine; my Lord Chancellor declares himself roundly and strongly, and laughs at all despondency. It is not foreign from our thoughts, *privately* to sound Mr. P. (Pitt); to do it publicly would hurt the cause in this moment; though some time hence it might do us service to have it known it was done. Don't be surprised, *entre nous*, if you hear that I am out again, I mean out of what I am in. You know how I hate this life, and it raises my spirits much to think I see an hole to creep out at. C. T. (Charles Townshend), with all his cordiality, fixes conditions to his good will: *Confidence and the Cabinet* were the word a little while ago; now *he wishes to be useful*, and the way in which he can be so most, is as *Leader of the House*. I closed at once, with the addition, that he should then be Secretary of State too—this only to Lord R. (Rockingham) and the D. of G. (Duke of Grafton, the other Secretary of State) to whom I think aloud; but to day I have privately heard, that he has said in a letter that things were changed since he refused; he did it then on his brother's account, &c., which gives me hopes of doing what I much wish, laying aside my grandeur and my trouble, and the slavery of being tied to a desk, and taking his comfortable employment now, till I can wind about again into the situation I wish, in the army. That's my plan; it suits all my views and ambition, though it will be despised and condemned by many:—if I felt that much, it's clear I should not choose it. This for *ourselves*:—that I dislike my station all the world may know.' On the 14th November he writes in much the same tone: 'You say I must have been in Ireland to know how much business you have. I was in Ireland, and to be sure not in an idle station (he had been Irish Secretary in 1755, when the Marquis of Hartington was Lord Lieutenant), yet, for my sins, it is now *in England* I learn what business really is, and learn to be so sick of it, I envy every captain I see.' These are interesting revelations. Indolent and unambitious, and with his heart in his profession, Conway certainly was not a man fashioned to enjoy as many would do the giddy elevation of the place he now occupied. His tastes, feelings, and habits of thought and action, indeed, were all such as to make him feel out of his proper element while a member of the Cabinet. The duties and necessities of his situation here, demanding, as they must have always done, coolness, reserve, and caution—sometimes, perhaps, a good deal of manœuvring and compromise—must have been felt as a burdensome and irritating restraint by a person of his frank, liberal, and generous temperament. We have mentioned already the apprehension he expresses in this very letter lest a course should be adopted as to American affairs which might involve him in embarrassment. In another, written a few weeks before, telling his brother the gratification with which he had heard of his encouragement of the Irish manufactures by some domestic regulations he had made, he characteristically adds—'I, who retain a little spice of my opposition spirit, and think that the satisfaction and advantage of multitudes outweighs a thousand private inconveniences.'

In a subsequent part of his letter of the 14th November, he says—'I have little news of a domestic kind. I believe I told you Barré refuses; that you'll dislike, and yet I think we much rather gain than lose ground on the whole, notwithstanding even our late unhappy loss' (the death of the Duke of Cumberland.) On the 27th of December, during the adjournment, he writes—'As to our affairs here, I can tell you nothing new, at least with any certainty

Mr. Pitt has declared, in general terms, strongly in favour of our measures: yet he keeps at Bath, and at a distance every way. Beckford, Cooke, Prowse, and other independent men, are strongly with us: if anything goes wrong, it will be by a rottenness within. A certain party kept aloof, and, the world says, are certainly forming a *bande à part*: I mean Lord B.'s (Bute's) friends—the two Townshends particularly: and if they have a mind, the American affairs will give them an opportunity to be troublesome. Lord Shelburne and Barré seem particularly fixed nowhere. Lord Temple and Lord Lyttleton will, I think, both oppose. The Lord Chancellor and the Yorkes are, in appearance, very mum. Lord Mansfield and Lord Camden doubtful. This is a little sketch of our political anatomy. What opinion does it give you?"

When Parliament at length re-assembled, on the 14th of January, 1766, no amendment was moved to the Address in the Lords; but an interesting debate took place in the Commons, in the course of which the leaders of most of the various parts in the House took up their ground, and announced, at least in so far, the views they held. Mr. Pitt approved of the Address on the ground that it decided nothing, and left every member at perfect liberty to take such a part concerning America as he might afterwards see fit. Turning to Mr. Grenville, near to whom he stood, he said that, as to the late Ministry, every capital measure they had taken had been entirely wrong. Then looking over to the bench where Mr. Conway sat with the Lords of the Treasury, he proceeded—"As to the present gentlemen, to those at least whom I have in my eye, I have no objection; I have never been made a sacrifice by any of them. Their characters are fair; and I am always glad when men of fair character engage in his Majesty's service. Some of them have done me the honour to ask my poor opinion before they would engage. These will do me the justice to own I advised them to engage; but, notwithstanding, I love to be explicit; I cannot give them my confidence; pardon me, gentlemen (bowing to the Ministry), confidence is a plant of slow growth in an aged bosom; youth is the season of credulity. By comparing events with each other, reasoning from effects to causes, methinks I plainly discover the traces of an overruling influence." He then stated his opinions as to American affairs:—"It is my opinion," he said, "that this kingdom has no right to levy a tax upon the colonies. At the same time I assert the authority of this kingdom over the colonies to be sovereign and supreme in every circumstance of government and legislation whatsoever. Taxation is no part of the governing or legislative power. The taxes are a voluntary gift and grant of the Commons alone. In legislation, the three estates of the realm are alike concerned; but the concurrence of the Peers and the Crown to a tax is only necessary to close with the form of a law. The gift and grant is of the Commons alone."

When Mr. Pitt sat down, Mr. Conway rose, and declared that his own sentiments were entirely conformable to those of the right honourable gentleman. "That they are so conformable," he added, "is a circumstance that affects me with most sensible pleasure, and does me the greatest honour." It is extraordinary that Mr. Conway should have expressed himself in such terms as these, while he had in his pocket the resolution about to be proposed, declaring the British Parliament to have full power and authority to make laws and statutes of sufficient force and validity to bind the colonies *in all cases whatsoever*; and his conduct would be altogether unaccountable had we not seen how Mr. Pitt himself, while denying the right of England to tax America, could still assert the authority of the former in terms quite as ample. It is certain, however, that Mr. Pitt's novel and singular distinction, if it was acquiesced in by Mr. Conway, was not adopted by his colleagues in the Cabinet, and was not the principle of the declaratory act which they afterwards brought in.

Before he sat down, Mr. Conway took occasion emphatically to deny the existence of the overruling influence (that, namely, of Lord Bute) at which Mr. Pitt had hinted. "I see nothing of it," he said; "I feel nothing of it; I disclaim it for myself, and, as far as my discernment can reach, for all the rest of his Majesty's Ministers."

The Address was voted without a division, in the terms proposed by Ministers. Both Houses then resolved themselves into committees for the examination of papers and persons in relation to the American disturbances; and in this task they were engaged for some weeks.

The Report of the Committee of the Lords was brought up on the 10th of February, and on the same day five resolutions were moved by Ministers, asserting the full sovereignty of the mother country, and reprobating the resistance which had been offered to the Stamp Act. Nothing was said as to the repeal of that act. In the debate which ensued, the Duke of Grafton distinctly declared his opinion to be that the Americans were as liable to be taxed as any man in Great Britain; and he intimated that it was to put down any doubt upon that point that the first of the five resolutions was proposed. Lord Shelburne spoke next. He gave no direct opinion on the right of Parliament to tax America, but was understood rather to admit the right. He deprecated, however, the bringing of constitutional matters into debate without necessity, and contended that it would be much better to pass merely an act repealing the stamp duty, without any declaratory act. His Lordship was at this time looked upon as the head of the party to which Colonel Barré belonged. Lord Lyttleton, who followed, asserted the right of taxation in the strongest terms. His Lordship and Lord Temple, since the reconciliation of the latter with his brother, Mr. Grenville, may be considered to have completely joined the Tory opposition, or party of the late Ministers. Lord Lyttleton was answered by Lord Camden, who upon this occasion made his first speech in the House of Lords, and endeavoured to maintain, by a long historical deduction, the same doctrine which had been propounded by Mr. Pitt in the House of Commons. The arguments of his Lordship were replied to, first, by the Chancellor Northington, and after him by Lord Mansfield: and the former of these two noble Lords, though a member of the Government, signified intelligibly enough in the course of his speech that he was even opposed to the act of repeal. The resolutions were eventually agreed to.

We will now give another passage from one of Mr. Conway's letters, which reveals certain movements that were going on in the meantime out of the public view. On the 13th of February he writes:—"As to politics, I can scarce say what it is in my power to tell you. Our divisions in the two Houses respectively you have heard;* their consequences are not easily ascertained. His Majesty had told Lord Rockingham and the Duke of Grafton that he was for the repeal: but he on Tuesday told Lord Strange that he was *not so now*—that he wished his opinion to be known, and his Lordship might declare it. This ran through the House of Commons and the town, and has had an odd effect. Our ministerial lives were not thought worth three days' purchase. His Majesty has been pleased to explain himself to us, that he always was for the repeal, when contrasted with enforcing the whole act, but not as compared with *modification*. We told his Majesty this distinction was unfortunately not explained to us: and that in consequence we had (as he had allowed Lord Rockingham particularly to do) declared his Majesty to be for the repeal: and that on all accounts we were engaged and obliged to push that measure. It was very mortifying to us, and very unhappy, that it now appeared to be against his Majesty's sentiments, which put us into an odd predicament, being under a necessity of carrying on a great public measure against his Majesty's declared sentiments, and with great numbers of his servants acting against us. He was not displeased, he said, with our freedom—thought we acted like honest men—had no design of parting us—always foresaw the difficulties which might attend his business—but that, once over, he hoped *all things would go smoothly again*. You see that this might branch out into very long details, had I time for them: but this is the substance. 'Tis a whimsical situation, and what will be the event I don't know. I think the Bill of Repeal will probably pass, because our disposition for it is too strong in the House of Commons for *anything* now to conquer; and the Lords, I think, with submission, dare not resist it."

On the following Thursday, at past ten o'clock at night, he adds:—"I am this moment returning from the House of Commons, and shall now close my long letter with telling you that I have heard, from *very good* authority, that no junction between Lord Bute's and the Bedford party is formed. He says he has been asked, and refused absolutely; and that they have been mean enough to apply to him directly and in person—to acknowledge their former errors in

* Up to this time we find no divisions recorded in the common accounts of the parliamentary proceedings.

regard to him—and to ask a combination. How much has one more to learn of the excessive corruption and pitiful meanness of the times! There is at least one advantage of high stations, though 'tis a melancholy one—that of seeing the inside of the cards, and being more acquainted with the depravity of our fellow-creatures."

The letter concludes with the following loose paragraphs: "I think our ministerial stocks much risen to-day; we hold our own ground, and our own way steadily, without caballing, and without looking to the right or left; and I think, for some time at least, we shall be able to hold up our heads. I can't about no period beyond the repeal of the Stamp Act.

"Lord Rockingham wrote down and showed to the King the words of his Majesty's declaration to him—*that his Majesty was for the repeal, and that he* (Lord Rockingham) *was at liberty to say so.* His Majesty allowed and approved them; but added to them with his pencil—*that he thought the question then was between total enforcement and total repeal.*

"I was told to-day by a gentleman, who said his authority was *incontestable*, that a change of ministry was now settled, and would be declared to-morrow. It is impossible—if anything can be so.

"P.S.—You see how delicate this ground is, and will use my intelligence accordingly."

In the House of Commons the committee of the whole House did not bring their examination of papers and persons to a close before the 21st of February. Burke, in going over the history of the proceedings in his great speech in 1774, says—"I think the inquiry lasted in the committee for six weeks; and, at its conclusion, this House, by an independent, noble, spirited, and unexpected majority—by a majority that will redeem all the acts ever done by majorities in Parliament—in the teeth of all the old mercenary Swiss of State—in despite of all the speculators and augurs of political events—in defiance of the whole embattled legion of veteran pensioners and practised instruments of a court—gave a total repeal to the Stamp Act, and (if it had been so permitted) a lasting peace to this whole empire."

The vote here alluded to is that of the committee on the 21st of February, in favour of the last of the seven resolutions which it was resolved to report to the House—that recommending that leave should be given to bring in a bill for the repeal of the Stamp Act. The numbers on the division were—275 for the resolution, and 167 against it. No account of the discussion is preserved in the printed reports of the 'Parliamentary Debates;' but it was no doubt on this occasion that the scene took place which is so nobly described in a subsequent passage of the speech to which we have just referred:—"I will do justice—I ought to do it—to the honourable gentleman who led us in this House (Mr. Conway). Far from the duplicity wickedly charged on him, he acted his part with alacrity and resolution. We all felt inspired by the example he gave us, down even to myself, the weakest in that phalanx. I declare for one, I knew well enough (it could not be concealed from any body) the true state of things; but, in my life, I never came with so much spirits into this House. It was a time for a man to act in. We had powerful enemies, but we had faithful and determined friends, and a glorious cause. We had a great battle to fight, but we had the means of fighting: not as now, when our arms are tied behind us. We did fight that day, and conquer.

"I remember, Sir, with a melancholy pleasure, the situation of the honourable gentleman (Mr. Conway) who made the motion for the repeal, in that crisis when the whole trading interest of this empire, crammed into your lobbies, with a trembling and anxious expectation, waited, almost to a winter's return of light, their fate from your resolutions. When at length you had determined in their favour, and your doors thrown open, showed them the figure of their deliverer in the well-earned triumph of his important victory, from the whole of that grave multitude there arose an involuntary burst of gratitude and transport. They jumped upon him like children on a long absent father. They clung about him as captives about their redeemer. All England, all America, joined in his applause. Nor did he seem insensible to the best of all earthly rewards—the love and admiration of his fellow-citizens. *Hope elevated and joy brightened his crest.* I stood near him, and his face, to use the expression of the scripture of the first martyr, 'his face was as if it had been the face of an angel.' I do not know how others feel; but if I had stood in that situation, I never would have exchanged it for all that kings in their profusion could bestow. I did hope that that day's danger and honour would have been a bond to hold us altogether for ever; but, alas! that, with other pleasing visions, is long since vanished."

The report of the committee was brought up on the 24th, and the question of receiving it gave rise to a long debate, which has not been reported. It appears, however, that an amendment which was moved upon the resolution recommending the repeal, was rejected by a majority of 240 to 133. Soon after one o'clock on the morning of the 25th, the House adjourned till the 26th, on which day the two bills were brought in according to order: that for the better securing the dependency of the colonies by Mr. Fuller, and that for the repeal of the Stamp Act, immediately afterwards, by Mr. Secretary Conway. Both bills having been read once, were ordered to be read a second time next morning. The printed accounts of the debates give us no further account of the progress of either, merely stating that both eventually passed the House. Mr. Conway, however, writing to his brother on the morning of the 27th, says—"Our act of *Repeal* is read the second time to-day, together with that of *Right*—if they'll permit us; but the determined opposition hitherto given, and promised as we proceed in any stage of this bill, makes it impossible to determine the progress we shall make." In a subsequent letter, dated the 5th of March, he supplies us with the following particulars: "I don't wonder you are puzzled with our politics: they never were more a riddle. However, on Tuesday the Repeal Bill passed our House by a majority of 250 to 122, though under the same disadvantages as to the parties engaged against it. Nothing could more strongly mark this than a ridiculous incident which happened that night in the House; for Mr. B. Gascoigne, for what reasons he perhaps may know, read a letter in the House, which he said was writ to a person at Liverpool. In it was an account of one of our former debates and divisions, which, it said, was carried by a great majority, notwithstanding there were joined in the opposition to it all Lord Bute's friends, the Duke of Bedford's, Mr. Grenville's, and the Tories; and the letter ended by saying that Mr. Pitt must soon be at the head of affairs. You may imagine the effect so strange a circumstance must produce—the gross impropriety of reading a private letter—the direct denomination of persons—and the awkwardness to the parties concerned. However, the novelty of the thing, the curiosity, and the satisfaction of the majority in the House, and the conscious shame in others, were so prevalent, that the absurdity of the fact was lost and forgot: the more, as Mr. Pitt, with infinite cleverness, seized the opportunity—talked of the history of the times—the supposed conjunction of parties, at least the attempts towards it—and the conferences that a *bird sung* had been held, alluding to the well-known conversations between the Duke of Bedford and Grenville, and my Lord Bute, in which he (Pitt) said, *if the bird sung true*, that nobleman, in refusing to enter into any combinations, had done himself honour, and showed himself a friend to his King, and to the true interest of his country, &c. I suppose you know that Lord Bute and his friends have *published*, that in these conferences the Duke of Bedford and George Grenville actually recanted all their former abuse and behaviour, and proposed *friendship* and *alliance*; and that his Lordship, with great dignity, said, "It was pleasing to any man to have justice done him, and that he had no objection to their friendship which they offered: but that, if they meant to go farther, and to propose any kind of political connexion, or any factious engagement, he was resolved to have no part in it, &c." You may imagine, then, how these explanations embarrassed the Grenville and Bedford party. Mr. Grenville showed it to the greatest degree—spoke in great anger, and called upon Mr. Pitt for farther explanation, but gave none himself; and Mr. Pitt, who replied in the same strain of temper and humour he had spoke (in) before, only said coolly, he saw no reason the gentleman had to be angry; and that, having told all he had heard of the story, he did not see how any farther explanation was wanting. The bill was carried up yesterday: the Repeal by me, and the Bill of Right by our chairman, Mr. Rose Fuller. To-morrow the Lords will take the latter into consideration; the other, I think, probably not till Monday, and I have no doubt of its being carried there. For the rest, our affairs are still critical in the ministerial light. I think, however, I see daylight

for some solid settlement; I wish I could say it was clearer. Mr. Pitt is not averse to coming in, but sees great difficulties, he says, almost to impracticability."

The Repeal Bill encountered great opposition in the House of Lords, but it eventually passed. A long debate, in particular, took place on the 11th of March, after it had been read a second time, on the question that it should be committed. On this occasion, besides the Dukes of Newcastle and Grafton, and others of the Ministers (among the rest, the Chancellor, who shortly before had seemed adverse to the measure), both Lords Camden and Shelburne supported the bill. On the other hand, it was opposed, among others, by Viscount Townshend (the brother of Mr. Charles Townshend), Lord Mansfield, the Duke of Bedford, Lord Lyttleton, and Earl Temple. When the House divided, the numbers were found to be—contents, 105; not contents, 71. The minority recorded on the Journals their hostility to the measure in a long protest, which was signed by 33 Peers. On the 17th, another debate took place on the motion for the third reading, in the course of which the Tory Peers (the Earl of Bute and Lord Gower) addressed the House against the measure. The motion was carried by a majority of 34. Twenty-eight Noble Lords signed a second protest against the decision which the House came to on this occasion. The bill received the Royal assent on the 20th.

All this while, however, the position of the Ministry was becoming every day more difficult and insecure; and notwithstanding the manner in which—supported by public opinion, and some of the strongest interests in the country—they had so far been enabled to maintain their ground in the parliamentary campaign, it was felt both by themselves and others that things could not long remain in the state in which they were. The formidable dangers and embarrassments by which Lord Rockingham and his colleagues were surrounded on all sides, have been forcibly sketched by Mr. Burke in another passage of his great speech:—"The Noble Lord who then conducted affairs, and his worthy colleagues, whilst they trembled at the prospect of such distresses as you have since brought upon yourselves, were not afraid steadily to look in the face that glaring and dazzling influence at which the eyes of eagles have blenched. He looked in the face one of the ablest, and, let me say, not the most scrupulous, oppositions, that perhaps ever was in this House; and withstood it, unaided by even one of the usual supports of administration. He did this when he repealed the Stamp Act. He looked in the face of a person he had long respected and regarded, and whose aid was then particularly wanting: I mean Lord Chatham. He did this when he passed the Declaratory Act. . . . I confess, when I look back to that time, I consider him as placed in one of the most trying situations in which, perhaps, any man ever stood. In the House of Peers there were very few of the Ministry, out of the Noble Lord's own particular connexion (except Lord Egmont, who acted, as far as I could discern, an honourable and manly part), that did not look to some other future arrangement, which warped his politics. There were, in both Houses, new and menacing appearances, that might very naturally drive any other than a most resolute minister from his measure or from his station. The household troops openly revolted. The allies of the Ministry (those, I mean, who supported some of their measures, but refused responsibility for any) endeavoured to undermine their credit, and to take ground that must be fatal to the success of the very cause which they would be thought to countenance. The question of the repeal was brought on by Ministry, in the committee of this House, in the very instant when it was known that more than one court negociation was carrying on with the heads of the opposition. Every thing, upon every side, was full of traps and mines. Earth below shook—heaven above menaced—all the elements of ministerial safety were dissolved. It was in the midst of this chaos of plots and counterplots—it was in the midst of this complicated warfare against public opposition and private treachery, that the firmness of that noble person was put to the proof. He never stirred from his ground—no, not an inch; he remained fixed and determined in principle, in measures, and in conduct; he practised no managements; he secured no retreat; he sought no apology."

In these circumstances the eyes of the country were generally [illegible] to Mr. Pitt; and a junction with that distinguished [illegible] was also the desire and hope of some, at least, among the ministers themselves, and especially of the Duke of Grafton and his friend Mr. Conway. Several of the passages we have quoted from the letters of the latter show sufficiently how he felt. From a minute by Mr. Nuthall, Solicitor to the Treasury, which has been printed in the Rev. F. Thackeray's 'History of Lord Chatham' (vol. ii. p. 76), it appears that so early as the end of February an attempt to open a negociation with Pitt had been made by Lord Rockingham himself. Mr. Nuthall, who was the medium of the communication from his Lordship, has recorded Mr. Pitt's reply in the following terms:—"In answer to the honour of Lord Rockingham's message by Mr. Nuthall, Mr. Pitt desires to assure his Lordship that he should be proud and happy to confer with Lord Rockingham, the Duke of Grafton, and Mr. Conway, openly and unreservedly, upon the formation of an administration, if respect and duty to the King did not indispensably forbid him without his Majesty's express commands so to do, sensible that nothing but the King's most gracious pleasure that he should lay his feeble thoughts in the royal presence at his Majesty's disposal can acquit him, as a private individual, of the highest presumption in obtruding his opinion in a matter of this nature. Mr. Pitt cannot enough express the sense he has of the honour Lord Rockingham, the Duke of Grafton, and Mr. Conway do him by this mark of their favourable opinion, and trusts that difficulties, on his part, from the nature of things insurmountable, will not be construed into any want of regard, inclination, or confidence."

Mr. Nuthall's minute is dated the 27th of February. From the expressions here attributed to Mr. Pitt, it has been supposed that in an interview with the King something had been said which he thought precluded him from conferring with the Marquis of Rockingham, respecting the formation of a Ministry, without the express command of his Majesty; but this inference seems unnecessary. It rather appears that Mr. Pitt professed to hold generally that it was improper for a person in his situation—or perhaps for any private individual—to enter into such a negociation as that proposed without having received the command of the King. He probably also thought it due to himself to stand aloof until his advice should be desired by his Majesty. This may be inferred from what is stated in the following passage of a letter of Mr. Conway's, dated the 29th of April. For a short time previous to this, Mr. Conway had been absent from Parliament in consequence of illness. He says: "We are in a most embarrassed situation here, and all business either moves slowly, or stands still. While I was ill, Mr. Pitt took a fit of *rest*, because he was not applied to, nor treated with; he came down one day, picked a German quarrel, and fell upon the Ministry pretty roughly: since that, he has continued much in the same strain, though still professing not to act hostilely, and speaking with particular regard of the Duke of Grafton and myself. He has not, however, done anything directly hostile, except on the militia affair; but Lord Shelburne's brother voted against Mr. Dowdeswell on the tax, last day (Monday). Barré (for it the former day) was now absent; but Beckford, Cooke, &c., voted for it.

I went with the Duke of Grafton last night to Mr. Pitt, as I have been absent all this time, and not yet at the House, to see if there was a possible means yet of doing anything with him, and to express my opinion and inclinations, and my vexation for what had happened during my illness, when he thought himself slighted and neglected. He was exceedingly civil, and I think, too, as much disposed to come in; but then the insuperable bar of his going *immediately* to the King remains; he makes it a *sine qua non*; and his Majesty is strongly resolved against it. So there, I think, it ends. The Duke of Grafton, on this, has taken his absolute resolution to resign; and it seems doubtful for the rest whether we shall or can go on. Lord Bute's people have still been shy, and none of them have given any support; which if it does not alter, it is ridiculous to continue; it must immediately be resolved.

"I began this on Tuesday, and had not time to finish. It was Wednesday evening I went with the Duke of Grafton to Mr. Pitt, hearing he was to go out of town immediately, and, it appearing so strongly by all I had heard that he was disgusted, thought himself neglected, and that some new system had been adopted with regard to him. I was resolved to explain to him my own consistency with what I had professed—that I knew of no such change—and, though I saw very little hopes of success, to make a last effort, and know from him whether there were yet any means

left by which he might be brought to act with us. "I was told that this would exasperate him the more; that if we went without any proposition from the King, he would say we only came to sound him, &c. However, I thought I know my ground better; I was convinced of his regard for the Duke of Grafton, and of the opinion he constantly expressed of me; and I found my ideas fully confirmed. Nothing could be more polite than his reception: nothing more fair and temperate than his discourse, in a long conversation. I am sure he was pleased with the visit, and took perfectly in good part all I said, though I told him what, I believe, had never been told him plainly before,—that I was sure the King would not at present send for him—and then submitted to him whether, when the end was so great (as there appeared little hopes of any solid settlement without him) there might not be some little relaxation in the means? He took it vastly well; but said, as he had but very little hopes before of coming to any satisfactory agreement, so this, which he looked upon as a fresh indication of the little disposition there was at present in his Majesty towards him, made him the more resolved to follow his plan of retreat, which has his real inclination, seeing little comfort in being concerned in public business in so critical and difficult a situation, and so constituted as men and things were in this country; and that he should, in a few days, go down to Bath, and from thence to his house in Somersetshire, and should probably hereafter take little or no part in any public affairs, even in the House; where, however, any very essential questions might still call him if his health permitted. Much more passed, but this was the substance; and he ended with a compliment to me, and with saying he was sorry for the trouble I was like to have, and the burden that would probably lie upon me. I omitted that he declared he should never act an hostile part to this Administration, or to any set of men, while they pursued those measures which he had declared himself a friend to: and that he should be always ready, whenever his Majesty's sentiments should change, to obey any commands he might have for him."

About a fortnight after this letter was written, the Duke of Grafton resigned, as we find it here stated that he intended to do. His Grace, according to the account given by Lord Chesterfield in a letter to his son, dated the 13th June, declared in the House of Lords "that he had no objection to the persons or to the means of the present Ministers; but that he thought they wanted strength and efficiency to carry on proper measures with success; and that he knew but one man (meaning Mr. Pitt) who could give them that strength and solidity; that under this person he should be willing to serve in any capacity, not only as a general officer, but as a pioneer, and would take up a spade and a mattock." The seals of Secretary of State were offered first to Lord Egmont and then to Lord Hardwicke, and refused by both. Lord Hardwicke, however, consented to give his countenance and aid to the Ministry by accepting a seat in the Cabinet without an office. The Duke of Richmond, who, Lord Chesterfield says, begged the office, was eventually appointed the Duke of Grafton's successor. Meanwhile a place in the Cabinet had also been offered to Lord Lyttleton and declined; Lord North had refused the appointment of Chancellor of the Exchequer and also that of Vice Treasurer for Ireland; the Presidency of the Board of Trade had been in vain pressed upon Lord Shelburne; his Lordship declined also the appointment of Ambassador to Paris, and both that and the embassy to Madrid were declined by Lord Townshend.

Even the support which the Ministers received in the House of Commons was now become of the most precarious description. In the same letter, from which our last extract was taken, Mr. Conway writes: "Yesterday was expected as a grand day of trial in the House. The American regulations were to be resolved; it was thought and said confidently that Mr. Pitt would second a motion Mr. Beckford was to make for putting the whole off for this year; and many thought we should be run hard, if not beat, on the question. Dowdeswell, who had been quite discouraged by having had of late no support but from the Treasury bench, came and proposed adjourning for a week, till things were settled. I absolutely refused and rejected this, as the most miserable mark of weakness. I went down to the House, the first time I had been there, and found things take quite another turn. The motion was made; but Pitt, instead of supporting, opposed it, and proposed going on upon Monday to hear some more evidence which was desired, and this was so reasonable it was generally accepted, and we had little debate and no division."

Soon after this the Ministers were beaten in the Lords on a measure, the carrying of which they were understood to have much at heart. This was a bill to declare the illegality of general warrants. The subject was first brought before the House of Commons on the 22nd of April, when a resolution condemnatory of general warrants was carried by a majority of 173 to 71. A bill founded upon this resolution was afterwards brought in, and was read a third time and passed on the 14th of May; but having been carried to the Upper House, it was there thrown out.

The last notice of the difficulties of the Ministry, which we find in Mr. Conway's letters, is under the date of the 8th of May. "I am sorry," he writes, "to say our affairs here are not yet settled; I rather hope soon to let you know they are." From this time there is a break in the series of the letters for more than three years.

It is said that the King's displeasure had been strongly excited against the Ministers by an alleged want of alacrity on their part in making application to Parliament for a provision for his younger brothers, the Dukes of York and Gloucester, and Prince Henry Frederick. A royal message was at last brought down to the Commons upon this subject on the 3rd of June, in which his Majesty stated that he had intended to have recommended the making of such provision, but that he should now, in consequence of the advanced season of the year, defer doing so till the next session. On the 6th of the same month Parliament was prorogued.

The Ministry was now like a top which approaches the end of its spinning. Instead of being allowed, however, to drop quietly down, its course was destined to be somewhat rudely stopped. Immediately after the prorogation, the subject of the settlement of a permanent form of government for Canada came before the Cabinet. This occasion was seized by the Chancellor Northington to strike a blow which it is understood he had been for some time meditating. The Ministers having met at his house, his lordship not only objected to the course which they proposed to adopt in regard to the matter before them, but complained that he had been for some time treated with neglect in various instances. The meeting broke up without any resolution having been come to; and the Chancellor then intimated that he should take no farther part in the discussion. Two more consultations, however, took place at the Duke of Richmond's house at Whitehall upon the same subject, and at the last of these it was understood that everything had been satisfactorily arranged; but on the following day the Lord Chancellor went to the King, and having informed his Majesty that it was impossible for the Ministers to retain their situations, declared that he should not attend any more Cabinet meetings, and that he must therefore decline any longer to hold the Great Seal. He at the same time advised that Mr. Pitt should be sent for.

The consequence was, that his lordship was soon after commanded to wait upon that gentleman, and to invite him to form an administration upon his own conditions. On the 12th of July Mr. Pitt had a short audience of the King at Richmond, when his Majesty stated that he had no terms to propose, but should place himself entirely in his hands. Writing to his son on the preceding day, Lord Chesterfield says, "Here are great bustles at Court, and a great change of persons is certainly very near. You will ask me, perhaps, who is to be out and who is to be in? To which I answer, I do not know. My conjecture is, that, be the new settlement what it will, Mr. Pitt will be at the head of it." The writer then intimates that in that case he presumes Mr. Pitt must have relaxed somewhat in the matter of Lord Bute; and he adds, "when that shall come to be known, as known it certainly will soon be, he may bid adieu to his popularity."

On the evening of the day on which he had been with the King, Mr. Pitt had interviews both with Lord Northington and with Mr. Conway, in which the principal arrangements for the new administration were agreed upon. In the meantime it appears that Mr. Pitt had advised that his Majesty should send for Lord Temple, with whom, notwithstanding their recent difference of politics, he continued to maintain his old habits of intercourse and friendship. His proposal was that Lord Temple should be placed at the head of the Treasury, and that his appointment should be communicated to him by the King himself. On the 13th

the Chancellor, by his Majesty's commands, sent for Lord Temple from his seat at Stowe; and on the 15th his lordship came to Richmond, and had an interview with the King, who informed him of what had taken place, and said that he expected his Lordship would assist Mr. Pitt in making the new arrangements.

On the following day, in consequence of a note from Mr. Pitt, Lord Temple came to the house of that gentleman at North End, Hampstead. When his Lordship was now informed that the entire formation of the Ministry had been committed to Mr. Pitt, he at once declined to take any place in the new cabinet, and persisted in his refusal notwithstanding all that Mr. Pitt could urge. They separated in anger, and were not reconciled for some years. Lord Temple professed that his wish was to form an administration which should comprehend men of all parties; the Whigs, the party headed by his brother Mr. Grenville, and even the Tories, one of the most distinguished of whose leaders (Lord Gower) he proposed to make Secretary of State. He said that if he had been first sent for by the King, he should have insisted upon Mr. Pitt being associated in the commission to arrange the new Ministry upon equal terms with himself, and he declared that he thought himself ill-treated by Mr. Pitt not having acted in a similar manner. On the following day he went to the King, and informed his Majesty that Mr. Pitt's terms were such as he could not accede to consistently with his honour; and on the same evening he told Lord Northington that the farce was at an end, and the mask off;—his Lordship, he said, need not have sent for him from the country, for there was no real wish or intention to have him in the administration.

Mr. Pitt now proceeded to complete his arrangements alone. The task which he had undertaken was not accomplished till he had endured several additional severe mortifications. Lord Rockingham considered himself so ill used in the whole transaction, that when the new Premier requested an interview with him, he refused to see him. Having lost also the support upon which he had counted from Lord Grenville, he was obliged, in many respects, to change his original plan, and to look around for assistance to other quarters. His cabinet was thus fated to assume not a little of the composite character which Lord Temple had wished to impart to it; but many of his applications were met by rejections, in some instances not unaccompanied with something of offensive expression, which was provoked by the ungracious haughtiness of the manner in which they were made. He now offered the seals of Secretary of State to Lord Gower, but they were indignantly refused by that nobleman. Lord Scarborough and Mr. Dowdeswell also declined taking office, on the ground of the rude manner, as they conceived, in which they were applied to.

The new cabinet, however, was at length constructed, and the several appointments announced in the Gazette of the 2d of August. Mr. Pitt, created Earl of Chatham, took to himself the Duke of Newcastle's office of Lord Privy Seal. Lord Camden was made Chancellor, in room of the Earl of Northington, who was transferred to the Presidency of the Council. The Earl of Shelburne was appointed one of the Secretaries of State, Mr. Conway continuing in office as the other. The place of First Lord of the Treasury was bestowed upon the Duke of Grafton; and the Honourable Charles Townshend became Chancellor of the Exchequer, it being also arranged that he should henceforward be the ministerial leader in the House of Commons. Sir Charles Saunders succeeded Lord Egmont at the head of the Admiralty; and the Earl of Hillsborough, Lord Dartmouth, as First Lord of Trade. Several changes were also made in the subordinate places of the Treasury and Admiralty Boards. Viscount Barrington was continued as Secretary-at-War; and Lord North and Mr. George Cooke were associated in the office of Paymaster-General, formerly held by Mr. Charles Townshend. In the Household the Duke of Portland was succeeded as Lord Chamberlain by the Earl of Hertford; Lord Edgecumbe as Treasurer, by Mr. John Shelley; and Lord Scarborough as Cofferer, by Mr. Hans Stanley. The Solicitor-General, Mr. William de Grey, became Attorney-General in the room of the Honourable Charles Yorke; and the appointment of Solicitor-General was given to Mr. Edward Willes. The Marquis of Granby was placed at the head of the army.

The displeasure taken by a large portion of the public of these arrangements may be gathered from a letter of Lord Chesterfield's. "The curtain," says his Lordship, writing on the 1st of August, "was at last drawn up, the day before yesterday, and discovered the new actors, together with some of the old ones. I do not name them to you, because to-morrow's 'Gazette' will do it full as well as I could. Mr. Pitt, who had a *carte blanche* given him, named every one of them: but what would you think he named himself for? Lord Privy Seal, and (what will astonish you, as it does every mortal here) Earl of Chatham. The joke here is that he has had *a fall upstairs*, and has done himself so much hurt that he will never be able to stand upon his legs again. Everybody is puzzled how to account for this step; though it would not be the first time that great abilities have been duped by low cunning. But be it what it will he is now certainly only Earl of Chatham, and no longer Mr. Pitt in any respect whatever. Such an event, I believe, was never read nor heard of. To withdraw in the fulness of his power, and in the utmost gratification of his ambition, from the House of Commons (which procured him his power, and which could alone ensure it to him), and to go into that hospital of incurables, the House of Lords, is a measure so unaccountable, that nothing but proof positive could have made me to believe it, but true it is. Lord Shelburne is your Secretary of State; Charles Townshend has now the sole management of the House of Commons; but how long he will be content to be only Lord Chatham's vice-gerent there, is a question which I will not pretend to decide. There is one very bad sign for Lord Chatham in his new dignity, which is, that all his enemies, without exemption, rejoice at it; and all his friends are stupified and dumb-founded. If I mistake not much, he will, in the course of a year, enjoy perfect *otium cum dignitate*."

On the 14th of the same month, we find his Lordship expressing himself again in the same strain:—"It is certain that Mr. Pitt has by, his dignity of Earl, lost the greatest part of his popularity, especially in the city; and I believe the opposition will be very strong, and perhaps prevail next session in the House of Commons; there being now nobody there who can have the authority and ascendant over them that Pitt had."

Thus was broken up the Ministry of the Marquis of Rockingham, after it had lasted just one year and twenty days. A well known summary of their services, shortly after drawn up by Mr. Burke, and published under the title of 'A Short Account of a Short Administration,' thus concluded:—"The removal of that administration from power is not to them premature, since they were in office long enough to accomplish many plans of public utility, and by their perseverance and resolution rendered the way smooth and easy to their successors; having left their King and their country in a much better situation than they found them. By the temper they manifest, they seem to have no other wish than that their successors may do the public as real and as faithful service as they have done." Mr. Burke left town for Ireland immediately after the dismissal of his friends, and remained there till the meeting of Parliament, with the object, as he has himself stated, "to put himself out of the negociations which were then carrying on very eagerly, and through many channels, with the Earl of Chatham." It is understood that he was offered the place of a lord of trade by the new administration, and that Lord Rockingham advised him to accept the appointment.

REPORT OF THE COMMITTEE ON MEDICAL REFORM.

AMONG the Parliamentary papers which have lately been delivered is the Report of the Committee appointed to inquire into, and consider of the laws, regulations, and usages regarding the education and practice of the various branches of the medical profession in the United Kingdom. This is a paper of great interest, not merely to the medical practitioner, but to the public at large. No new arrangements have been recommended by the committee; the extent of the evidence necessary to the completion of the inquiry having obliged them to continue the examination of witnesses until the latest period of the last Session, and "prevented them from giving to the evidence that consideration which is essential to their drawing any such deliberate conclusion therefrom, as they would feel justified in reporting to the House." They therefore have confined themselves to reporting the evidence only, and recommend that the

committee may be re-appointed in the present Session, for the purpose of considering such evidence, and reporting their opinion thereupon to the House. The Report before us consists of two volumes or parts, of which the first contains the evidence relating to the Royal College of Physicians; the second, that relating to the Royal College of Surgeons.

I. The Royal College of Physicians is composed of Fellows, Licentiates, and officers chosen from the Fellows.

These officers are—one president, seven elects, (eight elects); four censors; one registrar; one treasurer; four curators of the Museum, besides the president and the four censors who are curators by virtue of their offices.

The numbers of the several descriptions of members at present, are—

Fellows . .	113,	of whom 60 reside in, or within seven miles of London.
Candidates . .	6	,, 2 ditto.
Inceptor Candidates .	7	,, 3 ditto.
Licentiates . .	274	,, 142 ditto.
	400	207

During a period of 63 years, from 1771 to 1833, inclusive, 168 fellows have been admitted, and four candidates have been rejected; and during a period of 11 years, from 1823 to 1833, inclusive, 126 licentiates have been admitted, and seven candidates rejected.

The licentiates are subjected to as strict a *medical* examination as the fellows; but the invidious distinction still exists, which has so often produced much unpleasant feeling between the two bodies. At present only those physicians who have graduated at Oxford and Cambridge are admitted as fellows. By one of the bye-laws, however, the president is allowed to recommend annually one licentiate of ten years' standing. A bye-law likewise exists, permitting a fellow to propose a licentiate of seven years' standing, and more than 36 years of age, for examination by the college, in order to become a fellow, but this latter privilege appears never to have been acted upon; the attempts that have been made to render it available have always been evaded. In the case of Dr. Stranger, who, nearly 40 years ago, took legal proceedings against the College of Physicians, Mr. Law, (afterwards Lord Ellenborough,) counsel for the plaintiff, made the following observation:—"There has been no person admitted; there have been many trials, but nobody has ever got through that wicket, nor ever will;" and his prophecy appears to have been accomplished, for up to the present time this wicket has never been opened.

How far this exclusive spirit has acted favourably, and how far the graduates of Oxford and Cambridge are better fitted for higher honours than the graduates of other universities, a few extracts from the evidence given will best show. The reason for confining the choice of the electors to the graduates of the two English Universities is thus stated by Sir Henry Halford.

"* * * There is a certain preference of those members in the mind of the fellows of the College; for they are people who have undergone a moral and intellectual trial in the universities from whence they came, to which they are not subject at the foreign universities."—p. 5. "I know those places well, and I know there is an opportunity of undergoing moral discipline, of which the great body who come for a licence have no proofs to give, that they have undergone it. * * * I believe that the physic which they may acquire at Oxford and Cambridge is undervalued by those who reproach the universities for not being schools of physic; but that is of very little importance, if they have their preliminary education. They will go and find physic wherever it is to be found afterwards."—pp. 5, 10.

The medical education of Oxford is measured by duration, not by degree; seven academical years are required to be passed before the student, after first entering, can take his master of arts degree. After an interval of another year, he may obtain his degree of bachelor of medicine, and in three years from that time, the "doctorate" is acquired; it therefore takes eleven complete academical years to become M.D. But according to the practice for many years past, the student is not obliged to attend upon any medical lectures in Oxford; he can attain only the honour there, and must seek the instruction elsewhere. Whether he has obtained the competent knowledge to fit him to become a physician is not made a subject of inquiry; the examination is merely nominal, and he obtains his doctorate because the eleven years are elapsed. No doubt the generality of men who enter a profession in which they can gain eminence only through the exercise of talent and study, will in this interval qualify themselves as much as possible for the station which they wish to occupy; but surely it should be ascertained that they have good claims to the distinction, before it is bestowed. In the examination, before the Committee, of Dr. Kidd, regius professor of physic in the university of Oxford, the following questions and answers occur. "Though no attendance upon medical lectures at Oxford was required, yet were certificates required in proof of those branches of medical study having been pursued in some other school? No: the word of the individual given to the professor, and the knowledge of his habits derivable from the professor's extensive acquaintance, were considered sufficient. * * * In my own case I have relied upon the word of the person, having also collateral testimony from other persons, that he had been employed in studying his profession. * * * Has that (medical exercises, &c.,) been considered as a mere form, or is it intended to be a fair trial of the medical knowledge of the party? For the last half century it has been a mere form. The Syllogisms are merely put *pro formâ?* Quite so. How many acts and opponencies must be kept for the doctorate? None; the candidate must previously read six lectiones in the public schools. Are those lectures matter of form? Yes. Are they all read in one day? In two days I think. Is it usual to compose any lectio really for the occasion; or does any scrap of paper or book read at the time serve the purpose? That entirely depends upon the individual: for nobody is present but himself and the bedel. Does the bedel generally provide the lectio? I am sure I do not know how that is."—pp. 309, 311.

"Before the degree of doctor of medicine is given by the university, means are taken which enable persons acting on behalf of the university to satisfy themselves that the person has competent medical knowledge? Yes. That is not done by examination? No; not by public examination. Is it done by the professor examining the candidate in the various branches of medicine? I apprehend that if the professor had any reason to doubt the proficiency of the individual he would do so. On one occasion I had some reason to doubt, and I made use of my power. In what way did you make use of your power? By actual examination. In what way did you examine the applicant?—Upon the point in which I had reason to suppose he was deficient. What was that? In his knowledge of Greek and Latin. He was a stranger. He came from another university in fact. Was that the only case in which you examined an individual for his degree? It was the only instance in which I thought it necessary to examine an individual for his degree."—p. 318.

The evidence of Dr. Billing, who graduated in Trinity College, Dublin, in the first instance, and subsequently at Oxford, tends to the same point. "I took some oaths of allegiance, and so forth, and then the Vice-Chancellor of the university went through a short form by which I was declared an Oxford doctor of medicine. Has the regulation which requires the graduates of Dublin to go to Oxford or Cambridge before they can obtain admission to the College of Physicians any other effect than that of subjecting the party to expense and inconvenience? Certainly not: it is of no use whatever."—p. 117. It appears that Dr. Billing wished, in the first instance, to be admitted *ad eundem* for a degree of medicine at Cambridge, but his application was refused because he had taken a degree in arts previously to taking his degree in medicine at Dublin. "I had, as they call it, gone out in arts, that is to say, taken the degree of bachelor of arts in Trinity College, Dublin. It would have been a matter of great convenience to me to have gone to Cambridge; and from having friends there I preferred that to Oxford, and applied there first. Who was it that gave you this reason? Dr. Haviland the regius professor. Did he state that it was inconsistent with the statutes of the university, or what reason did he give? That it was inconsistent with the statutes, or contrary to the usage of the university, to admit me a bachelor of medicine, because the university would not permit any of their own members, who had taken the degree of bachelor of arts, subsequently to become bachelor of medicine. It did not at all turn upon the reasonableness of the application? No, it was a mere technical objection. I had taken a degree too much, and, according to the information I re-

ceived, a person who goes out in arts at Cambridge is obliged to pass a much longer time to obtain a degree of doctor of medicine than if he had not gone out in arts; his having acquired additional knowledge compels him to wait a longer time before he can obtain it (the degree). In fact, a person who has taken no degree in arts may become doctor of medicine in his ninth year from matriculation, whereas he who has taken a degree in arts cannot become doctor of medicine until in his fourteenth year."—p. 161. All this is abundantly unreasonable, certainly, but in the main point under consideration, viz., the examination as to medical proficiency, it appears that Cambridge at present leaves Oxford very far behind, and that it is there no longer a mere ceremony. From the evidence of Dr. Elliotson, who went to graduate at Cambridge after he had already been admitted as a licentiate of the College of Physicians in London, and from the evidence of Dr. Burrows, who graduated at Cambridge in 1826, we find that since Dr. Haviland has been appointed regius professor of physic to that university, "the thing has improved exceedingly, and that there is a most respectable examination; such questions as it would be a credit to any man to answer."

To be enabled, however, to pass with credit through an examination under the improved system lately adopted at Cambridge, it is requisite to seek practical knowledge elsewhere. As a school for medicine it is immeasurably inferior to those of London, the students of which are altogether excluded from admittance even among the licentiates of the College, unless they have also passed two years of study at Edinburgh, Dublin, or some foreign university.

The licentiates naturally feel it to be a grievance that, being equally well educated, they cannot attain to the same honours as the fellows; especially as their exclusion is considered by many to be "totally inconsistent with the charter of the College, and no ground can be perceived for its adoption on any principle that would be considered professionally equitable." The only argument brought forward in favour of this distinction is the superiority of the preliminary education at the two universities.

This preliminary education, however, on which so much stress is laid, is reluctantly admitted by its advocates to be no very high qualification. "I acknowledge," says Dr. Paris, "that a person may pass through examinations and obtain a degree with a very moderate quantity of knowledge."—p 180. As to the moral discipline, it is observed in another part of the evidence, "Knowledge, I think, is equally valuable, whether it is acquired in one place or another; and I do not see any ground for its being considered that morality and good conduct are confined to Oxford and Cambridge. It is not generally supposed that those are the best soils for the culture of such qualities."—p. 238.

The medical examinations which a candidate must undergo before being admitted a fellow, are exactly the same as those which a licentiate is obliged to pass through, with this only difference, that the first is required to have a knowledge of Greek as well as of Latin; in which latter language the examination is always conducted. Dr. Elliotson was asked,—"After taking your degree at Cambridge, and then applying to be admitted into the order of Candidates of the College of Physicians, were you required to undergo another examination? Just the same as if I had never been to the College before. The only difference was that on the first examinations they put Celsus and Sydenham before me to construe; in the examinations for the candidateship, they put Hippocrates and Aretæus. How long did your first examination for the licentiateship last? The examination usually lasts about twenty minutes, I think; sometimes longer. * * It is not a very extensive or profound examination. * *. There is no great examination; nothing worth the name in chemistry or botany."—p. 105.

"Do you consider those examinations a sufficient test of medical fitness? A very imperfect test. * * The examination was very limited or partial; the time was so short that only a few subjects could be touched upon. There is much of chance in such examinations." [Dr. Arnott. p. 154.]

"The examination by the College of Physicians was no test at all; the three examinations did not last above twenty-eight minutes altogether." [Dr. Johnson, p. 236.]

"Do you think it possible for a person ignorant of the subject on which he is examined to pass an examination before the College of Physicians? I think a man may pass an examination at the College of Physicians who is a good classical scholar, but knows nothing of chemistry, nothing of medical jurisprudence, nothing of surgery, little or nothing of anatomy, nothing of the diseases of women in childbed, and nothing of the manner of delivering them. I think a man with all those items of knowledge wanting might pass the examination for licentiate, and therefore for fellow, as the medical examinations for both are allowed to be identical. What opinion have you of the fitness of conducting the examination at the College of Physicians in Latin? I think it exceedingly injurious, for it narrows the field of knowledge both of the questioner and the examined. That is supposing that the examiner could not speak Latin correctly? I say that it narrows the ground of the examination, because I know of no man either in or out of the College of Physicians who speaks Latin as well as he does English. If the party examined were a fluent speaker of classical Latin, do not you think that he would thence derive assistance in concealing his comparative ignorance of the medical subject on which he was examined? No doubt he would; and a man ignorant of Latin would derive a similar cloak to conceal his ignorance, because he would get credit for knowing his subject and for being able to answer if he might only dare to speak English." [Sir David Barry, p. 166.]

"May not an examination in Latin of the candidates for a degree or license have the effect of concealing from the examiner the real state of the knowledge of the person examined? I think the practice exceedingly objectionable, for several reasons; one of them is implied in the question. Then there are persons who, judging aright of the importance of that study, have not chosen to waste their time upon it, but have been labouring to acquire positive knowledge of medical matters; and the consequence in some cases has been, that in the examination before the College, their slight literary deficiency has been allowed to bring disgrace upon them, and the great amount of their medical attainments has not availed them. A person speaking, for instance, very pure Latinity, but having a very moderate knowledge of the medical subject on which he was examined, might perhaps pass with greater eclat than a person having less classical knowledge of the language, but a much greater knowledge of the branches of medical science? I think he might; I am afraid that that comparatively unimportant qualification would weigh in many cases, and be more important in the result of the examination than the professional knowledge of the individual." [Dr. Arnott, p. 160.]

II. The Royal College of Surgeons requires that the candidates for a diploma must be at least twenty-two years of age; must have been engaged five years in the acquisition of professional knowledge; have studied anatomy by attendance on lectures and demonstrations, and by dissections, during two anatomical seasons, extending from October to April inclusive, comprising at least 140 lectures on anatomy, occupying not less than one hour each, given on separate days; and 100 demonstrations of the like duration, given in a similar manner, exclusive of dissections, of which distinct certificates are required. They must likewise have attended two courses of lectures on surgery, each course comprising not less than sixty lectures; and lectures on the practice of physic, on chemistry, and on midwifery, during six months; and on botany and materia medica during three months. They must also have attended during twelve months the surgical practice of a recognised hospital in London, Dublin, Edinburgh, Glasgow, or Aberdeen; or for six months in any one of such hospitals, and twelve months in any properly-constituted provincial hospital, acknowledged by the council as competent for the purposes of instruction. The council consists of twenty-one members. The number of the members of the College is at present 8536; of these there appear to be resident in

London, and within three miles thereof	1206
Bath	70
Birmingham	74
Bristol	101

The number of members residing in London and practising surgery only, may be estimated at 100; and those residing in the country and practising surgery only, may be estimated at about the same number. These members only are eligible to be elected to the council; those who practice pharmacy or midwifery are not admitted, on the ground that the general practitioner cannot give up his time and attention so exclusively to surgery, as is required to gain pre-eminence in that branch of his profession. This reason is, however, by no means satisfactory to the whole of the profession. "Considering that by far the greater number of the members are general practitioners, is it a reasonable bye-law which excludes them wholly from any participation in the government of their own college, and limits the government to those exclusively who confine, or are reported to confine their practice to surgery? No; I do not consider it reasonable. Has it given rise to any dissatisfaction? Great dissatisfaction. Ought the practice of pharmacy to be a ground of exclusion? I think it exceedingly cruel and improper. There are some of the most eminent men that this country has produced, who at one time or another had some dealings in pharmacy. * * * Ought the practice of midwifery to be a ground of exclusion?—Far less so."—[J. Wardrop, Esq. p. 171. Part ii.]

The number of candidates for the diploma of the College examined during eleven years, from 1823 to 1833, both inclusive, was 4305 approved, and 316 rejected. It appears from the evidence of Mr. John Scott and others, that the examinations are now much more strict and extensive than they were a few years ago: the proportion however of rejected candidates is less in the latter years. In 1823 the rejections were 1 in 10, and in 1833, 1 in 14. But although great improvements have been made in the education of medical students of the present day, it is considered that there is still much more to be done. The various opinions on this subject, of the most eminent members of the profession are contained in these volumes, but it is a matter of no small difficulty, amid such a mass of valuable evidence, to select that which possesses the greatest interest. We subjoin some of Dr. Arnott's remarks on the subject.

"What is the course of education which you think persons intending to practise medicine or surgery should undergo?—I think they should receive a complete general education, as well as what is more strictly technical; for the living human individual being made up of parts and functions, which are *mechanical*, or *chemical*, or *vital*, or *mental*, and the causes of disease, as well as all the remedies, belonging to the same four classes, which constitute the whole of human science, it is essential that the medical student should obtain considerable acquaintance with all of them, and therefore as preliminary studies should apply to 1st. physics, or natural philosophy; 2nd. chemistry; 3rd. physiology, or the philosophy of life, as deduced from examination of the animal and vegetable kingdoms; and 4th. psychology, or the philosophy of mind; these four departments, I think, are essential as preliminary studies. The time for the acquisition of those four departments, if well taught, and in the degrees in which it would be necessary for a medical man to acquire them, would not be very great. A portion of the time now wasted on the ill-ordered study of the Greek and Latin classics would suffice for this purpose. . . . . Would you require a knowledge of the learned languages?—To a certain extent. It was a saying of Milton, that in one year, by a better mode of study, the young men of this country might learn more of Greek and Latin, than they did in seven years by the mode of study that prevailed in his day. I believe this, and that the system has not been at all improved since Milton's day, at least in the public schools and universites. . . . The day was, when in Europe no good book existed upon medical or other science, which was not written in Greek or Latin. At that time, therefore, those languages were the keys to all knowledge; now, however, we have much better books upon every scientific subject, with the single exception, perhaps, of Euclid's geometry, in modern languages; and a man who should pretend to study science in a Greek or Latin author, would be wasting his time; he could be preferring to learn, first from a person who would give him only half information, and who held many false opinions, on something which it was of great importance to him to know truly; he would have great difficulty afterwards in rectifying his first erroneous impressions. I believe therefore that medical science particularly should be studied in the modern languages, and that it can be merely a satisfaction to men of leisure, while studying the history of the science, to know what was thought upon various subjects in former times."

The practice of requiring a five years' apprenticeship to an apothecary is strongly reprobated by several of the witnesses: this period is generally from sixteen to twenty-one years of age, the very best years of a man's educational life; he cannot consequently have acquired a proper preliminary education. "And then they crowd all the studies necessary for a physician, a surgeon, an accoucheur, and an apothecary, into two years, and have only one examination on the whole of these."

Mr. Guthrie furnishes the following amusing evidence on the subject:—

. . . "A student of my own came to me two years ago, and said, 'I have settled myself in the city.' I said, 'I hope you will succeed.' 'Yes,' said he, 'I have nothing to do at present, but I hope I soon shall; but I want an apprentice.' So I said, 'What do you want with an apprentice if you have got nothing to do yourself?' 'But I *may* have,' he replied, 'and then I should want somebody to answer the door, and receive messages that may be sent to me, and if I have anything to do, to make up medicines; and in fact to answer any purposes which may be desired of him.' Now this is the case in the country; and as it is imperative upon a gentleman to have somebody in his house, he is willing to take a boy upon the most moderate terms. There are always in every village, persons in such a situation of life, that they can afford to pay a moderate fee with a son, although they are not competent to give him that preliminary education which would qualify him to take a proper and respectable place in his profession. A surgeon, therefore, takes the boy for a small fee, who does all sorts of work, but learns comparatively very little. At the end of his apprenticeship, or at the end of five years, he comes up to London, or goes to Edinburgh, for those two years of study which are required of him by the College. He then returns, being now made a qualified practitioner. But this is not the sole misfortune. The original gentleman having got a little more practice, takes a second and a third, and great is the manufacture in this way of young doctors, who are for the most part, in regard to their preliminary education, unqualified people."

It was our intention to notice some of the suggestions contained in the evidence as to how the education of medical students might be improved, and the observations made by various gentlemen who were examined by the committee as to the most efficient manner of ascertaining the degree of knowledge of those students before they are permitted to practise; but we have already exceeded our limits, and can only find space for one or two short extracts on the question of remunerating apothecaries.

"Do you approve of the practice of paying apothecaries by the amount of their bills for medicines?"—"No, I set my face very much against that; I had rather they were paid for their trouble, for every apothecary who enters a house, enters it with that mark upon his forehead. You are to take as much medicine as I can get you to take, and that procured by me at as cheap a rate as I can procure it. It is a bad system only to be paid according to the proportion of physic they can get a person to take."—[Sir H. Halford, p. 19.]

"Does the charge for medicine lead to a complex system of prescription?—I think it leads to the patients being obliged to take drugs that are either unnecessary or improper, and it is not unfrequent, I believe, for the apothecary by that means to be paid more for his visit than the very highest physician. For, at the visit he makes on one day, he says to his patient, 'I shall send you draughts and pills till this day week or fortnight.' He continues to do so. By the time he arrives at his next visit, the pills and draughts have amounted to such a sum as would come to more than one or two fees of a physician."—[Sir David Barry, p. 173.]

"The general practitioner is, in most cases, under the necessity of charging for medicines in order to remunerate himself; and it is said by some malicious people, that he makes his patients swallow three times as much medicine as they ought to do, and as they otherwise would do, in order that he may be reasonably and properly remunerated. Some people it is true throw it away; but still they pay for it; and some very good people swallow it, thinking they are doing that which is right. Now, I do not mean to say that this is true; but I will tell the committee a fact, so far as regards myself. I have been called in with a general practitioner to see a patient, and it has happened that he says to me, 'Sir, are you going to order that person a pill?' 'Yes, Sir, I hate physic myself, and I never take any, and I am going to give him the least possible quantity.' 'Yes, Sir,' says he, 'that is all very well for you, but it is not very well for me. This gentleman is a very parsimonious person, and he will give me but twopence for the pill, and in addition to having me here now, he will probably have me here again in the morning, to know the effect of it.' 'Well,' I say, 'what is to be done?' He says, 'at all events put it into a bottle.' Well, I cannot refuse such a request, so I generally accede to the apothecary in attendance giving the medicine in such manner as he pleases, provided he gives only the proper dose. He may give it in two draughts instead of one. Now, this is not making a person swallow any greater quantity of medicine, but it is an inconvenience, and therefore I am very desirous that that way of remunerating the general practitioner should be done away with."—[Mr. Guthrie, p. 29.]

PARLIAMENTARY ABSTRACTS.

[We have been obliged to displace a considerable quantity of matter coming under this head after it was in type, and to reserve it till our next Number, in consequence of the space occupied by our abstract of the Corporation Report, which, from the importance of the subject, and the interest generally felt respecting it, it was thought desirable to make as complete as possible.]

TRADE, STATISTICS, &c.

London.—The total number of persons charged at the Police Stations during the year were, 64,269; consisting of 41,686 males, and 22,583 females; being a diminution in the number of persons charged of 5,690 less than during the year 1833, and 13,274 less than during the year 1832, which charges were disposed of as follows:—

Committed for trial by the magistrates .	3,468
Summarily convicted or held to bail by ditto	26,302
Discharged by ditto	34,499

Education in the United States.—There are 59 colleges in the United States, of which 12 are in the New England States, 13 in the Middle States, 15 in the Southern States, and 19 in the Western States and Territories: 22 theological institutions; 18 medical schools; 4 law schools; the number of instructors is 400, and the number of students 6700.

Education in Paris.—The following is the number of institutions for 1834, beginning with the lowest class, and closing with the colleges attached to the University of Paris:—

Asylums, 19; number of children received, 3500.

Schools for children maintained by the city of Paris, 49; number maintained by the hospitals, 71; total, 120; number of pupils, 25,035.

Adult schools maintained by the city of Paris, 19; and by the hospitals, 7; total, 26; number of pupils, 1898.

Independently of these establishments, the authorities have founded 29 schools of industry, in which 1595 girls, between the ages of twelve and fifteen, are taught to work at the needle.

The colleges are 7 in number, attended by 4932 pupils, of whom 1873 are boarded and lodged in the colleges, and 3059 are day scholars. The whole number of these establishments is 172, and that of the individuals attending them 36,960.

The budget of the minister of public instruction for the year ending 1836, includes the same items of expenditure as those for 1835, which amounted to 12,291,629 francs, or about 491,665*l*. There is an addition to the budget for the former year of 28,000*l*. (700,000 fr.), which are applicable to the purposes of national education. In all other respects the budgets for the two years are precisely similar. It appears by a report to the king, which is attached to the present budget, that the minister is desirous of a grant of 6000*l*. (150,000 fr.) towards the establishment of district colleges; but the legislature declined to vote this sum until they have first decided upon the system to be pursued with regard to the class of secondary instruction.

University of Paris.—The present number of students registered in the faculty of medicine is 4500, and in that of jurisprudence upwards of 5000. The polytechnic school has 302 pupils.

Other Miscellaneous petitions	47	3,062

NEW MEMBERS.

Sir John Elley, knt., for Windsor, in the room of Sir John Edmond de Beauvoir, unseated by the decision of a select committee

Henry Gally Knight, Esq., for the northern division of Nottinghamshire, in the room of Lord Lumley, called up to the House of Lords by the death of his father, the Earl of Scarborough.

Daniel Callaghan and Herbert Baldwin, Esquires, for the city of Cork, in the room of Joseph Leycester, Esq., and Lieut.-Colonel James Charles Chatterton, unseated by the decision of a select committee.

NEW WRITS ISSUED.

For Drogheda, in the room of Andrew Carew O'Dwyer, Esq., whose election has been determined to be void, on account of an informality.

For the northern division of Essex, in the room of the Right Hon. Alexander Baring, now Lord Ashburton, called up to the House of Lords.

For the southern division of Devon, in the room of Lord John Russell, Secretary of State.

Cambridge Borough—Right Hon. T. Spring Rice, Chancellor of the Exchequer.

Northumberland, northern division—Lord Viscount Howick, Secretary at War.

Nottingham borough—Sir J. C. Hobhouse, bart., President of the Board of Control.

Manchester—Right Hon. C. P. Thompson, Vice-President of the Board of Trade.

Edinburgh—Sir John Campbell, Attorney-General.

Penryn and Falmouth—R. M. Rolfe, Esq., Solicitor-General.

Kirkcudbright—Right Hon. R. C. Ferguson, Judge-Advocate General.

Totness—Right Hon. Lord Seymour, Commissioner of the Treasury.

Newport, Isle of Wight—W. H. Ord, Esq., Commissioner of the Treasury.

Elgin Burghs—A. L. Hay, Esq., Clerk of the Ordnance.

Stirling Burghs—Lord Dalmeny, Lord of the Admiralty.

Leith—J. A. Murray, Esq., Lord Advocate for Scotland.

Dundee—Right Hon. Sir Henry Parnell, bart., Treasurer of the Navy and Paymaster of the Forces.

Cashell—Louis Perrin, Esq., Attorney-General for Ireland.

Dungarvon—Mich. O'Loughlin, Esq., Solicitor-General for Ireland.

Clackmannan and Kinross—Admiral Adam, Lord of the Admiralty.

Invernesshire—Right Hon. Charles Grant, Secretary of State.

Yorkshire, west riding—Lord Viscount Morpeth.

Taunton—Henry Labouchere, Esq., Vice-President of Privy Council for Trade, and Master of the Mint.

Haddington Burghs—Robert Stewart, Esq., Commissioner of the Treasury.

Berwick-upon-Tweed—Sir Rufane Shaw Donkin, Surveyor-General of the Ordnance.

Sandwich, &c.—Sir Thomas Troubridge, Commissioner of the Admiralty.

Bankruptcy Analysis from March 24 to April 24.

Auctioneer, 1; baker, 1; blind-maker, 1; blacksmith, 1; brewers, 2; booksellers, 3; builder, 1; cattle salesman, 2; chemists, 2; cloth-manufacturer, 1; commission-agent, 1; corn-factor, 1; cotton-spinner, 1; drapers, 4; druggists, 2; farmer, 1; fishmonger, 1; flax-dresser, 1; glass-merchant, 1; granary-keeper, 1; grocers, 4; hatter, 1; horse dealers, 2; innkeepers, 2; ironmongers, 3; laceman, 1; leather-seller, 1; livery-stable keeper, 1; lodging-house keepers, 2; mercer, 1; merchants, 11; money-scriveners, 2; nursery-man, 1; plumber, 1; paper-hanger, 1; publican, 1; ribbon-manufacturer, 1; scrivener, 1; straw-hat manufacturer, 1; tailors, 3; teasel-dealer, 1; tea-dealer, 1; tin-plate worker, 1; tobacconist, 1; victuallers, 5; wheelwright, 1; wine-merchants, 3; upholsterer, 1; total, 84; total from the commencement of the year, 365.

POLITICAL RETROSPECT FOR APRIL, 1835.

GREAT BRITAIN.

The period over which our present review extends has again been an eventful one in our domestic politics.

On Monday the 23d of March, in the House of Lords, Lord Brougham presented a petition numerously signed by inhabitants of the City of London, in favour of the abolition of the stamp duty on newspapers; and in doing so, took occasion to address their Lordships, at considerable length, in support of the views of the petitioners. No observations upon the subject, however, were made by any of the ministers.

In the Commons, this evening, an altercation arose on a petition from the agent to the petitioners against the return of Mr. Bridgman for Ennis, praying to be allowed to amend the description of one of the sureties, who had been rejected in consequence of the number of his residence having been incorrectly stated. The misstatement appearing clearly to have been merely a clerical error, it was at last agreed to grant the prayer of the petition.

Mr. Roebuck then called the attention of the House to a letter which had been written by Sir Robert Peel to Mr. Hume, calling upon that gentleman for an explanation of

some expressions he had used in a late debate; and moved that the said letter was a breach of privilege; but after a few remarks from Sir Robert Peel and other members, the motion was withdrawn.

The report of the Committee of the whole House on Irish tithes was afterwards brought up, and the Bill embodying the resolutions which had been agreed to, was read a first time. The bill, as now introduced, did not contain the enactments respecting the million loan which it had been originally proposed should form part of it; but Sir Robert Peel intimated that he would move their insertion when the measure had advanced to a subsequent stage. In the course of a conversation which arose upon this subject, much heat was excited by a speech delivered by Mr. Barron, in which he denounced what he described as the inconsistency and abandonment of principle that had been exhibited by Sir Robert Peel and his colleagues, and charged them with being actuated merely by a base desire of office. For these expressions the honourable Member was directed by the Speaker to apologize to the House, which he did.

Mr. Finn then brought forward his motion for the appointment of a select committee to inquire into the nature, extent, and tendency of Orange lodges; which was agreed to without a division. It gave rise, however, to a debate of some length, the most remarkable passage in which was a singularly precipitate and unjustifiable attack on Mr. Ward by Lord Mahon; for which his lordship was eventually glad to plead in excuse the momentary excitement under which he had spoken.

It was this night stated by Sir Robert Peel, in answer to a question, that Viscount Canterbury, who had been nominated commissioner to Canada, had given up the appointment in consequence of the illness of a member of his family.

On Tuesday the 24th, in the House of Lords, on the motion of the Duke of Richmond, a select committee was appointed to consider the subject of prison discipline in the gaols of England and Wales.

In the Commons, Sir Edward Codrington complained of an alleged misrepresentation of something he had said in the House by 'The Morning Post;' on which Lord John Russell intimated that he should probably make the matter the subject of a motion on the following day. His Lordship, however, afterwards abandoned this intention at the request of the gallant admiral.

The House having then resolved itself into Committee, Sir Robert Peel brought forward his plan for effecting a commutation of tithes in England, by voluntary agreement, in the case of each parish, between the owner and payers of the tithe. After a short debate, a resolution, embodying the leading principle of the plan, was agreed to. The latter part of the evening was taken up in discussing the conduct of Colonel Tremenheere, commanding-officer of the Marine Barracks at Chatham, who was charged with having unconstitutionally used the authority and powers of his office for electioneering purposes. Mr. Law Hodges moved for a select committee to inquire into this charge; and the motion, although opposed by Ministers, was carried, on a division, by a majority of 163 to 132.

On the 25th, the House having resolved itself into a committee of supply, various sums were voted for the half-pay of officers in the navy and marines, for military pensions and allowances, and for civil pensions.

The second reading of Mr. Poulter's bill for preventing the sale of commodities on Sunday, was then, after some debate, carried by a majority of 121 to 45. Various other bills were also advanced a stage; and the Report of the committee on English tithes was brought up, and the Bill recommended in Sir Robert Peel's resolution ordered to be brought in.

On the 26th, a debate arose on a petition presented by the agent for the petitioners against the return of Mr. Sergeant Goulburn for Leicester, praying to be allowed to alter the name of one of the sureties, which by a clerical error had been given in as Samuel Stokes instead of Thomas Stokes. Although it was urged that to comply with this prayer would deprive the opposite party of the time to which they were legally entitled for inquiry into the responsibility of the sureties, the motion of Mr. Gisborne, that the name should be allowed to be altered, was carried by a majority of 138 to 129. Immediately after this, 103 members voted against correcting an error of a similar description in the name of one of the sureties to the petition against the return of the members for Cork, although in this case the objection to the alteration that had been urged in the former case did not exist. The motion of Mr. Lefroy, however, that the correction should be allowed to be made, was carried by a majority of 27. A few days afterwards, also, the decision in the case of the Leicester petition was reversed, and the order for taking the petition into consideration discharged, on the motion of Mr. Gladstone, which was carried by a majority of 216 against 200.

After these election matters had been disposed of, on the evening of the 26th, Mr. Tooke moved that an address should be presented to the Crown to grant a charter of incorporation to the University of London; and, after a debate of some length, the motion was carried against the opposition of ministers by a majority of 246 to 110. The address having been accordingly presented, an answer was, in the course of a few days, returned by his Majesty, stating that it had been laid before the Privy Council, and that his Majesty would, without delay, call upon the Council for the report of the proceedings had before them on the subject, in order that he might thereby be enabled to judge of the best means of carrying the wishes of his faithful Commons into effect.

On Friday, the 27th, Mr. Herries having moved that the House should resolve itself into a Committee of Supply for the purpose of voting the Army and Ordnance Estimates, Mr. Hume moved that these Estimates should be referred to a Select Committee. After a debate of some length, however, the Honourable Member withdrew his motion, giving notice that he would bring forward a similar one on a future day; and the Speaker having left the Chair, Mr. Herries proposed that 81,271 men should be voted for the service of the year. Major Beauclerk moved that the number should be reduced to 75,000; but this amendment was negatived by a majority of 255 to 101. It was then moved that the sum of 2,978,528*l.* should be granted for the pay of the land forces; and this motion was also carried by a majority of 229 against 57; the latter number of votes being given in favour of an amendment proposed by Lord Albert Conyngham, to reduce the amount of the grant by 6902*l.*, being the excess in the expense of the Life-Guards over that of the Horse-Guards. On the next resolution, that the sum of 78,434*l.* should be granted for allowances to the officers of several public departments connected with the army, Mr. Hume moved that the amount should be reduced by 11,980*l.*, being the expense of the Adjutant and Quarter-Master-General's Offices; but the resolution was carried by a majority of 196 to 43.

On Monday, the 30th, after the House had been called over, Lord John Russell brought forward his motion on the Irish Church in the form of a resolution,—"That the House should resolve itself into a Committee of the whole House to consider of the temporalities of the Church of Ireland." The motion was met by Sir Edward Knatchbull with a direct negative; and a debate ensued, which was continued by adjournments over the three following nights. The speakers in favour of the resolution were, Mr. Ward, Lord Howick, Mr. Sheil, Mr. Charles Wood, Mr. Poulter, Mr. Feargus O'Connor, Sir John Hobhouse, Mr. Sergeant Talfourd, Dr. Lushington, Mr. Littleton, Mr. Spring Rice, Sir John Campbell, Mr. Sergeant Wilde, Mr. Fowell Buxton, Lord Clements, and Mr. O'Connell. Those on the other side were, Sir James Graham, Dr. Lefroy, Colonel Damer, Sir Robert Inglis, Mr. W. E. Gladstone, Sir William Follett, Mr. Praed, Mr. Beilby Thompson, Sir Henry Hardinge, Lord Stanley, Mr. Richards, Mr. Goulburn, Mr. Horace Twiss, Mr. Borthwick, and Sir Robert Peel. At length, after Lord John Russell had shortly replied, the House divided at nearly three o'clock on the morning of Friday, the 4th of April, when the numbers were found to be—for the motion, 322; against it, 289.

On the evening of the 4th the House went into Committee on the motion of Lord John Russell, when his Lordship moved, "That it is the opinion of this Committee that any surplus which may remain, after fully providing for the spiritual instruction of the members of the established church in Ireland, ought to be applied to the general education of all classes of Christians." After the debate had

proceeded for some time, Mr. Borthwick moved an adjournment, but the motion was negatived by a majority of 178 to 140. Soon after, however, the House adjourned till Monday, the 6th.

On that day, the debate having been resumed, the Committee at length divided, when the Resolution was carried by a majority of 262 against 237. After this the House went into Committee on the Navy Estimates.

On Tuesday the Report of the Committee on the Irish Church was brought up, when Lord John Russell rose and moved, "That it is the opinion of this House that no measure upon the subject of tithes in Ireland can lead to a satisfactory and final adjustment which does not embody the principle contained in the foregoing Resolution." Another long debate followed; on the termination of which, at one o'clock in the morning, the House divided, when the numbers appeared to be—for the motion, 285; against it, 258.

On Wednesday, the 8th, the Duke of Wellington in the House of Lords, and Sir Robert Peel in the Commons, announced that the Administration was dissolved.

Both Houses met again on Thursday and Friday, and the House of Lords also on Saturday; but no business of importance was transacted in either. They also both reassembled on Monday, the 13th, when the House of Commons adjourned till Thursday, the 16th, as the Lords did also on the following day. On Thursday both Houses once more adjourned till Saturday, the 18th, Sir Robert Peel stating in the Commons that he had received a communication from his Majesty, informing him that the arrangements for forming a Government could not be completed till then.

On that day Lord Melbourne announced in the House of Lords that he had been appointed First Lord of the Treasury, and that the new Administration was formed. To a question asked by Lord Alvanley, he replied that he did not know whether he should have the assistance of Mr. O'Connell or not, but that he had taken no means to secure it, and had entered into no terms whatever with that Honourable and Learned Gentleman. His Lordship added, that to Mr. O'Connell's opinions in favour of the repeal of the Union and the abolition of the House of Peers, he was entirely opposed. The House then adjourned till the 30th of April, but on the understanding that no public business should be taken till the 12th of May.

The same evening, in the House of Commons, Mr. Francis Baring moved for new writs on account of vacancies occasioned by the appointment of seventeen Members to offices under the Crown. The House then adjourned till the 12th of May.

We subjoin a list of the new Ministry; giving the names, as nearly as possible, in the same order in which we gave those of the late Administration in our Number for January.

The following form the Cabinet:—

Viscount Melbourne, *First Lord of the Treasury.*
Lord Palmerston, *Secretary for Foreign Affairs.*
Lord John Russell, *Secretary for the Home Department.*
Mr. Charles Grant, *Secretary for the Colonies.*
Marquis of Lansdowne, *President of the Council.*
Lord Duncannon, *Lord Privy Seal, and Chief Commissioner of Woods and Forests.*
Lord Auckland, *First Lord of the Admiralty.*
Sir John Hobhouse, *President of the Board of Control.*
Mr. Poulett Thomson, *President of the Board of Trade.*
Lord Howick, *Secretary at War.*
Lord Holland, *Chancellor of the Duchy of Lancaster.*
Mr. Spring Rice, *Chancellor of the Exchequer.*

The other appointments are:—

Sir Henry Parnell, *Paymaster of the Forces and Treasurer of the Navy.*
Lord Morpeth, *Irish Secretary.*
Marquis of Conyngham, *Postmaster-General.*
Mr. Charles Wood, *Secretary to the Admiralty.*
Lord Dalmeny, Admiral Adam, Admiral Sir W. Parker, and Captain Elliott, *Junior Lords of the Admiralty.*
Lord Seymour, Mr. W. H. Ord, Mr. Robert Stewart, *Lords of the Treasury.*
Mr. Francis T. Baring, Mr. E. J. Stanley, *Joint Secretaries of the Treasury.*
Mr. Robert Gordon, Mr. Vernon Smith, *Joint Secretaries to the Board of Control.*
Sir Rufane Donkin, *Surveyor-General of the Ordnance.*
Colonel Leith Hay, *Clerk of the Ordnance.*
Colonel Anson, *Storekeeper of the Ordnance.*
Sir George Grey, *Under Secretary of the Colonies.*
Lord Fordwich, *Under Foreign Secretary.*
Earl of Mulgrave, *Lord Lieutenant of Ireland.*
Mr. Fox Maule, *Under Secretary for the Home Department.*
Mr. Labouchere, *Vice-President of the Board of Trade and Master of the Mint.*

The following are the new appointments to places in the Household:—

Marquis Wellesley, *Lord Chamberlain.*
Lord Albert Conyngham, *Vice-Chamberlain.*
Duke of Argyll, *Lord Steward.*
Earl of Albemarle, *Master of the Horse.*
Earl of Errol, *Master of the Buckhounds.*
Earl of Gosford, *Captain of the Yeoman Guard.*

The following legal appointments have also been made:—

Sir John Campbell, *Attorney-General.*
Mr. R. M. Rolfe, *Solicitor-General.*
Mr. Cutlar Fergusson, *Judge-Advocate.*
Mr. J. A. Murray, *Lord Advocate for Scotland.*
Mr. Cunninghame, *Solicitor-General for Scotland.*
Lord Plunket, *Lord Chancellor of Ireland.*
Mr. Serjeant Perrin, *Attorney-General for Ireland.*
Mr. Michael O'Loughlin, *Solicitor-General for Ireland.*

The great Seal of England has in the meantime been put in commission. The commissioners are Sir Charles Pepys, Master of the Rolls; Sir Lancelot Shadwell, Vice-Chancellor; and Mr. Justice Bosanquet.

FRANCE.

At the end of the month of March, considerable sensation was occasioned by a speech from M. Thiers, the minister of the Interior, who demanded an additional grant of 1,265,000 francs for secret service money. This sum added to those already voted under the same head, made a total of about 100,000*l.* The minister, who declared that if the vote was refused he would resign, justified his demand on the ground of the turbulence and plotting spirit of parts of the nation. He stated that France, since the revolution of July, 1830, had undoubtedly prospered in all her material interests, but that 'nevertheless, factions, though defeated, had lost nothing of their audacity - their designs had been baffled, but they still acted secretly—they combated in the dark—they agitated the country by means of the public press—they worked upon the passions of the misguided and too often distressed working classes—they endeavoured, but happily in vain, to seduce the army from its duty,—and, consequently, the task of government was by no means at an end. The political associations, which before the promulgation of the law against them had met openly, were now forced to seek concealment in order to act with comparative security against the government and against society; but for that very reason it was more difficult than ever to guard against their projects; the enemy, though put to flight, still endeavoured to rally, and it was necessary to prevent the attempt from being crowned with success.' The vote was considered as one of confidence in the ministry, and seems to have passed the Chamber of Deputies with little difficulty.

Some anxiety was felt as to the safe or tranquil transfer of the political prisoners from Lyons to Paris, and for two or three days the telegraphs were worked with singular activity. As these prisoners approached the capital, the streets of Paris were strongly guarded both by troops of the line and National Guards; they were, however, safely lodged in the Conciergerie on the evening of the 27th of March, without any riot on the part of the republicans.

A committee of the Chamber of Peers has recommended an amnesty, but the king is as determined as ever to follow up the prosecution. A certain number of peers have been summoned for the 4th of May to prepare matters for the trial of these men, who have already been more than twelve months in confinement. Some government ordinances regulating, and, to a certain extent, limiting the rights and duties of the French bar, in their pleadings and practice before the Chamber of Peers, have caused considerable discontent, and arrayed a host of lawyers against Louis Philippe and his ministers. Several meetings have been held, and a strong protest against the said ordinances has been numerously signed by the members of the bar. The quarrel is not yet finished, and we are

afraid it may become so serious as to force us to return to the subject next month.

A project of law, to define and fix ministerial responsibility, has been debated with much energy; but the great business has been the American question, which, for many days, exclusively occupied the Chamber of Deputies. The report of the committee was presented on the 28th of March, when the reading of it occupied an hour and a half. It recommended that the full sum of 25,000,000 francs should be paid to the United States as agreed upon in the treaty of 1831, signed by the Duke de Broglie and General Sebastiani; but that, at the same time, care should be taken to preserve the national dignity, and to induce President Jackson to apologise for his threats, or the violence of his language towards the French. A very animated debate followed on the simple question of when the day should be fixed for taking the report into consideration, which finally ended in naming the 7th of April. From what passed on this occasion, one might have thought it doubtful whether ministers would be successful in carrying the measure through the House; but we have had occasion, more than once, to mention the impossibility of foreseeing how the Chamber of Deputies will vote on any question.

On the 6th of April, the American Commodore Elliot, in the 'Constitution' frigate, arrived at Havre, whence he proceeded by land to Paris, his instructions being to wait the decision of the Chambers, and to convey Mr. Livingstone, the ambassador, back to America, in case the claims should be rejected. The commodore reached the French capital time enough to be present at all the debates, which, we should think, must have both amused and astonished the worthy sailor. The discussion did not fairly begin until Thursday the 9th of April. It closed on Saturday the 18th, when notwithstanding various intemperate speeches, and some of the strangest reasoning we ever heard of, the payment of the whole of the United States' indemnity was carried by the unexpected and enormous majority of 289 against 137. An amendment, however, proposed by General Valezé,—that no instalment should be paid to the Americans until their President gave satisfactory explanations to the French government as to the proud and warlike tone of his message, was also carried, and made a part of the bill. The explanation seems simple enough. President Jackson only threatened when he saw no inclination or promptness on the other side to pay, and now that the promise to pay is given, and the treaty is duly ratified by the Chambers, the threats go for nothing. We hope we shall hear no more of the business, and that the French and Americans will continue to be good friends, as they ought to be. It ought not to excite surprise to see the Carlist faction the most violently opposed to the just claims of the citizens of the United States. Their conscience is subservient to their politics. They would rejoice at the scandal of a war between Louis Philippe and the Americans, as they would at anything else that embarrassed or threw discredit on the new order of things. Moreover, the absolutists can never forget how great an influence the Americans exercised on the growth of liberal opinions in France, nor can they drive out of their old natures the hatred of a republican people.

In spite of the machinations of two desperate factions, the stronger of which is undeniably that of the republicans, the mass of the French nation is exceedingly well affected, and disposed to tranquillity at home, and peace with all nations abroad. In their dread of fresh emeutes, massacres, and revolutions, the sober citizens are even glad to see Louis Philippe strengthening the executive almost beyond all constitutional precedent. They give him credit for good intentions, believing that when the necessity shall cease to exist, he will cease to make use of means, and to resort to measures which seem to us quite despotic. The temptation to which he is exposed is dangerous; but who but the ultra-liberals have put liberty in jeopardy, and furnished arguments to those who cry out for a strong and fixed government, be it what it may, so long as it protects their lives, property and industry? This is the old story, but impracticable politicians will not be warned by the past.

The king is about to make an extensive tour in the provinces of France, beginning with the south.

SPAIN.

We cannot yet register, in our brief retrospect, the much desired fact of the civil war having ceased in this unhappy country. On the contrary, matters seem to be in much the same state as when we wrote last month; for, though the fighting in the northern provinces has been a little more active, it has led to no important results on either side. Lord Elliot and Lieut.-Colonel Gurwood, who were despatched by the late government, with the express object (as was stated in the House of Commons), of preventing for the future the dreadful cruelties exercised by the belligerents upon one another, seem to have been unsuccessful in their mission, and to have had communication only with the party of Don Carlos. It is, indeed, stated in some quarters, that Zumalacarreguay has ceased to shoot his prisoners, but we know the vindictive character of the Spaniards too well to believe, that as long as Mina exercises cruelty on the one side, they will fail making reprisals on the other; and cruelty, we are well assured, is, at the very least, as prominent as courage in the character of Mina. In spite of his bravery and passion for liberty—a passion that would be satisfied with nothing less than the democratic Cortes of 1812 and 1820—the constitutionalists committed a mistake in confiding the conduct of the war to this ruthless old man, who, in his best days, was nothing more than a bold adventurous leader of *guerillas* or loose troops, and who never had the knowledge and talent necessary for the supreme command of a regular army. When fighting for the Cortes in 1822, he consumed some eight or nine months in taking Castel-Follit from a mere handful of fanatic royalists, and the barbarities he exercised after the capture disgraced both him and his party. Mina entertained a mortal hatred of General Llauder, and is suspected of having resorted to some unfair measures to drive him from his post of minister of war; but no minister will ever have the fortune to give satisfaction to the old Guerilla Chief. Llauder may not have been the man best fitted for the office he held, and Mina's dislike to him was personally well gounded; but still what can we think of such a proceeding, under what is called a regular and established government, as this?

Mina openly declared that he would not serve under any government of which Llauder formed a part; *and that if Llauder dared to keep his post, he* (Mina) *would treat him as a personal enemy.* It is now generally reported that Mina has formally sent in his resignation, but that the Queen, to show her respect, and to keep good terms with him, has feigned not to accept it, but only to allow him leave of absence for four months. General Valdez has arrived at head quarters, with the intention, it is said, of changing Mina's plan of campaign, and prosecuting the war with vigour. This frequent change of commander produces a mischievous effect on the Queen's cause. The Carlists used to say insultingly, that Mina was the fifth bull turned out for them to bait,—Valdez will therefore be the sixth.

On the side of the constitutionalists, Generals Oraa and Espartero have obtained some trifling advantages; but in imitation of Mina, they have shot many of their prisoners, and issued proclamations, threatening the towns and villages in the mountains that harbour any Carlists, with fire and the sword, and utter destruction. On the other side Zumalacarreguay has taken a small fort, with two or three hundred prisoners, a little artillery, and a little gunpowder. Some serious disturbances have broken out at Malaga among the Urban Milita (in which the Queen's main strength lies), and tumults are reported as having occurred at Saragossa.

The cabinet of Madrid is notoriously full of intrigues, jealousies, and hatreds, at a moment when it ought to be animated by one heart and one wish. Martinez de la Rosa would expel Toreno, and Toreno aims at driving out Martinez de la Rosa, and then at succeeding him as the head of the government. The best news for the constitutionalists (if true), is, that M. Jauge and the Baron Haber have found themselves under the painful "necessity" of giving up Don Carlos's loan-contractings, and his banking business altogether.

PORTUGAL.

Prince Augustus of Portugal (the Duke of Leuchtenberg), after being for little more than one month the husband of the young Queen Donna Maria da Gloria, died at three o'clock in the afternoon of the 28th of March. His illness, which only lasted five days, was a sore throat, ending in a mortal inflammation of the trachea, a disease rather frequent in southern climates, and not very uncommon anywhere else. Though a fine-looking young man, some organic defects of constitution were discovered by the surgeons and physicians who opened and examined the body. As in all such cases, there was an immediate outcry made about treachery and poisons and as, during his short residence among them, he had captivated the very unsteady good-will or affection of the people of Lisbon, there was for some days an imminent risk of their committing some dreadful excesses, notwithstanding that the *post mortem* examination of the body was well authenticated, and made as public as possible.

On Sunday evening, the 29th of March, the day after the young prince's death, "some disturbances," as our newspaper correspondents mildly call them, took place in the Duke of Palmella's house at Chagas. Palmella has for some time been the *bête noire* of the ultra-liberals, and of the populace, who on this occasion simply accused him of having poisoned the prince in order to marry his own son to the queen—of having appropriated to his own use two millions of Portuguese money—and of having agreed with the Duke of Wellington to overthrow the Portuguese Constitution as now established! A furious mob collected in front of the Duke's residence, shouting "Down with Palmella!" "Death to the traitor!" The minister, who was returning home at the time, left his carriage, and endeavoured, by walking on foot, to get undiscovered into his house, but he was recognised on his own threshold by the rioters, a number of whom followed him up stairs with curses, and with threats of killing him, and burning down the mansion. The Duke of Terceira, the Count de Villa Real, the Viscount De Serra do Pillar, and some other gentlemen, were in the apartment when Palmella entered. Terceira, a man of extreme courage, faced the rioters, and endeavoured to turn them out of the house. He is reported to have said, "I am the Duke of Terceira, who freed you from Dom Miguel—kill me! I well deserve it for having liberated such a set of scoundrels!" Ashamed, and daunted, the crowd quitted the apartment and ran down stairs. Several of the national guards, armed with bayonets, are said to have taken part in this disgraceful scene. Terceira and Serra do Pillar followed the rioters to the gates of the house, which they closed upon them, and then, with some other friends of the family, remained on guard until troops arrived. At eleven o'clock at night a squadron of cavalry, which ought to have arrived long before without galloping at all, reached the house at *full gallop*, and a detachment of infantry, with ball-cartridges, soon followed. The Duchess of Palmella and her daughters had escaped by a back-door, and taken refuge in the house of the English Vice-Consul.

On the same evening General Saraiva, the prefect of the department of the Minho, and a member of Cortes on the ministerial or Palmella side, was assaulted by a mob in the suburbs of Lisbon, beaten, wounded in the cheek with a bayonet, and only escaped death through the courageous interference of one of Viscount Saa's brothers, and an honest pastry-cook. The war-cry, at this attack, was more simple than in Palmella's case, being merely "Down with him!" "Cut him to pieces—he is a ministerialist!" An armed multitude also beset the house of Freire, the minister for the home department, but in the minister's absence his domestics closed the doors, and made a valid defence. Mr. Pina Cabral, a member of the opposition side, on coming out of a club-house in the midst of the riot, was invited by the mob to put himself at their head and lead them on to vengeance; but he very properly declined the honour, and advised them to go to their homes, which they ultimately did. A little after midnight tranquillity was restored to the alarmed city. Verily the people of Lisbon stand in urgent need of the schoolmaster. Until, however, they can be benefited by his lessons, it behoves the government to maintain a somewhat more effective police.

On the afternoon of Tuesday, the 31st of March, the funeral of the prince took place without any rioting, or accidents whatsoever. As the sad remains of him, who only a few weeks before had come among them, youthful and full of hopes, passed through the streets, even the mob of Lisbon was awed into silence and respect. It is said that scarcely a dry eye was to be seen among the female spectators.

Early on the morning of the 2nd of April the Lower Chamber of the Cortes held a secret session, or meeting with closed doors, to provide for the succession to the throne in case of the young Queen's demise, and to debate who should be her next husband in case of her living—which we sincerely hope she may do.

"The people out of doors," who have evidently too great a control over the deliberations within the doors of the Chambers, wish the succession to rest at present with the princess Amelia, the infant daughter of Dom Pedro and the ex-empress, in preference to any of the Infantas of the House of Braganza. The new husband preferred for the queen is her deceased husband's own brother, and it is reported that, with singular want of decency and good feeling, Prince Maximilian of Leuchtenberg, who will be seventeen years old in October next, is to be forthwith affianced to Donna Maria. If any respect is paid to the Catholic religion, several obstacles to this union must, however, arise. According to the canonical law of the Roman Church, no such marriage can be contracted without the dispensation of the Pope.

TURKEY AND EGYPT.

The immediate renewal of war between these two countries, with which some of our political speculators have threatened us, does not appear to be a very likely occurrence at present. The Pasha, by paying to the Sultan an arrear of tribute amounting to about 140,000*l.*, has removed one ground of complaint; and though troops are occasionally marched from Constantinople into the Asiatic provinces, the Egyptian government is so confident of its power in Syria, and that no immediate attack is contemplated by the Turks, that Ibrahim Pasha has returned to Cairo, where he has been received with great rejoicings. According to recent accounts, he was on the point of making a tour in Lower Egypt, whilst Mehemed Ali travelled through Upper Egypt. Some insurrections of the Arabs on the shores of the Red Sea have been suppressed, but the numbers and attitude of the Wahabees are said still to be very formidable and threatening.

The marching of the Turkish troops into Asia is thus explained. Corps of the disciplined army are sent to supply the places of irregular soldiers that are continually drafted off to the capital and its neighbourhood, to be drilled and disciplined under the eye of the Sultan. The prudent and sagacious old Seraskier, who has "a voice potential" in all the Turkish Councils, reprobates the idea of undertaking a war against the Egyptians under existing circumstances. A small fleet, which Sultan Mahmoud had got ready for sea, is now said to be destined for Tripoli, to settle some differences with the Dey of that regency, and to leave in it two or three thousand of the Nizam-djedid, or regular army. Mahmoud's finances are in a deplorable state, and he is said to be involved in serious difficulties with Russia as to the payment of the first instalment of the debt he has acknowledged to that Power. Some of our leading newspapers have betrayed even more than their usual ignorance on this last topic. They say—"Achmet Pasha agreed that the money should be paid in Turkish piastres, which at the time were 33 to the ducat; they have since *risen* to 44 to the ducat; and Russia demands that the money shall be paid in *the present currency*. This is clearly a case that calls for an 'equitable adjustment,'" &c. The Irish bull here involved—*i. e.* of 33 Turkish piastres being equivalent to a ducat in 1832, but, after *a rise* in their value, 44 piastres being only equivalent to a ducat in 1835, may not be visible to the landed interest and the country parsons for whom the paper we have copied from is chiefly written, but it will create infinite merriment among the wits on the Stock Exchange. We will explain in a few words what we suppose to be the real state of the case. The Turkish piastre, which was once of gold, and about equal in value to a Spanish piastre (4*s.* 2*d.* English), has, in the course of ages, been repeatedly alloyed and deteriorated; and of late years, with the im-

ly to inquire into the working of the new system of labour, takes a different view of the subject. Their report, dated 13th November, 1834, states, "that the new system is not succeeding; that forty and a half hours of labour in the week are inadequate to enable the cultivation of the country to be continued; that the negroes are performing no fair proportion of work, even during that limited number of hours, and that during their own time very few of them will work for such rate of wages as sugar cultivation can afford to pay; that idleness and contempt of authority are daily becoming more apparent and alarming; that the pimento crop, the only article that has come to maturity since the 1st of August, has been to a great extent lost to the proprietors, from the impossibility of getting it gathered in; that the coffee crop now commencing is likely to share a similar fate, and that the prospect to the proprietors of sugar estates is still more desperate, in the certainty that their canes must rot upon the ground, from the absolute impossibility of manufacturing the juice into sugar during the limited number of hours which the factories can be kept in operation."

The alleged failure of the system is attributed principally to the following causes:—"1st, To the domestic authority of the master (which formerly constituted the main controlling power) having been so entirely destroyed that he cannot now exercise over the negro apprentices even the reasonable extent of authority which a master may in England over his apprentices. 2nd, To the local magistrates having been at the same time with the masters deprived of all power and authority to aid in maintaining the peace of society, and in enforcing the law. And, lastly, to the altogether inadequate number of the stipendiary magistrates, and the unfitness of many of them to discharge properly the difficult and important duties entrusted to them, from their entire ignorance of the peculiar habits and dispositions of the negroes, or of the fair and reasonable quantity of labour which they are competent and ought to perform. Other causes of minor importance have likewise been assigned. The conflicting modes of labour adopted by different proprietors; the equally conflicting decisions made by different magistrates: and a secret influence not susceptible of legal proof, but clearly at work to subvert the apprenticeship system, by the simple but sure mode of exciting a combination among the labourers not to work for wages in their own time, but, as they themselves express it, 'to go by the law.'"

"Your committee," it is added, "recommend as the only means of saving the colony from destruction, and giving some reasonable chance of success to the great experiment of slave emancipation,

"1st, That a more numerous and competent magistracy, possessing local experience and knowledge, be immediately appointed to preserve order, repress crimes, and enforce industry.

"2nd, That such amendments be made in the law as shall remove all ambiguity in it, by defining more minutely the relative duties and rights of apprentices and masters.

"3rd, That regulations be provided by law, to secure upon fair and equitable terms between masters and apprentices such reasonable time of labour for the working of the sugar factories as shall insure the safe gathering in of that great staple, upon which the prosperity of the colony and the welfare of all classes are in a great measure dependent. This regulation your committee deem to be of paramount necessity, in order to guide an ignorant, idle, and thoughtless people, hitherto accustomed to labour by coercion, into the way of working for their own benefit, and thus prevent the danger of their sinking into a state of indolence from which it might be impossible hereafter to raise them."

This report was drawn up in accordance with examinations taken on oath before the committee. The following is an extract of the evidence of Mr. Townson, a practical man, experienced in the management of landed property for thirty years:—"Will you state to the committee from your experience, whether the system of labour established under the Abolition Act is succeeding, or likely to succeed?"—I think the system adopted by the Abolition Act would have succeeded to the extent of the labour required, if carried into execution by persons competent to judge of what was proper; but under the present management it is a total failure. Some magistrates understand the law and their duty better than others, and properties under their control are more orderly and correct. But, speaking generally, there is a great want of knowledge as to what ought to be done, and a great reluctance to acquire the proper information, which is one cause why the system is not likely to succeed." "Are there any other causes to which you attribute the failure of the system?" "Yes, the want of active controlling power; uniformity in the hours of labour. Accustomed formerly to work by the rising and setting of the sun as their guide, the labourer required no other direction; but they are now referred to specified hours for labour, which they cannot yet comprehend; the power of the master is now superseded by the authority of the magistrate. In one case under my charge, in a very populous district in St. Ann's, the magistrate has not visited an estate with 190 people but once since the 1st of August, although frequently required to do so; the consequence of which is a gradual disorganization among the people. Shortly after the 1st of August they were civil, well-behaved, and obedient, but from want of the necessary control they turn out to work when they like, do what they choose, take what days they like—in fact, do as they think proper."

The want of a sufficient number of special magistrates was considered by all who were examined to be one of the principal causes of the non-success of the system. To the question, "Looking at the present state of the country, what regulations do you consider to be necessary to secure the peace of society and the continued cultivation of the estates?" The following is the general tenor of the answers given:—"I consider an increased number of magistrates as absolutely necessary, and some power to enforce their orders so that the law may be fulfilled. At present there is no power on an estate for carrying into effect the magistrate's orders, and they are often disobeyed, which at once creates insubordination." * * * The new system, in my opinion, cannot work well unless there are a few of the local magistrates, with equal authority in each parish, appointed to assist the special; they being well acquainted with the cultivation of the products of the country, and equally so with the peculiarity of the negro character, they would greatly assist the special in guiding them to a decision. It is impossible for a set of men to carry this great object into successful operation who are utterly unaquainted with the customs and feelings of a people, utterly unacquainted with the portion of labour that the apprentices are capable of performing, quite ignorant of the modes of cultivating the different products of the colony, and equally so of our laws. It is impossible the new system can be carried on under such defective means, as the result of the short trial it has had has clearly shown. The apprentices continue to do little or no work; numerous faults have passed unpunished and even unreproved; crime has followed. For society long to continue in the state it is obviously rapidly verging to will be impossible." "That the special magistrates be increased and armed with a constabulary force independent of the plantation constables, who in all cases are not to be depended upon; or that this duty be performed by the police, which would save expense to the parishes. The local magistrates to be invested with power, but not permitted to act in their own concern." "I consider the only means which can be adopted to remedy its defects are, an increased number of stipendiary magistrates with a larger police, or other force, to carry their orders into effect; if which plan, or something like it, be not adopted, the estates must be thrown up."

At the very commencement of the new system it was the opinion of the Marquess of Sligo that the number of special magistrates originally sent out from home was insufficient for the duties they had to perform; and in consequence of his representation on that subject an additional number were appointed. In reply to an address of the Council and Assembly he says; 'Several of these (magistrates) have been already appointed by me from amongst the residents of this island, and the rest I am assured will be sent out by the first opportunity. All the vacancies which have occurred since my arrival have been filled up by persons already established here, and I have strongly recommended to the government their confirmation. Some of your local magistrates have been appointed by me to the special commission, and I have procured the unsalaried services of other persons eminently qualified for the duty. Between those now employed and those whom I have the certainty of having in I trust not many days at my disposal, there will be fifty persons qualified to act as special magistrates in this island, and I anxiously hope that his

majesty's government will, in consequence of any more recent representations, feel themselves justified in making a further increase in the number already appointed."—p. 49.

The principal defect in the system was thus remedied.

The supposed inability of obtaining negro labour for hire was another serious evil, which it was said threatened the planters with ruin. From the evidence given before the committee already mentioned, and before another appointed a short time afterwards to inquire farther into the subject, it would appear that apprehensions in this respect were but too well founded. The following are a few of the answers selected from many others of a similar nature to the question, "Have you found the emancipated slaves disposed voluntarily to hire themselves for a fair rate of hire?" "I have offered a fair rate of wages, but the apprentices would not accept it." "I have tried them by a proposition to them to work during crop, but they refused to do so. I asked them if they would keep the factory going during breakfast and dinner hours; they replied, 'no, they would go by the law.' The people to whom I allude were the people among whom I had longest resided and best known, and who are as well disposed apprentices as I have ever known, and from whom I had consequently the best expectations." "No, I have not: on the contrary they have objected in every instance." "On all occasions when I have offered them reasonable hire they have refused to accede to it." "I offered my own negroes money wages, at the rate of 2*s*. 6*d*. with the usual allowances for nine hours actual labour, but they all refused." Mr. Gordon states, "I found no difficulty in inducing them to work for money wages;" and the evidence in two or three instances besides is to the same effect. "I have on my own estate within the last two weeks." "I made some sugar on my estate, the Bogue, the early part of August, and the apprentices worked in their own time for money wages." It is evident that the negroes did not at first believe they should actually receive money for their labour, but when once convinced of this, the difficulty of obtaining their assistance immediately vanished. The following extracts from letters written at a subsequent date to the evidence above given, completely set at rest all apprehension on this subject.

"I have great pleasure in observing that the conduct of the apprentices in making arrangements for crop and money contracts, and honestly performing them, has in this district completely falsified the assertions of the alarmists, and prove that with equitable management and inspired confidence the negro will work for money, and work cheaply too." "I have recently, as special magistrate, sanctioned an arrangement between master and apprentices, both on the estate of the Lodge and Colbecks in this parish, by which the apprentices have engaged to employ a portion of their free time in taking off the crop of 1835 and in working much of the crop of 1836, on terms which will not cost the proprietors one-half of one years' interest of the compensation money. A disposition to work in their free time on terms equally favourable to the proprietors is not only general but universal among the negroes of this parish; and if such should be the case through the island generally (and I am strongly inclined to believe it is the case), the success of the apprenticeship system is placed beyond the reach of doubt."

"At Oxford, Mr. Phillpots complains that the apprentices fairly bully him to employ them on their own days. They say that you (their employer) are anxious that they should be hired, but that the overseer begrudges them the money which you have put into his hands for that purpose. I have but little doubt that during crop you may command as much of the time of the apprentices upon both these estates, either by night or day, as you may think it expedient to pay for."

"The apprentices on King's Valley have agreed in my presence to work in their own hours during crop at the rate of 1*d*. per hour, although I assured them that no compulsion would be used in that respect. * * * If gentlemen would call on the special magistrates to be present when proposals are made respecting their employment in their hours they would seldom decline the offer. But without the presence of a magistrate, and his assurance to see them paid, there is considerable distrust on their part."

"I was told by Dr. Wright of Manchester, that a gentleman (I think of the name of Lewis) in his parish had lately bought a property which he is working by free labour (that is, by apprentices in their own time) at the rate of 2*s*. 6*d*. per day; and that he heard a few days since that there were upwards of 200 employed in cutting down large trees and clearing the land for the cultivation of coffee. I was on a property in St. Elizabeth where the apprentices had offered to pick coffee in their own time at 1*s*. 8*d*. per day, but were refused employment by their master at that rate, although their master has stated publicly that the apprentices were not working and would not work in their own time."

"Indeed, my lord, nothing can be more contrary to fact than that the people of this district are indisposed to work in their own time for money, or cash, as they annoyingly term it. Now that they have seen the wages paid, their apparent indifference has been everywhere thrown off, and on some estates there are offers of service beyond what is required. The truth is, they were told at ——, in an unhappy moment, that they should be made to take off crop without wages, and this impression at once spread throughout the district; so that nothing but the fact of their seeing a system of wages actually introduced could satisfy them that it would be a reality. True it was that when the people were at first told laconically by the overseer that the mill must be kept about till eight o'clock they said 'no night spell.' Having heard of this, and knowing the general good disposition of the people, I went on the estate on the day the mill was put about and called them together; they assembled in the most orderly manner and listened to my address with a degree of quiet attention and respect scarcely to be exceeded; in conclusion they one and all said my 'word was good,' and they would do as I desired. They went to their work, and have since carried it on with a steady, persevering, diligent manner."

"The disposition to work for wages in their own time is becoming general. On some of the estates there are always many supernumerary hands waiting to hire themselves for the half nights' spell, in the event of deficiencies among those to whose turn it falls. I am glad to find that the attorney who first said that the people would not work for wages, when he had never asked them, and then refused to pay wages when the people offered their time, has been at length persuaded to yield the point, and his overseers are authorized to make agreements with the people for such time as they may require."

In the evidence taken before the committee, all the witnesses concur in their testimony that the managers of estates have been anxious to enter fairly upon the new system, and to do all in their power to carry it into execution. This assertion is rather at variance with the facts contained in the three last extracts given above; and from the several despatches of the governor it may be inferred that at best some of the overseers were not at first judicious or conciliatory.

Respecting the relative quantity of labour obtained from the negroes before and since the 1st of August we find various statements. "Formerly seven labourers would strip the trash (dry leaves) from an acre of canes in a day; but on the property in question it took twenty-five people, one day last week, to trash an acre of plant canes about ten months old, without any grass weeding; and, as far as my observation goes, the quantity of labour in all field occupation is reduced nearly to the same scale." "On some properties they are doing what I consider a fair and reasonable portion of work; but on a majority they are not doing at this present time over two-thirds of what I consider they should perform." "They are now only doing, where I am concerned, about one-third of what they used to do under the old system. The apprentices appear to me to have worked most sulkily, and have not performed, at any average, two-thirds of their former work, and often not more than one-half." One-third, a half, and two-thirds, are variously stated as the proportions of work now obtained as compared with the work done under the old system. From other testimony, however, it appears that the negroes are equally industrious as before the alteration. "For some time after the 1st of August they did not perform more than half the work they formerly did; I then applied to the stipendiary magistrate who ordered some of them to be punished and to make up the deficiency on Saturdays since that they have done as much work as formerly for the number of hours." "As there is a reduction in the time of labour, there must of necessity be a proportionate reduction in the quantity of labour given. Beyond this, I am not sensible of any material difference." "I observe no alteration in the work of the people under my charge since 1st

August, and the overseers report most favourably." "During the nine hours I think fully as much work is done as under the bygone system; and in this opinion I am borne out by my neighbours." "On some estates, making allowance for the difference of time established by law, the negroes are clearing canes at the same number per acre as they formerly did. On other estates they are not doing it, but they have improved very much in their work within the last five or six weeks." In an extract from a letter dated 1st December, we find a much more favourable account. "I have no reason to complain of the working of the apprentices; indeed it is quite the reverse, for they have done the same description of work through the nine hours as they formerly did in twelve. * * * If it was not tedious to detail, I have it before me, the minutiæ of work, where I find that what under slavery took four and three minutes to perform, has taken under the apprenticeship three and two."

To the question put by the committee of the assembly, "Do you consider it possible to carry on the manufacture of sugar under existing circumstances," almost all the answers were unhesitatingly in the negative. "No, I do not," "It is impossible," "Decidedly not," "No, by no means," and many others in nearly the same words or to the same purport. After reading such evidence it is gratifying to learn from the governor's despatches, and from extracts of letters addressed to him, that the accounts during crop time were most satisfactory. "As the mills are all now about, I believe I may safely affirm that there is not a single instance throughout the whole district in which any doubt is now entertained of getting off the crop. Certainly nothing short of great improvidence or real imbecility on the part of the managers can obstruct it." "At Golden Grove they potted last week either sixteen or seventeen hogsheads; at Holland Estate nearly the same quantity; and I have the managers' own testimony on both estates, 'that they never saw the people either work better or behave better.' After all that your lordship has heard, I deem these facts worth communicating. Further, my lord, with respect to Golden Grove, and the statement is so gratifying as to require nothing less than the best authority, the attorney himself now informs me that he finds they shall have potted fully as much by Christmas as they made by the same period last year." "We are making at the rate of twelve hogsheads per week. At this rate we shall take off a crop equal to the last, viz. 400 hogsheads, say in thirty-three weeks. The wages given in that time will amount to 160*l.* sterling, an expenditure equivalent, as your lordship knows, to a deficiency of about ten hogsheads. When we consider, my lord, that in the majority of cases this outlay will be more than met by the *interest* on the compensation money, that we may confidently expect an improvement in the quality of the sugar made from the abolition of night work, and that the quantity lost by plunder will be diminished; when we reflect also upon the number of able labourers who were converted into hospital patients by exposure to night air under the former system, and consider that this evil is (if not removed) materially reduced by the new regulations; when, my lord, we give to such considerations the attention they deserve, does it not appear that, provided the change is fairly met, the condition of the proprietor is rather improved than otherwise, as far as relates to the time of the apprenticeship system." * * * "The result of their admirable exertions in sugar making up to this period is that they have actually potted ninety hogsheads, which is five or six more than last year, the mill having on each occasion been put about on precisely the same day, November 5th."

In the evidence before the committees the answers to the question "How is the new system of labour succeeding," are also with but few exceptions pretty nearly the same in substance, and unfavourable. "Not to my expectations," "Very indifferently," "Very ill," "Very badly lately," "Not as well as I could wish," "Not at all well," "Nothing could be worse," and answers of a similar kind, are those generally given. Two or three witnesses, however, expressed a different opinion. Mr. Farquharson says, "So far as I am concerned, I have seen no alteration." Mr. Gordon says, "It is succeeding to my satisfaction. * * * I think it is working much better than could have been expected, and that it is daily improving in its work." The despatches of the Marquess of Sligo of later dates than the above evidence confirm the justness of the views taken by the last-mentioned gentleman, and many extracts from letters received by his lordship still further show that the system does work better than was at first imagined. The following is an extract from a despatch dated 9th December, 1834:

"I am happy, however, at being able, in conclusion, to state that, in spite of all the obstacles which I have met with, matters are up to this date, hourly coming into a more healthy state. In proof of this I have the honour to enclose to you herewith some copies or extracts of letters from persons in whom I can confide, pointing out the great improvement which has taken place during the latter weeks. The masters are becoming more reconciled to the new system and the apprentices more reasonable. The consequence is that the negroes are falling by degrees into a steady system, advantageous alike to themselves and the proprietors. I cannot help thinking that the managers will now, when the important season of crop is arrived, feel that their interests are too important to be trifled with, that ruin must follow their want of success; that all chance of recovering their lost power of punishment is passed by; will really co-operate, and each in their own interior adopt their only resource, a humane but energetic system, which will produce the best effects on the minds of the apprentices."

The extracts from the letters mentioned above give most favourable accounts of the *improved* working of the system.

"Crime has evidently diminished and my labours have been divested of much of their anxiety." "From the good behaviour and perceptible improvement in the apprentices, especially on this property, their orderly and peaceable conduct entitle them to commendation; doing their work cheerfully and attending to all that is told them. From the few cases in this week's report, your excellency will perceive that crime is fast diminishing in this parish, and the apprentices on most of the estates are now turning their minds to labour as they ought to do." * * * "The conduct of the negroes in this parish is at present in the highest degree peaceful, orderly, and industrious." * * "I have pleasure in stating to your excellency the apparent peaceable demeanour of the apprentices and the favourable report of several managers on my route, and also the total absence of complaints." "I believe everything in this district is progressing as well as the most sanguine could expect. I have the mill on about twenty-three estates and no complaints." "The mills are all at work, and in my opinion everything will go on well. The negroes appear to be well inclined to do what their masters require of them." "I never was half so confident as I am now of the peaceable disposition of the negroes. I never knew them so greedy for money, so industriously anxious to earn it. I enclose you the proofs upon which I ground this opinion, and I could send you many others." "I had the pleasure of ascertaining from the attorney of Blackheath estate, where the negroes were very troublesome, that they were latterly behaving well and industriously." "From no estate since my last return of proceedings have I received a single complaint of indolent or insufficient work. I think I may therefore fairly infer that the people are generally working well; that they wear a more cheerful and contented aspect I myself discover; and this alone is no immaterial sign that there is no mischievous scheme in their heads to be developed in the holidays."

"On my last visit to Pera, where your excellency will remember some trouble was given, the people requested to be allowed to assemble, that I might tell them the law respecting crop time. Instead of the confusion and turbulence manifested before, they listened with decent attention and marked respect. When I alluded to their former behaviour, for the purpose of expressing my gratification at the contrast, they one and all said, 'We beg massa pardon, we was wrong, massa.'"

"Annexed I transmit my diary for the week ending this day (24th Dec.), which embracing the offences of a population of 12,000 apprentices, is an index of the diminution of crime, and the return of industry and cheerfulness; nothing can exceed the general propriety of conduct of the apprentices in this district. I have twenty-five estates all working upon the same agreement, and without the slightest misunderstanding or sullenness. I have been most anxious and particular in my inquiries as to the manner in which the apprentices do their work, and I have been generally assured they are working with cheerfulness and industry."

The despatch of the governor, dated 25th Dec. 1834, displays much good sense and feeling, while at the same time it gives an encouraging view of the state of things. He

observes, "That the negroes are fully aware of their own rights, and determined to maintain them, is true; that they in their present comparatively blessed position do not do as much work as before is also true; that they have occasionally shown a sullen temper I do not deny. Hard it would be to select 340,000 persons of any nation amongst whom there are not some sullen persons; but the instances are *very few*, and in many cases to be attributed to the threats that are so much too frequently held out to them, that they shall be deprived of all their comforts, of the ground they have so long enjoyed, of their stock, and in short, as I have good reason to think was the case in one or two instances, that "he (the overseer) would leave them little worth by the time their apprenticeship was over." These cases are, however, few, and the sulkiness was also rare. The masters and managers are getting more reconciled to the new law, and complaints of their cruelty rarely are brought forward now. The consequence is that more work is doing. * * * Men used all their lives to coercion cannot be well acquainted with persuasion deprived of power. The negroes take advantage also of their exemption from punishment. All that, however, is settling down fast, and I do not at all despair of seeing a great part of them fall into industrious habits. About a month or six weeks ago I had much misgiving in my mind as to this crop being taken off; but now, though it may fail partially, I do think I can with safety say that the majority will be got off satisfactorily, not to the extent perhaps of last year's, but quite enough to prove that the new system is not so desperate as has been imagined. Much injury has unquestionably resulted from the want of a sufficient number of special magistrates; but with those you have given me, and the facilities you have placed at my disposal with regard to the employment of some to act without salary on the payment of certain contingent expenses, I think that any cause of complaint on that score is abundantly got rid of. It is somewhat a remarkable fact that in many instances the negroes would not enter into any kind of bargain with their masters, but that the moment the special magistrate has been present and guaranteed to them the due performance of their bargain, they have at once assented."

Considerable anxiety was entertained as to the manner in which the Christmas holidays would be passed, it being feared by many that a concerted plan was formed for a general rising of the negroes at that period. The apprehensions upon this head were happily ill founded; the Marquess of Sligo in a despatch dated 12th January, states "That the holidays have passed off in a manner quite to excite astonishment. * * * The 1st, 2d, and 3d of Jan. were also holidays in most parts of the island, and the negroes returned to their work on the fifth with even more exactitude than formerly had been remarked to have been the case." Extracts from letters received by the governor from all parts of the island fully confirm this statement. Mr. J. Daughtrey, special magistrate, writes—"The negroes of this district (Bath) have fully realized the best hopes of their friends in their behaviour during the holidays. It has not only been irreproachable but admirable. I may venture to assert, that in no part of our own three kingdoms could you find a population of the same density in which a similar season would have passed over with equal cheerfulness and equal decorum. They have really been what our own poor are seldom able to be, both "merry and wise." My Lord, the Bushers themselves have evidently been struck with surprise to see the people whom heretofore they have been too apt first to depreciate and then to despise, conducting themselves throughout the entire period of festivity in so rational, sensible, and inoffensive a manner. I will do these gentlemen, however, the justice to say that they have on this occasion been candid and unreserved in the testimony they have borne to the behaviour of the people. Everywhere they have assured us that it has not only been blameless, but marked by a degree of propriety and self-restraint *never witnessed before*. No mean evidence this, I think, that the partial change which has taken place in their civil condition is now at least acting favourably. And may not your excellency fairly indulge the hope that with the advantage of wholesome instruction, and a firm but impartial administration of the existing law, they will at no distant day acquire the virtue, and become fitted for the duties, of the entire freedom which awaits them at the expiration of the apprenticeship? Having spoken of their behaviour during the holidays, I must not omit to add that the turn-out on Monday morning was in proportion good and unexampled. Instead of coming late, or of repairing in numbers to hospitals, as was the case in former years, all were found in their places when the lists were called. Throughout these large river estates, I have yet heard of but a single absentee, and his case was expected to be accounted for. Such a report as this, from the most valuable district in the island, must be gratifying to your excellency, and I transmit it with feelings far beyond those of mere official satisfaction."

"The holidays have thus far (31st Dec.) passed off in this district undisturbed by the occurrence of any serious impropriety; the apprentices of several estates which I made a point of visiting *unofficially* were in high spirits, and evidently too seriously bent on enjoying their little carnival to spare even a passing thought on mischief."

"I have visited nine properties yesterday; no complaints; and the managers have informed me that for years they have not been so regular at work after Christmas, or so cheerful as they observed them this year." "The Christmas holidays have passed off in the most orderly manner. Not the slightest complaint on the part of the master, apprentice, or any other person came before me, although often more than 2000 persons were in one day assembled in Port Antonio during these holidays; not even a guard was necessary."

"I beg to add that the Christmas has passed over here most satisfactorily, and without the slightest symptom of dissatisfaction. The church overflowed, and the usual negro amusements were carried on with undiminished spirit." "I am happy to inform your lordship that as far as has been seen no people *could possibly* conduct themselves *better* than the apprentices have done all over the district; and yesterday morning (except in one or two instances) they were all at work at the proper hour."

In the last Despatch, dated 6th March, we find it stated that "Nothing can be going on better than everything in this island." On the whole, then, we may fairly indulge the hope of a happy result under the watchful superintendence of the present governor, whose firm, conciliatory, and judicious conduct has already had so successful an influence, and anticipate that in a short time both masters and apprentices will be equally benefited under a system so much more in accordance with justice and religion than that which formerly subsisted.

THE PRINCIPALITIES OF WALLACHIA AND MOLDAVIA.

As recent events have drawn public attention to that much neglected country which lies between the Danube and the Pruth, we will endeavour to give a concise account of the two states into which it is divided, and which have been for centuries either dependencies or integral parts of the Turkish empire. Wallachia, after a brave resistance, submitted in 1418 to the arms of Sultan Mahomet I., who merely imposed an annual tribute of 3000 piastres, and left the country its national government and Christian religion. Moldavia was not conquered by force of arms, but, terrified at the progress made in Servia, Hungary, and in all directions by the Turks, she voluntarily surrendered her liberties to Solyman I. in the year 1529. The terms she obtained were much the same as those granted to Wallachia, but her annual payment to the Porte was not called a tribute, but *bash-sheesh*, or a present. According to the letter of the treaties, signed by different sultans, the Turks were to protect the Wallachians and Moldavians against every enemy, without exacting from them anything else than the acknowledgment of the sovereign supremacy of the Porte, and the stipulated annual payments which were neither to be increased nor decreased. The Turkish government was on no account to interfere in the internal administration of the two principalities, nor was any Turk to go into those territories without an ostensible motive. The vaïvodes or princes both of Wallachia and Moldavia were to continue to be elected by the archbishops, the bishops, and the boyars or nobles, and their free election to be recognised by the Porte. The two principalities were to enjoy the free exercise of their own laws and customs, and their vaïvodes to have the right of life and death over their own subjects, without any kind

of responsibility towards the sultan. No Mahometan mosque was to be built, the Christian religion was never to be molested by the Turkish government, and no *firman*, or imperial ediot of any sort was ever to be issued in relation to the interests and affairs of the two states. All Turkish merchants or other Mahometans going into Wallachia and Moldavia were to have the express permission of the Christian government, and were to depart peaceably when their business was finished, without taking with them as servants any Wallachian or Moldavian subjects, whether male or female.

These were certainly honourable and advantageous conditions, but they were only granted at busy or critical moments, when it was essential to the success of the sultan's wars elsewhere, that the principalities should remain tranquil and friendly. As soon as that necessity ceased, the Wallachians and Moldavians met with the fate that usually attends the weak who negociate and connect themselves with the strong. Their treaties became little more than pieces of waste paper, being observed in their ordinary manner by the Turks, whose reputation for good faith in such matters we could never understand. The privileges accorded to the two Christian states were nearly all infringed; the tribute was arbitrarily and beyond endurance increased; the productions of the soil were monopolized for the Turkish markets; and, finally, after numerous acts of cruelty and oppression, the government was taken from the native vaïvodes or princes elected by the native nobility, and put into the hands of the Greeks of the Fanar of Constantinople, who, like mere pashas, were nominated by the sultan, and also, like the pashas of the Turkish provinces, recalled, put to death, or exiled in rapid succession. These hospodars, as they were styled, of Wallachia and Moldavia, obtained their places through bribery and intrigue, and almost invariably lost them through the same means, which were frequently employed against them by their own near relations in the Fanar, infatuated by the desire for a little pomp and power, though all precedent went to show that they briefly ended in disgrace and death. An hospodar seldom reigned many weeks after he had been outbidden at the Porte by another candidate. Their government was grinding and ruinous to the population of the principalities, and a curse to themselves and their race, for nothing contributed more powerfully to degrade and demoralize the best born and wealthiest of the Greeks—to turn their souls to chicanery, base cunning and treachery, than this career of insane ambition. All these infringements of solemn treaties did not take place at once, or without opposition from the Wallachians and Moldavians. The Turks made their encroachments by degrees. In 1544, crossing the Danube, which had hitherto been the frontier between the Ottoman empire and the tributary states, they obliged the Wallachians to cede them a long strip of territory on the left bank of that river, where they soon built Ibraïl, Giurgevo, and Tourno, three of their strongest fortresses, which are so frequently mentioned in the history of their wars with the Russians. Having thus obtained a firm footing on what we may call the Christian side of the Danube, they soon began to treat the inhabitants of the principalties in the same manner in which they treated the Greeks, the Bulgarians, and other non-Mahometan conquered subjects. The garrisons of the three fortresses made frequent excursions beyond the territory assigned to them, plundering and devastating Wallachia as if it had been an enemy's country. The moment in which the Wallachians ought to have risen in arms for their liberty and property, and the Moldavians ought to have joined them, was when the Turks first began to erect their three strongholds; but they lost that opportunity; they stood by and saw Ibraïl, Giurgevo, and Tourno completed, and made no efforts for several years after. At length, in 1593, the boyars elected a vaïvode of courage and enterprise. This was the celebrated Michael, who, forming an alliance with Aaron, Vaïvode of Moldavia, and Sigismund, Prince of Transylvania, which country was also tributary to the sultan, resolved to drive the Turks beyond the Danube and restore the two principalities to their ancient independence. Before drawing the sword, Michael employed the pen, and in his own and the name of his allies sent a list of grievances to the Porte, demanding their redress, and a guarantee for the future. The sultan's only answer was delivered by 3000 janizaries, who were sent into Wallachia to levy contributions on the peasantry, and committed all kinds of outrages. A corps only recently raised and armed was at last despatched to put a stop to their excesses. The Wallachians surprised the janisaries and cut them to pieces. Their vaïvode, Michael, then placed himself at the head of the allied army of Wallachians, Moldavians, and Transylvanians, marched against Giurgevo and drove the garrison of that fortress to the Turkish side of the Danube. For three years the formidable attitude of Michael imposed respect on the Turks, but in 1595-6 Mahomet III. despatched his Grand Vizier to the Danube with an army of 40,000 Osmanlys and 20,000 Tartars, who, crossing the river, invaded Wallachia and Moldavia at the same time. The principalities sustained a war of five years; the Turks were frequently defeated by Michael, and the sultan was obliged for a while to give up his pretensions. As on so many other occasions, it was the dissensions among the Christians that brought about the triumphs of the Mahometans, but the disgrace of throwing Wallachia and Moldavia prostrate before the Turks, who soon made them two of the most wretched states in Europe, is mainly attributable to the court of Austria, which then, and for many after-ages, claimed to be the head of the Holy Roman Empire. In 1600, Sigismund, the former ally of Michael, abdicated the government of Transylvania, which country then became tributary to Austria. In recompense for many splendid services rendered to the common cause of the Christians against the Mahometans, and for some more private assistance by which he had greatly profited, the Emperor Rodolph entrusted the government of Transylvania to the brave and skilful Michael. It appears, however, that the abdication of Sigismund, the former prince, was not voluntary, for when the Transylvanians were disgusted with Michael, or rather with the Austrians for whom he ruled, and invited Sigismund to return to them, he immediately went and put himself at the head of a formidable insurrection, which obliged Michael to retire into Wallachia. An Austrian army, under the command of General Basta, soon arrived in Transylvania to support the emperor's pretensions, and this force was joined by Michael, who brought with him some of the best of his Wallachian troops. The united army attacked Sigismund, who, after an obstinate and sanguinary battle, was completely defeated. The victory, but for Michael, would not have been won, yet it was scarcely obtained when the treacherous Austrian general, Basta, plotted his destruction. Dissensions arose between the two commanders as to the future government of Transylvania, and jealous of the power of Michael, and instructed by his court to oppose his aggrandizement, Basta cut the matter short by having the vaïvode assassinated. On the death of this the last of their great men, and indeed almost the only great man they have ever had, the Wallachians returned to their own country carrying with them Michael's head, which was deposited with pomp and sadness in the monastery of Dialloluy, near to their capital. This event took place in the year 1602, and caused the greatest confusion and terror in Wallachia. The primates, the senators, destitute of courage and decision, lost time in talk, while the Turkish pashas in the neighbourhood, being well prepared to act, crossed the Danube at several points and occupied the greater part of the principality. Scarce a blow was struck by those people who only a short time before had fought so obstinately under Michael. The sultan assumed to himself the right of naming the vaïvode; other privileges and rights of the Wallachians were violated or abrogated by the Turks, the annual tribute was greatly augmented, and the three fortresses on the left bank of the Danube were made stronger than ever.

There was a slight difference in the fate of Moldavia; and in that principality the Poles, who were not then a *conquered* and *oppressed*, but a *conquering* and an *oppressing* nation, were chargeable with the blame which, in the case of Wallachia, lies on the Austrians. In the year 1598 a Polish army invaded and conquered Moldavia, but in 1602, when the Turks, after the death of the Vaïvode Michael, became again masters of Wallachia, the Poles surrendered the neighbouring principality to them, and retired without making any conditions for the unfortunate Moldavians. Leaving them the mere form and ceremony of an election, the sultan named their vaïvode also; the tribute was no longer called a present, as it had been, and its amount was increased at the nomination of every new vaïvode.

Though in both principalities the ancient constitution and right of election were destroyed, the vaïvodes for another century were at least natives of Wallachia or Moldavia, and

not foreigners of a different race, language, habits, and interests. Moreover, the sultan, though he forced upon them the nominal honour of *mirmiranc*, or pashas of two tails, did not as yet arrogate the right of treating these Christian princes like pashas, or of punishing them with death. Under this state of things, humiliated and disgusted as they were, some sparks of nationality and courage were kept alive, and during the seventeenth century both the Wallachians and Moldavians made several attempts to throw off the Turkish yoke. But the struggle, always unfortunate, was a most unequal one, as the united population of the two principalities did not amount to much more than a million, at a time when the sultan, between Europe and Asia, was absolute lord of fifteen millions of subjects. Towards the end of the seventeenth, and still more at the beginning of the eighteenth century, Austria and Russia, whenever it suited their interests or they had war with the Turks, intrigued with the boyars, and exerted themselves to the utmost by presents, brilliant promises, and proclamations, in the name of religion and freedom, to induce the Wallachians and Moldavians, whose territories lay between them and the Turks, to join the Christian banners, or to co-operate by secret measures against the sultan. There was little honour or sincerity on any side, and as soon as it suited Russia or Austria to make peace with the Turks, she generally concluded a treaty without caring much as to how far she had committed the principalities, or as to the vengeance the sultan would take on what he considered his revolted subjects. At a later period Wallachia and Moldavia became, like the plains of Lombardy and the Netherlands, a regular battle-field on which foreign nations used to decide their quarrels. For many years, as soon as hostilities broke out between them, the Turks from the south sent their janisaries, spahies, delhis, and the rest of their barbarous host across the Danube, and the Russians from the north, crossing the Pruth at the opposite extremity of the principalities, soon filled them with their Cossacks and other almost equally savage hordes.

It would be difficult to say which of the belligerents inflicted most mischief, but the fact is obvious that between the two, the condition of Wallachia and Moldavia, that could defend themselves from neither, must have been wretched in the extreme. The last native prince was Constantine Brancovano Bessaraba, vaïvode of Wallachia. In 1710 this prince, who several years before had been seduced for a short time by the Austrians, was gained over by Peter the Great, who then contemplated the campaign against the Turks which the following year terminated so unfortunately for the Russians on the banks of the Pruth. Peter and his army were extricated by the sagacity of the Empress Catherine, but Bessaraba, whose manœuvres were well known to them, was left to the tender mercies of the Turks. The ill-fated man attempted to conciliate them by sending large sums of money to the Sultan and costly presents to the Turkish ministers; but this plan only aggravated the horrors of his end, as it induced the Porte to believe that Bessaraba was in possession of exhaustless riches, which could be wrenched from him only by imprisonment and torture. Feigning, however, to be well satisfied with his gifts and the explanation of his conduct, the Turks left him undisturbed for many months, in order that his fears and suspicions might go to sleep. At length in the beginning of the Passion week of 1713, when the attention of the Wallachians was absorbed by the interminable ceremonies of the Greek church, a Capidgi-Bashi (a chamberlain, messenger, or executioner, as it may be, of the sultan), arrived at Bucharest, the capital of the principality, with an escort of only one hundred Turks. The Capidgi sent immediately to inform the vaïvode that he was only travelling through Wallachia on his way to Chotzim on state business; that he was in a very great hurry, yet being at Bucharest would take the opportunity of paying a short visit of ceremony to the prince. No sooner was he admitted than he put a black handkerchief on the shoulder of Bessaraba, who had risen from his seat and advanced to receive him as a friend. Having performed the ceremony of the handkerchief, which, according to Turkish usage, signified the deposition of the prince, the Capidgi-bashi placed a guard over his person, and going to the divan of the Wallachian authorities read the sultan's firman, which declared Bessaraba to be a traitor, and ordered that he and all his family should be seized and carried to Constantinople. Stupified and panic-struck the Wallachians permitted the Capidgi to secure all the public treasure and the private property of the vaïvode; nor, though many thousands of them were soon aware of what was going on, did they make a single effort to rescue their much loved prince from this mere handful of Turks, who rapidly carried him, with his wife, four sons, three daughters, and an infant grandson, to the infamous dungeons of the Seven Towers. The property confiscated appearing a trifle in the eyes of the sultan in comparison with the enormous sums he had expected, he caused the four sons to be put to the torture in presence of their father, in order that they should confess where Bessaraba had concealed the rest of his treasures, or that the vaïvode, at the sight of the horrid sufferings of his own flesh and blood, should himself make the revelation. These hellish scenes were repeated on three successive days, on the third of which the inviolable person of the prince was also racked and torn. But as none of them confessed an impossibility (the vaïvode having no concealed treasure) father and sons were all beheaded under the windows of the seraglio, from one of which the sultan watched the execution with an attentive eye. The five bleeding heads, stuck upon poles, were carried through the streets of Constantinople, after which they were probably thrown to the dogs; but their bodies being cast into the sea of Marmora were wafted by the current to the island of Chalki (one of the beautiful group called "the Princes' Islands"), where they were picked up by some Christian boatmen, and buried in a small and obscure Greek monastery. The name of Bessaraba was, and still is, venerated by his countrymen, who, however, had not the spirit to draw a sword to avenge his death and their own wrongs. Two days after his deposition the sultan arbitrarily appointed a Fanariote Greek to be his successor, and that dishonourable and foreign class of men continued for generations to be named by a Turkish Beratt or diploma and proclaimed by a Turkish Capidgi-Bashi.

These hospodars were named for three years but the sultan recalled them whenever he chose. Every change entailed an increase of oppression and misery on the unfortunate Wallachians and Moldavians; for the Fanariotes generally arrived among them burdened with debts which they had to pay out of the gains of their office, and as their stay was so short they resorted to every measure to make much money in little time. They also sent annual presents to preserve the friendship of the Turkish ministers, and in case of war or any emergency the sultan exacted subsidies which could only be obtained by still farther impoverishing the people. As property was no longer secure, as the farmer who sowed could not be certain that he should be allowed to reap and dispose of his own produce, the lands, in many instances, were left wholly uncultivated, and such of the agriculturists as could conveniently escape emigrated to the Austrian or Russian territories. That excellent old traveller, John Bell of Antermony, says, that when he was in Moldavia in 1737 no less than two-thirds of that principality was lying waste.

Among the servile and rapacious Greek hospodars there was one man of a noble soul and most elevated philanthropy, who zealously applied himself to promote the good of the country he was sent to govern. Constantine Mavrocordato was appointed hospodar for Wallachia in 1735. Afflicted at the degradation of the mass of the people, who were serfs, and being convinced that one of the surest means to increase the prosperity of the state was to elevate the condition of the popular body, he, in many instances, abolished slavery altogether, and generally improved the comfort and happiness of the peasantry. Mavrocordato had moreover the glory of being a religious instructor, an educationist, and a diffusionist. The language of the courts of the two principalities was, as it still is, the Romaic, or modern Greeks which was unintelligible to the people, and only spoken (and not written) by some of the boyars or nobles. The common idiom of the Wallachians and Moldavians was a strange mixture of several languages, in which, however, Latin, and a dialect of the Slave or Sclavonian, predominated. It had no alphabet suited to convey all its sounds and desinences, but on the rare occasions on which it was written, Sclavonian characters like those used by the Russians were employed. It had never been reduced to the rules of grammar, and no book had ever been composed in it. It was, in short, not a literary language or a fixed idiom, but a varying and uncertain jargon. The Bible, the book for all, was only known by name.

Mavrocordato, assisted by one or two of the more intelli-

gent of the Wallachians, set diligently to work, and in the first place formed an alphabet out of Greek and Sclavonian characters, which was adapted to the wants of the composite language. He then drew up a regular grammar, and had it and a few other elementary books neatly printed. He caused the Bible to be translated, he distributed many copies of the Old and New Testament in the newly-formed written language, and ordered that the Evangelists should be regularly read in all churches. In a short time the upper classes of society generally knew how to read and write in their own language, and began to turn their attention to books; and as knowledge, the blessed element of the soul of man, like water that sustains his body, will not be kept in the high places unless dammed up by artificial means and force, but seeks the valley and the lowest places flowing in all directions, so did a portion of these acquirements gradually descend from the boyars or nobles to the simple citizens and industrious Wallachians and Moldavians. If, unhappily, the progress made has not been equal to the promise of the beginning,—if ignorance and sloth still assert their reign, the circumstance is owing to the tyranny of the Turks and to the constantly troubled state in which the two weak provinces have been kept by war, or brute force, or intrigue. Constantine Mavrocordato was a man formed to civilize an empire, but he could only act on a narrow and dependent theatre. He had the Turks of the last century for his masters, and he had no successors like himself to continue the good work. Let there be honour to whom honour is due! Such individuals, be the measure of their immediate success what it may, are entitled to our reverence whenever and wheresoever they spring up. The names of the inventors of an alphabet or of the devisers of a new written language, ought to be enregistered in a holy rubric, like those of the saints and martyrs of old!

Constantine Mavrocordato was twice recalled by the Porte as a wholly unfit instrument for the sultan's purposes; but he nobly persisted, at the hazard of his life, in doing all the good he could, and in labouring for the civilization of the Wallachians. Many of his laws and institutions, though often set at nought and trodden under foot, still survive to attest the soundness and purity of his system.

The Greek hospodars were permitted by the sultan to have a court, to confer titles of nobility, and to rejoice in the vain trappings of monarchy, but they were expressly prohibited from maintaining an army, or ever raising and assembling troops of any kind. In less than a century (during which period the principalities were occupied four several times by the Russians), forty hospodars succeeded one another in Wallachia alone. Thus, on an average, the reigns of these princes did not last longer than two years and six months. Articles calculated to strengthen the hospodars, to render their change less frequent and arbitrary, and to diminish the evils suffered by the hapless population, were inserted in the treaty of Kaïnardji, when (in 1774) the Russians, after a four-years' occupation, restored the two principalities to the Turks; but they were not observed by the Porte, nor could Russia at every moment insist on their observance. An additional convention made in 1779, and an article which formed part of the treaty of Jassy in 1792, when Russia, after another long occupation, again gave up the principalities, and which article, provided that the sultan "should observe and religiously execute all that had been stipulated in favour of the two provinces of Wallachia and Moldavia," was equally disregarded by the sublime Porte. The hospodars were changed as often as ever, in spite of the stipulation that the sultan should never recall, or in any manner interfere with them, until they had completed seven years of government. In 1802, however, after long negociation and some threats the Russian minister at Constantinople induced the Porte to contract another engagement, which was, that the princes Ipsilanti and Morousi, who were just named for Wallachia and Moldavia, should not be recalled before the term stipulated, "unless they should be guilty of some offence which he (the Russian minister) or his successor, on an examination of the facts, should pronounce to be cause sufficient to justify their deposition." Thus Russia, who had declared herself the protector of the principalities in 1774, now, in 1802, assumed the right of being judge of the hospodars, and umpire between them and the sultan. But even this engagement was broken by the Porte, in about three years, suddenly recalled both Ipsilanti and Morousi without even a word of intimation to the Russian minister Another war ensued, and from 1806 to 1812 the arms of the czar again occupied Wallachia and Moldavia. In 1812, the memorable year of Buonaparte's Moscow campaign, peace was concluded between the Russians and Turks at Bucharest, the Emperor Alexander redelivering the principalities to the sultan, with the exception of that fine part of Moldavia which lies between the rivers Pruth and Dniester, which was formally ceded to him, and which has ever since been held by the Russians, whose frontier line in that direction is now the Pruth, and not, as formerly, the Dniester. The active negociator for the sultan on this occasion was the Greek prince Demetrius Morousi, who aspired to be hospodar of Wallachia, and who was suspected of favouring the Russians: but the responsibility, properly speaking, rested with Galib-Effendi, the Turkish Minister for Foreign Affairs, and Plenipotentiary at Bucharest, who signed and sealed the treaty, and who, from all that appears, might for the moment have saved Moldavia from dismemberment, seeing that the Russians, critically situated, and scared at first at the gigantic projects of the French, were in the greatest hurry to conclude peace with the Turks. The punishment, however, fell upon the Greek Morousi, and in the usual treacherous and detestable manner. After the conclusion of the peace of Bucharest he was living in Wallachia, expecting his nomination as hospodar, when he was informed by his friends at Constantinople, who advised him to take refuge in some Christian state, that the intrigues of the French agents (enraged at the recent peace) and a powerful faction in the divan were contriving his destruction. The Russians offered him a safe and honourable asylum, but the unfortunate man had a family in the capital, upon whom, in case of his evasion, he feared the Turks, according to their old system, would wreak their vengeance. He relied, moreover, on the pretended friendship of his superior Galib-Effendi, who, to excuse his own stupidity, had actually accused Morousi to the sultan, and determined to accompany that minister to Constantinople, where he could explain his part of the transactions. Accordingly, the Turk and Greek left Bucharest in the month of September. Nothing could exceed the warmth of Galib-Effendi's protestations of good will and affection, but, as soon as they arrived at the strong Turkish fortress of Rutschûk, on the southern side of the Danube, he ordered Morousi to be seized and carried straight to the grand vizier, who was still with the army at Shumla, and who, on the Greek's arrival at his threshold, without hearing a syllable of his defence, caused him to be literally cut to pieces with sabres and yataghans. Morousi's head was sent to Constantinople, and, with that of his brother Panayotti, who was accused of being his accomplice, was there exhibited for three days at the gate of the sultan's palace.

By the fifth article of the treaty of Bucharest, all former treaties and conventions relative to the privileges of Wallachia and Moldavia, were recognized and confirmed, and the sublime Porte engaged once more to change its mode of treating the hospodars and taxing the people of those countries.

The princes Caradja and Callimacki were appointed in October, 1812, from which time Sultan Mahmoud showed a disposition to observe the agreement that the hospodars should not be changed more frequently than once in seven years. He also agreed that the agents of the two princes, resident at Constantinople, should place themselves under the protection of the Russian embassy, and that their persons should be considered inviolable like those of foreign ambassadors. Calimacki actually reigned the full term of seven years in Moldavia, but in Wallachia the hospodar Caradja fled into Austria a year before the expiration of the term, fearing that if he returned to Constantinople the sultan would deprive him of the wealth he had acquired. After his departure, the provisional government he had appointed and many of the principal boyars united in petitioning the sultan to name no more Greek princes, but to leave the administration to the divan or senate of nobles, who would punctually cause all taxes to be paid, and the regal rights and authority to be maintained. But Mahmoud turned a deaf ear to these proposals, naming a Greek prince to succeed Caradja, and, in the following year, another Fanariote Greek to succeed Calimacki in Moldavia. It is possible, though not very probable, that these last appointed hospodars would have been left in their governments for seven years, but in 1821 the breaking out of the Greek revolution in the Morea, and the rash attempt of Ipsilanti in Wallachia, threw everything into confusion, and brought down a savage

destruction on the heads of the Greeks of the Fanar. In their rage and fear the Turks suspected every Greek, and no longer regarding treaties, or past services, or the voice of humanity, the sultan ordered the slaughter of all the heads of the hospodar families, and the other Greeks of Constantinople who had been employed in state affairs. The hospodar of Moldavia was first exiled and then strangled, and his kaïmacan, or lieutenant, beheaded. The kaïmacan of Wallachia was also seized in Constantinople and beheaded, after which his body, with the head placed between his legs, was exhibited for three days, having an inscription placed over it which commenced with these words: "Behold the odious carcase of Constantine Negri, Kaïmacan of Wallachia." With the exception of Chradja, who had retired in good time into Austria, and of a very few others who escaped from Constantinople concealed in foreign ships, all the leading Fanariotes were either put to death or sent into exile, with confiscation of their property.

These slaughters and persecutions did not terminate till towards the end of 1822. In the following year, the sultan having declared his Fanariote subjects for ever incapable of holding office, the Wallachians were authorized to elect a native boyar to be their hospodar. The choice of the nobles was, however, subject to the approval of the Porte. In this manner Nicholas Ghika was nominated, and took possession of the principality in 1823.* Ghika, though born and in part brought up north of the Danube, was connected by marriage with the noblest Fanariote families, and was altogether more a Greek than a Wallachian. A prince was chosen in the same manner for Moldavia, and both were to remain seven years, at the very least. But five years had not passed when both the principalities were again occupied by the Russians, who, crossing the Pruth at the opening of the campaign of 1828, became masters of them without firing a musket. When the armistice of Adrianople was concluded between the Turks and the Russians on the 29th of August, 1829, the principalities were, for the present, left as a pledge in the hands of the latter power, and so they remained in 1833, when the sultan, after calling a Russian fleet and army to protect him against the Pasha of Egypt, by an article in the definitive treaty of Hunkiar-Iskellesi, confirmed to the Emperor Nicholas the possession of Wallachia and Moldavia as security for the debt owing by Turkey to Russia. At the same time Nicholas obliged Mahmoud to recognize him as "protector" of the Servians, who are nearly of the same race as the Wallachians and Moldavians, and profess the same religion. However jealous we may be of Russian encroachment, we ought not to conceal the fact that the condition of Servia and the two principalities has been much improved by these circumstances, without which we are quite confident the important advantages we are about to relate would not have been obtained for the present, as in all other matters the Ottoman government persists in maintaining the great monopolies, though it has made a parade of abolishing a few insignificant ones. In saying this, we would not imply that Russia, who acts on the anti-free-trade system at home, has advocated liberty of trade in all its branches in the principalities; but what we mean is, that she has produced a position of affairs that has favoured the representation of *others*, and made the sultan really anxious to conciliate the affections of his nearly-lost subjects by restoring to them the most important of their rights. As soon as the Turks had entirely destroyed the independence of the Wallachians and Moldavians, they monopolized the produce of their soil, which was bought up by the Porte at its own arbitrary price, for the consumption of Constantinople, the constructing and supplying the Ottoman fleets, &c. &c. The proprietor, or farmer, was allowed no other market, and was often obliged to sell his produce to the Turks for the third part of what he could have got in the foreign markets of Europe, had he enjoyed the rights of exportation and free trade. Everything not consumed in the country was absorbed by the Turkish capital. Corn, cattle, sheep, timber, masts for ships, hemp, tallow, hides, wax, honey, butter, cheese, which are all abundant, and which may be produced in vastly increased quantities under a different system, were all bought up at the prices government chose to put upon them for Constantinople, while wool, and a few minor articles which the Turks did not want—as rabbit-skins and yellow berries—were the only things allowed to be exported elsewhere free of export duties. In seasons of extraordinary abundance, which could seldom happen under such an odious monopoly, as people naturally diminish their production when they cannot freely and advantageously sell what they produce, the Porte, having first helped itself to all it wanted, sometimes allowed the Wallachians and Moldavians to dispose of their surplus to foreign traders; but even in these cases there was a tedious and expensive process to be gone through, and the exportation of corn (the main produce of both principalities) was constantly prohibited.

This was the great curse of the principalities, which more than anything kept the mass of the people in wretchedness, indolence, and beggary; and this curse, we are happy to say, was greatly mitigated or altogether removed last year. The Wallachians and Moldavians are now allowed to sell their corn, cattle, timber, &c. to the highest bidders; the monopoly of the Porte is destroyed, and foreign merchants begin to trade directly (by means of the Danube) with Moldavia and Wallachia. In consequence of these measures the price of provisions has risen considerably in Constantinople, where the Turks are now obliged to supply themselves with their meat and bread chiefly from their provinces of Asia Minor. According to Mr. William Wilkinson, who was British consul in Wallachia about fifteen years ago, the principalities annually furnished the Turkish capital with 1,500,000 kilos or bushels of wheat, 250,000 sheep, 3000 horses, and a vast number of bullocks.

Galatz, a town which at present does not contain above 8000 fixed inhabitants, is destined by nature to be the chief port of both principalities. It is in Moldavia, but close on the frontiers of Wallachia, being sixty-five miles from Jassy the Moldavian, seventy-five miles from Bucharest, the Wallachian, capital, and about sixty miles from the mouth of the Danube and the Black Sea. Up to that point the Danube is navigable, even to ships of three hundred tons burden; and as there is no tide, vessels can lie alongside the quays of Galatz and land or take in their cargoes in the most convenient manner possible. The place has nearly every advantage of the best of sea-ports, and may probably, at no very distant time, rival even that of Odessa in the Black Sea. Ibraïl, on the Danube, is equally well situated, and at these two towns several Genoese, French, and other speculators have already established themselves. A commercial house of great importance which has branches at Constantinople, Leghorn, Genoa, and Marseilles, has begun active operations at Ibraïl, where the first English vessel arrived in the autumn of last year, only a few months after the trade was thrown open*. An English house is about to establish itself at Bucharest with branches or agencies on the Danube for the direct importation of British manufactures and colonial articles, and the exportation of tallow, timber, and particularly staves for casks, &c. which are attainable at very low prices, in great quantities, and of excellent quality.

For a long series of years both the principalities drew their cotton and woollen goods, their glass, crockery-ware, hardware, and their manufactures generally, from Austria and Bohemia. To obtain a higher price for them the native and Greek merchants were accustomed to call most of the articles English. Some bales of our goods shipped at Smyrna and sent up the gulf of Enos, found their way over land by Adrianople and the Balkan mountains to Bucharest and Jassy; but like others bought at Constantinople and forwarded by caravan, the expenses upon them became very heavy, in addition to which, though duties had been paid by the original importer at the Turkish ports, fresh and heavier duties were levied before they could be introduced into the principalities.

The only serious drawback on the navigation of the Danube as far as Galatz is, that the river is blocked up with ice during a part of the year, and is in very severe seasons frozen over, from the end of November to the beginning of March. This inconvenience is, however, common to the ports of Odessa and Taganrok, on the Black Sea, and, of course, will always enter into the calculations of the navigator.

The principalities of Wallachia and Moldavia united are about 360 miles in length from Orsova to the Pruth, and about 150 miles in breadth from the Danube to the Crapaks or Carpathian mountains which separate them from the Austrian provinces of Temeswar, Transylvania, and the Bucovine. The face of the country is greatly varied: the upper part near the mountains, which produces an immense

* The English flag had been carried on the Danube for many years before by our subjects or protegés, the Greeks of the Ionian islands, but their craft were small, and their traffic unimportant.

quantity of fine timber, is picturesque and healthy, but the lower portion is exceedingly flat and dull, and in many places marshy and insalubrious. The bank of the Danube, to a great breadth inland, is a complete swamp, particularly in Moldavia. Capital and industry might reclaim much of this waste land, but at present not a sixth part of the productive soil, that requires nothing but the plough or spade, is under cultivation. The mountains are supposed to abound in mineral wealth, but they have never been properly examined. The roads are few and bad, but several streams which descend from the Carpathian mountains might easily be made available for the transport of timber and other commodities to the Danube. Bucharest, the capital of Wallachia, which is built on the river Domnitza, that falls into the Danube below Rutschuk, is one of the most disagreeable, swampy, unhealthy cities a man can live in. It has, however, a population of about 85,000, and there are many pleasant tracts of high wooded country and dry soil at the distance of a few miles from it. Jassy, the capital of Moldavia, which contains about 42,000 inhabitants, is, on the contrary, well built, delightfully situated, clean and healthy. The whole population of the two principalities is estimated at 1,500,000, but no correct census has ever been taken. Moldavia only enters for a third in this estimate, her inhabitants being set down at 500,000.

The character of the Wallachians and Moldavians has at present few points to recommend. The peasants are mild and inoffensive, but timid, spiritless, and indolent; the nobility and gentry, who live crowded in the capital cities, though exempt from all the fiercer vices, are vain, frivolous, voluptuous, corrupt, greatly addicted to gambling, and miserably educated. Next to education the great defect of high and low is a want of energy and courage. And yet these people are a mixture of the ancient Roman and the Sclavonian blood, and were once famed for their warlike independent spirit.

Whether we look at the limited population, the geographical position of the country, or the character of the inhabitants, we can see, *as yet*, but sorry materials for the building up of a nation, and we confess we cannot understand the speculations of some of our newspaper politicians who talk of erecting the two principalities into one separate independent state, which shall not only maintain itself but (being placed between the two) shall serve as a barrier to Turkey on that side against Russia. As to the latter point it would be just as rational to think of defending a stone castle by placing a line of wooden huts and straw sheds between it and its assailants.

The guarantee of England and France (for we fear Austria would not become a party to the arrangement) might indeed do much to sustain the tranquillity of the two provinces, and the improvements we have alluded to in this article; and the sultan, by leaving the Wallachians and Moldavians to themselves, or only exacting a moderate annual tribute, would certainly remove one of the great causes of dissension between him and his too powerful neighbour the czar. For many years, whenever Russia wanted to pick a quarrel with Turkey, she could find ostensible and, in many instances, just and popular motives for so doing in the sultan's treatment of the principalities and his infringement of the treaties that regarded them. The governments of the two principalities are now left to the hospodars and the divans or senates. This was nominally the case before the recent changes, but at present, as the hospodars are not shackled by the Turks, and as the senates are much less subservient to the hospodars, the administration proceeds in a more constitutional and just manner. Formerly the divan of each principality consisted of twelve boyars or nobles, who were presided and *nominated* (except the archbishop, who sat in right of his ecclesiastical dignity) by the reigning hospodar. These divans, by law, were to assemble twice a week, but the princes often dispensed with them for months together, and imposed taxes and raised money without even consulting them, although the constitution expressly declared that no such act could be legal unless it carried the approbation and signatures of the majority of the members of the divan. If we have been correctly informed, the number of members has been recently increased in both governments, and a few non-noble and mercantile men admitted into the divans.

In Wallachia, which is by far the more important of the two principalities, the Greco-Wallachian Ghika, who was hospodar at the breaking out of the war with Russia in 1828, has been restored to power to the great satisfaction of the people. Although not distinguished by great abilities, he is an honest, well-meaning man. We do not know who rules in Moldavia, or whether any hospodar has been elected there.

In all his late transactions in this part of the world, the czar has made a great *show* of moderation. So far from the sultan's having paid the debt owing to him, and for which debt the two principalities were pledged, he has not even made the first instalment, concerning which, as we mentioned in the last number of the 'Companion,' a curious dispute has arisen. In spite of these circumstances, however, Nicholas pretends to have withdrawn his troops from Wallachia and Moldavia. But how stands the fact? simply thus: a fine, picked garrison of 9000 Russians is left in possession of Silistria, the strongest Turkish fortress on the right bank of the Danube; a military road with stations and detachments is kept open through the principalities from Silistria and the Danube to the Pruth and Bessarabia, where Nicholas maintains a corps-d'armée on his own territory; and last, not least, a Russian consul-general, fixed at Bucharest, influences or absolutely directs many of the proceedings of the local governments, and keeps up a party in the divans of both principalities. These affairs seem to us of sufficient moment to call for the presence of an able and honest British resident; but the only agent we have, of any kind, on the spot, is a certain Signor Lovi, an Italian of whom nobody appears to know anything. Ever since the treaty of Bucharest, in 1812, the inhabitants, but more especially the popular mass, the *people*, properly so called, have been accustomed to look to the Russian consul for the redress of their grievances; and this, added to their religious sympathies (for they are of the same church as the Russians), to the sympathies which arise out of community of race (for Wallachians, Moldavians, and Russians, all spring from the great Sclavonian family), to the similarity of language, and to other circumstances, must always render the influence of the czar's agent very great.

Although deficient in some recent points, about which we have not been able to obtain correct information, and although necessarily concise, we hope these remarks will convey to our readers some notion of the much neglected principalities of Wallachia and Moldavia, and of the benefits which have lately been bestowed upon them.

EXPENSIVENESS OF IMPRISONMENT FOR SMALL DEBTS AND SMALL DELINQUENCIES.

Two very important returns, headed BATH GAOL, have just been laid before Parliament. They illustrate, in a very striking manner, the expensiveness of imprisonment for small debts and petty infringements of police regulations.

The first is entitled "A Return of the persons committed to Bath City Gaol from March, 1833, to March, 1835, by order of the Local Courts of Request; stating the amount of the debt sued for, and the cost incurred in each case; the maximum and minimum number of days for which each person might have been imprisoned, and the number of days each person was sentenced to be imprisoned."

The return, as made up, does not altogether fulfil the promise of the endorsement. One year only, namely, 1833, is given; and the maximum and minimum punishments attached to each amount of indebtedness is omitted. Nevertheless quite enough is furnished to exhibit, in strong relief, the feature indicated by the title of this article.

The total number of commitments in the year 1833, including some few double commitments of the same individuals, is 310. Their debts range from the trifling sum of 2*s.* 2½*d.* up to 10*l.*, beyond which sum the jurisdiction of the court does not reach. The total amount of the debts of these 310 persons is 929*l.* 17*s.* 4½*d.* The total amount of costs on the processes of summons and commitments is 282*l.* 11*s.* 7*d.* The scale of imprisonment is as follows:—

Debts under 20*s.*, 20 days; from 20*s.* to 40*s.*, 40 days; from 40*s.* to 3*l.*, 60 days; from 3*l.* to 4*l.*, 80 days; from 4*l.* to 5*l.*, 100 days; and from 5*l.* to 10*l.*, 200 days.

The total number of days of labour lost to the community by the imprisonment of these 310 persons is 23,200; the average length of imprisonment suffered by each being 75 days.

Estimating the average wages of these poor debtors at 15*s.* per week only, or 2*s.* 6*d.* per diem when at large—for

in gaol, be it remembered, they earn nothing—we have a sum of 3000*l.* to be added to the costs previously stated, and the two together will indicate the diminution of public wealth resulting from the custom of imprisonment for small debts in *one only* of the many gaols in the kingdom. Let us bring these facts more immediately before the eye:—

No. of Debtors.	Costs.	Debts.	Days' Imprisonment.	Value of Labour, 2*s.* 6*d.* per Diem.	Loss of Labour and Costs.
	£. *s.* *d.*	*£.* *s.* *d.*		*£.* *s.* *d.*	*£.* *s.* *d.*
310	329 17 4½	288 11 7	23,200	2,900 0 0	3,183 0 0
Average	1 0 0	0 18 8	75	9 7 6	10 5 0

But these averages do not indicate the most grievous cases. Take a dozen of the smallest accounts, and the mass of evil incidental to the system will be strikingly apparent.

Names.	Debts.	Costs.	Value of Labour lost.
	£. *s.* *d.*	*£.* *s.* *d.*	
H. Pettinger	0 2 10	0 6 5	All sentenced to twenty days' imprisonment; supposed value of their labour at 15*s.* per week, 30*l.*
G. Dagger	0 3 0	0 6 5	
W. Rolls	0 3 6	0 6 5	
W. Dickenson	0 2 9½	0 6 5	
C. Baker	0 4 2½	0 6 5	
J. Dickenson	0 2 6	0 6 5	
J. Trigg	0 4 10½	0 6 5	
E. Brown	0 2 0	0 6 5	
W. Boyce	0 2 6	0 6 5	
E. Wells	0 4 4	0 8 3	
E. Marshmen	0 2 2½	0 6 5	
J. Thomas	0 2 6	0 6 5	
Total	1 17 3	3 18 10	30*l.*

Here we have the costs of proceedings upwards of 200 per cent., and the aggregate punishment estimated in money more than sixteen times the offence. In the extreme case the costs exceed 300 per cent., and the whole punishment is twenty-eight times as great as the offence. Surely reform is wanted here if anywhere.

We have made use of the word expensiveness to stand only for the cost and loss estimated in money; but we have the authority of more than one great jurist for including within the term more than mere pounds, shillings, and pence. Let the reader mark down the loss of health incidental to seventy-five days' confinement in a crowded and often filthy gaol, and to an insufficiency of clothing and food; let him also mark the baneful moral effect of such imprisonment, and then let him say if the "expensivenesss," in the more extended meaning of the term, be not almost beyond calculation.

We now turn to the second document—"A Return of the persons committed in the years 1832, 1833, and 1834, to the Bath City Gaol for want of bail, and for offences committed under local police acts; stating the amount of bail demanded, and the specific offence charged in each case; the age of each person, the number of days during which each person was imprisoned, and the prison debt ordinarily allowed."

The following is a catalogue of the offences exhibited on the face of this return, together with the numbers punished for each description of offence:—

Aggravated assault	1
Assault	1
Threatening assaults	8
Bastardy	3
Misdemeanour	2
Disorderly house	2
Rescue	2
Breach of the peace	62
Exposing fruit, &c., for sale on the pathway	63
Collecting ashes from houses	1
Total	145

The most striking feature in this return is the utter disregard to any the slightest proportion between the offence and the punishment. To the case of assault we find attached thirty-six days' imprisonment, whilst to a threat of assault, which cannot be so heinous an offence as the act itself, is assigned, in one case, eighty-four days' imprisonment.

The two cases (a man and his wife) of "keeping a disorderly house"—a hot-bed of vice and misery—a fruitful source of wretchedness and guilt—the justices seem to look leniently upon, ten days' imprisonment only being inflicted upon them; whilst "selling fruit on the pathway," a crime having in it no immorality whatever, although it may obstruct the chairs of the Bath dowagers, is punished with no less than thirty days' incarceration. But even this difference between the figures 10 and 30 by no means indicates the proportionate punishments. The keeper of a brothel is a being dead to every sense of decency and shame. To him or her it is simply a few days' confinement. They are not robbed of the slightest consideration among their usual associates, with whom on the contrary, they find sympathy. They are "in trouble," and every effort is made by their friends to alleviate the tedium of their few day's detention. Contrast this with the following cases of persons imprisoned for selling fruit on the footpath, which we take, without selection, in the order in which they follow each other on the lists:—Fanny Bray, aged 15; Ann Palmer, aged 17; Amelia Beard, aged 16—sentence, thirty days. Most of those committed for this "crime" are under twenty years of age. There is no reason to suppose them of abandoned character. Indeed, the simple fact that they resort to an honest though humble means of obtaining a livelihood is a presumption that they are neither prostitutes nor pilferers, though assuredly under the Bath police regulations they are likely to be made both.

To such persons thirty days' imprisonment in a common gaol is in most cases ruin. We know nothing of the economy of the Bath City Gaol in particular, but we know this of our gaols in general, that there is no classification and separation of offenders. The young female of fifteen, convicted, not of any breach of positive morality, but merely of an offence against aristocratic convenience, an offence against the free passage of sedan chairs!—is shut up perchance in the same room with the hardened dealer in female seduction. The two "keepers of a disorderly house," imprisoned for ten days, would thus be enabled to turn their "trouble" to good account. A constant supply of victims is provided for them, and their committal ceases to be a punishment. This is a revolting picture, but it is a faithful one.

Besides the moral and political objection to visiting such offences with so injurious a mode of punishment, there is in these cases the same politico-economical objection—if we may be allowed the expression—which we have pointed out as incidental to imprisonment for small debts. The average imprisonment inflicted on the "sellers of fruit on footpaths" is 15¼ days. Estimating their labours at the low rate already assumed in the former case, it is equal to a penalty of nearly 2*l.* on each of the unfortunate persons convicted.

We should be glad to see a similar and even a more extensive return for every gaol in the kingdom. Such a set of documents would show an annual loss in impeded labour alone of between 1,000,000*l.* and 2,000,000*l.* Considered with respect to the destruction of morality and the promotion of crime, the picture would be perfectly frightful, though, to the legislator, most instructive.

THE REPUBLIC OF NEW GRENADA.

New Grenada comprises the whole of the north-western part of the late republic of Columbia, from which it was separated in the year 1831. The territories of New Grenada extend from the equator to Cape La Vela, in about 12° of north latitude, and between the parallels of 72° and 81° of longitude, in their greatest breadth.

The republic of New Grenada is divided into five departments, containing nineteen provinces, with a population of altogether 1,340,000 inhabitants, viz.:—

1. Department of Cundinamarca, capital Bogota, containing the provinces of Bogota, with 175,000 inhabitants; Antioquia, 105,000; Mariquita, 45,000; Neiva, 50,000.

2. Department of Boyaca, capital Tunja, containing the provinces of Tunja, with 200,000 inhabitants; Socorro, 150,000; Pamplona, 75,000; Casanare, 20,000.

3. Department of the Magdalena, capital Carthagena, containing the provinces of Carthagena, with 130,000 inha-

bitants; Santa Martha, 60,000; Mompoz, 50,000; Rio Hacha, 10,000.

4. Department of the Cauca, capital Popayan, containing the provinces of Panama, with 50,000 inhabitants; Veragua, 30,000.

The principal rivers are the Magdalena, Atrato, Cauca, and the branches of the Orinoco, running into the province of Boyaca.

The sea-ports on the Atlantic, or north side, are those of Rio Hacha, Santa Martha, Savanilla, Carthagena, Porto Bello, and Chagres, with Panama, Choco, and Buena Ventura in the Pacific.

The exports from New Grenada consist chiefly of cottons, fustic, Nicaragua wood, hides, and a few drugs; neither cocoa, coffee, nor sugar are produced in sufficient quantities to supply the home demand. Tobacco is a monopoly of the Government, and the quantity raised is inadequate for the consumption of the country. The remainder of the imports from abroad are paid for in specie and gold dust, which latter is however exported clandestinely. The whole value of the produce of the soil of New Grenada, according to official documents made up for the year ending 30th June, 1834, was estimated to amount to 3,250,000 dollars, or 650,000*l.* sterling.

The number of vessels which entered and sailed from the ports of this republic during the above-mentioned period was 360. The value of goods imported was 360,000*l.*, and of those exported, 310,000*l.*, whilst the duties levied on the same returned about 130,000*l.* to the Treasury.

The revenues of New Grenada, in 1833, are stated to have produced an income of about 500,000*l.*, whilst the expenditure amounted to about 450,000*l.*, exclusive however of any interest on the foreign debt, leaving an apparent surplus of 50,000*l.*, the greater part of which sum was employed in the purchase of tobacco.

No late statement has been made respecting the amount of the domestic debt due by New Grenada, but it is probably not less than three millions of dollars, as in the estimate of expenditure for the last year there appears an item of 150,000 dollars, appropriated towards the redemption of the floating debt due at the various customhouses, equal to five per cent. on the above amount.

The estimate of expenditure for the year ending June last was 2,657,000 dollars, (or about 530,000*l.*,) also exclusive of any interest for the foreign debt, whilst the receipts, including the balance on hand in June, 1833, were calculated at 2,530,000 dollars (or 507,000*l.*)

The whole amount of the foreign debt now remaining due by the late republic of Colombia is about 6,626,000*l.* sterling, whilst the arrears of interest accumulated on the same up to the close of last year exceed 3,300,000*l.*, forming a total of nearly ten millions sterling. According to the arrangements proposed at the meeting of the deputies from the three states at Bogota, in January last, the repartition of the debt is to be as follows, viz.:—New Grenada to bear 50 parts; Venezuela, 28½ parts; the Equator, 21½ parts; in which case the portion due by New Grenada, including the arrears of interest, would amount to nearly five million sterling, which sum, at six per cent. interest, would require an annual provision of at least one and a half million of dollars, or rather more than half the amount of the entire present ostensible income of the state.

The branches of revenue appropriated by the late government of Colombia for providing the interest and sinking fund on the foreign debt, were as follows, viz.:—One-eighth of the duties received at the different customhouses; the whole of the duties levied on gold and silver; and, lastly, the revenues arising from the tobacco monopoly.

In the original contract, however, for the foreign loans, it was stipulated that one-half of the duties received at the different customhouses should be set apart for the payment of the dividends, although by a subsequent decree this quota was reduced to one-eighth. These duties amounted last year to about 640,000 dollars, one-eighth of which would have been 80,000 dollars; the duties on gold and silver appear to have produced only 36,000 dollars, while the net returns from the tobacco revenues did not yield more than 206 000 dollars, making altogether about [illegible] dollars, or 64,000*l.* sterling, equal to a dividend of about one and two-sevenths per cent. on the portion of the foreign debt due by New Grenada.

The duties at present levied on imports are far too high, being equal to nearly 33½ per cent. on the value of the goods imported, and only tend to encourage smuggling, whereas if they were reduced to a moderate per centage, on a fixed tariff, rated according to the fair cost of the article at the place of production, and proper persons appointed with sufficient salaries, some check might no doubt be given to the system of smuggling and fraud now carried on in almost every part of Spanish America, equally injurious to the revenues of a country and to the fair trader.

The greater part of the gold found in New Grenada is obtained from washing the auriferous soils. The quantity so produced, under the dominion of the Spaniards, appears to have been very considerable, but at present most of the gold dust collected in this country finds its way abroad clandestinely, without paying any duty. The duties on coinage at the mints of Bogota and Popayan, produced, in 1834, about 75,000 dollars.

A very considerable quantity of platina is found in the province of Choco, the sale of which is, however, monopolized by the Government at the rate of six dollars per ounce, more than double its real value; the greater part, consequently, finds its way abroad clandestinely. If proper facilities were, however, granted for the export of platina as well as of the other precious metals, greater quantities would no doubt be raised, and trade increased in proportion.

The monopoly of tobacco used to form one of the most lucrative branches of the revenues of Columbia. The Government of New Grenada has continued the monopoly of this article; and its cultivation can therefore only be carried on in particular districts by persons licensed for that purpose. The whole of the tobacco must be brought to the various depôts, where it is sold to the agents of the Government at such prices as the latter think proper to fix. In the maritime provinces the average price paid for tobacco of the first quality is about 9*d.* sterling per pound, and in the interior about 6*d.*, while it is generally resold to the dealers at 2*s.* 6*d.*, and in some places as high as 3*s.*

On the first establishment of their independence, the Government of Columbia abolished all monopolies. It was, however, deemed advisable to resume that of tobacco, with the ostensible object of applying the receipts to the liquidation of the public debt. Various decrees were passed in consequence, for giving greater encouragement to the cultivation of this article. They have, however, failed in producing the desired effect, and the production of tobacco has so much decreased that it now barely suffices for the consumption of the country.

The causes to which the Minister of Finance attributes the great falling off in this branch of the revenue, are the want of sufficient funds on the part of the Government to enable them to supply the directors of the different establishments with means to purchase the quantity required for public consumption, and the extensive smuggling carried on in the article, owing to the price put on it being so disproportionate to its real value. Out of the loans raised in England in 1824, about 500,000 dollars were appropriated in supplying the different tobacco depôts with funds, but the Minister states that three millions of dollars at least are necessary to enable the Government to derive full benefit from this monopoly.

The capital at present employed by the Government of New Grenada in this branch, amounts to between 300,000 and 400,000 dollars; its net revenues in 1832 were 184,000, and in 1833, 206,000 dollars; but the receipts for 1834 were not expected to produce more than 175,000 dollars.

The Minister now proposes to allow the growers a better price for their tobacco; but it would probably be very difficult to induce independent capitalists to engage in the culture of this article so long as they are restricted from selling their produce in the best market, and are at the same time subjected in all their operations to the vexatious interference of the officers of the revenue.

If, on the other hand, the monopoly were given up altogether, and the grower left at liberty to cultivate and dispose of his produce, paying only a moderate duty on the crop, somewhat after the plan adopted in England as to the growing of hops, there can be little doubt but tobacco might be made to produce a very considerable revenue to the state, and the article afforded much cheaper and of a better quality, while the consumption would increase in proportion. Under the present system the growers are badly paid for their labour, and have but little inducement either for improving or extending the cultivation, whilst the high price affords every temptation for contraband importation.

The soil and climate of New Grenada are well adapted for the growth of tobacco in almost every part, but the quality most preferred for exportation was that grown in the province of Varinas, now belonging to Venezuela.

The trade between Great Britain and the different parts of the late republic of Columbia is principally carried on from Liverpool. The total value of exports from the United Kingdom to Columbia, in 1833, amounted to 500,000*l.* sterling, only about one-third of which probably went to ports in New Grenada, whilst the imports from Columbia, exclusive of gold and silver, did not exceed 25,000*l.*

The cotton produced in New Grenada is generally known under the name of Carthagena cotton, and is worth from 6*d.* to 7*d.* per pound. It is of a middling fine staple, but badly cleaned, being very dirty and full of seeds. The quantity imported into Liverpool every year averages from 6000 to 8000 bales, of about 120 pounds each. The growth of this article might however be considerably increased, and it might form the staple produce of the country if greater attention were paid to its culture and preparation.

The demand for fustic has considerably improved of late years. This article is principally shipped at the port of Savanilla, being cut on the banks of the river Magdalena. It is of a tolerably fair quality, and sells for about 5*l.* a ton.

The demand for Rio Hacha Nicaragua wood, on the other hand, has greatly decreased, owing to the large quantities of this dyewood brought round Cape Horn from the western coast of Central America, where it can be procured of a better quality, and, from growing near the sea, at a far less cost. The hides received from New Grenada are chiefly shipped at Santa Martha, being the produce from cattle reared on the banks of the river Magdalena. They are mostly sent in the wet salted state, and are worth about 4½*d* per pound.

The principal drugs produced in New Grenada are balsam of tolu, sarsaparilla, ipecacuanha, and a little bark. The three last, however, are generally very inferior in quality, and the value of the whole is but trifling.

Particulars of the revenues of New Grenada in 1833 :—

	Dollars.
Import duties	650,000
Export ditto	13,000
Excise ditto	328,000
Salt monopoly	254,000
Tobacco ditto	548,000
Tithes	120,000
Spirits	120,000
Mint and coinage	110,000
Gold and silver	36,000
Stamps	34,000
Post office	93,000
Miscellaneous	101,000
	D.2,407,000

Particulars of the expenditure of New Grenada for 1834 :—

Home department.	Expenses of congress, &c.		60,000
,,	Executive power		36,000
,,	Justice and education		18,000
,,	Hospital, pensions, &c.		43,000
,,	Expenses of the provinces		220,000
			D.377,000

ABSTRACTS OF PARLIAMENTARY PAPERS.

Metropolitan Police.—The receipts of the Metropolitan Police for the year 1834, amount to 218,141*l.* 19*s.* 9*d.*; the disbursements to 215,108*l.* 7*s.* 6*d.*

British Museum.—The number of persons admitted to view the British Museum from 1829 to 1834, inclusive, has been as follows :—

1829	1830	1831	1832	1833	1834
68,101	71,336	99,912	147,896	210,495	237,366

Number of visits paid to the reading-room for the purposes of study or research :—

1810	1815	1820	1825	1830
1,950	4,300	8,820	22,800	31,209

1831	1832	1833	1834
38,200	46,800	58,800	70,266

Visits by artists and students to the galleries of sculpture :—

1831	1832	1833	1834
4,938	4,740	4,490	5,645

Visits to the print-room :—

1832	1833	1834
4,400	2,900	2,204

Receipts and expenses for 1834 :—	£	*s.*	*d.*
Receipts	18,825	4	9½
Expenses	18,577	1	6
Surplus in hand	248	3	3½
Estimated expense for 1835	17,796	0	0

Coals.—An account of the quantity of coals brought coastwise and by inland navigation, into the port of London during the year 1834, compared with the quantities brought during 1833 :—

Ships. 1833	Ships. 1834	Ports whence Shipped.	Tons. 1833	Tons. 1834
3,387	3,625	Newcastle	1,060,839	1,142,903
2,369	2,036	Sunderland	666,787	559,105
773	1,007	Stockton	170,690	221,971
178	248	Blythe & Seaton Sluice	48,689	64,268
67	176	Ports in Scotland	15,138	39,487
130	135	Places in Wales	32,156	33,200
173	177	Places in Yorkshire	16,110	17,751
		Quantity which passed the Boundary Stones on the Grand Junction Canal, &c.	4,395½	1,862
7,077	7,404		2,014,804½	2,080,547

Police Gazette.—Cost of printing and circulating :—

		Number Printed.
1830	£1,365	148,100
1831	1,577	169,750
1832	1,535	167,560
1833	1,596	156,832
1834	1,612	161,200

In addition to the items of expense, the editor has a salary of 100*l.* per annum. The 'Police Gazette' is sent to the mayors and principal officers of every city and town in the kingdom, to justices of the peace in petty sessions assembled, or their clerks, the keepers of gaols, and houses of correction, the metropolitan police, the war-office, horse-patrol, police offices, the commanding officers of each regiment, and the several military depôts in Great Britain.

Sale of Beer Licenses.—Account of the number of licenses granted under the sale of beer act, during the years 1833 and 1834 :—

	1833	1834
Retailers of beer, cider, and perry,	34,976	21,975
,, cider and perry only,	653	1,054
,, beer, porter, or ale, to be drunk on the premises,		13,654
,, not to be drunk on the premises,		1,752
	35,629	38,435

Private and Joint Stock Banks.—An account of the aggregate amount of Notes circulated in England and Wales, by Private Banks and by Joint Stock Banks and their branches, distinguishing Private from Joint Stock Banks, between the 27th of December, 1834, and the 28th of March, 1835 :—

Private banks	£8,231,206
Joint Stock Banks	2,188,954
	£10,420,160

Newspaper Advertisements.—A Return of the Number of Advertisements which appeared in each of the Newspapers published in London during the Years 1831, 1832, 1833, and 1834; and the Amount of Advertisement Duty paid by each during the period above-mentioned.

Note.—By 3 and 4 William IV., c. 23, the Duty on Advertisements was reduced, on the 5th of July, 1833, from 3*s.* 6*d.* to 1*s.* 6*d.*

National Vaccine Institution.—Annual Report.—The bills of mortality report only 334 deaths by small-pox in the metropolis during 1834; a number considerably less than have died in any year since the introduction of vaccination, and falling short by at least 4,000 of the average of deaths annually by small-pox, before the protecting influence of the cow-pox was discovered, and pre-maturely, even when the population of London was at least one-fourth less than it amounts at present.

Such a diminution of mortality by small-pox, it is fair to attribute to the now almost universal adoption of vaccination. The provident liberality of parliament has maintained the National Vaccine Institution in such authority and usefulness, as to enable it to answer every demand to supply the material of vaccination. During last year there were 42 applications from the navy; 34 from the army; 55 from foreign stations; and 107 from dispensaries established in various towns of the country.

There have been vaccinated last year of the poor, 11,571 at the Institution, and 83,191 charges of lymph have been sent out.

Report from the Standing Committee on the Library of the House of Commons, 1835:—

"I. *State of the Library.*—The first subject upon which the House will naturally expect to receive a communication from your committee, will be the state of the library as it was left by the fire of the 16th October, 1834. It is needless to state, that not only the rooms specially designated as The Library, but all the other depositories of books and papers belonging to the House, within the precincts of the ancient palace of Westminster, were, in that calamity, entirely destroyed. Nothing whatever was saved of that collection of MSS. to which the committee of 1832 had referred, as being found in the presses of the Long Gallery; not a single volume of that collection of tracts on English history, (a collection which may almost be said to have been discovered in 1832,) on the possession of which, Sir Henry Ellis, the chief librarian of the British Museum, in a letter to the then chairman of the library committee, congratulated the House (Appendix to Report, 1832, p. 37). Everything in the office of Clerk of the Journals perished in the same conflagration.

"All the books contained in the lower library were, with very few exceptions at least, thrown from the windows into Cotton Garden, on the night of the fire; and a large proportion have, in consequence, been saved; but the whole of the contents of the upper library, consisting of upwards of 2000 volumes, presented by the French government, and by the Chamber of Peers, and by the Chamber of Deputies of France, and of those purchased in pursuance of the recommendation of the Select Committee of 1832, together with a variety of historical books, which had formerly been placed in the lower room, but which the annual increase of parliamentary papers had necessarily excluded from that room, were destroyed by the fire.

"A duplicate collection of parliamentary papers, and a set of the private acts from the year 1754 to the present time, which were severally deposited in the committee rooms Nos. 20 and 21, above the library, were likewise destroyed.

"Of the volumes which were saved, many sustained, as might be expected, considerable injury and required re-binding.

"The books which were saved have been carefully sorted and examined; and all deficiencies in the parliamentary papers have been supplied, with the exception of a few of the earlier papers previous to the Union, which are out of print: and that department of the collection is now, with such exception, as perfect as it was before the fire.

"The other principal works of reference connected with parliamentary business are complete, and occupy nearly the whole space appropriated to the present library.

"With respect to the general collection in the library, it is difficult to ascertain with accuracy the exact extent of the loss which has been sustained; since the manuscript catalogue, which had been carefully compiled, and was ready for publication, and in which only were to be found the titles of the works purchased or presented to the library, since the completion of the last catalogue in 1829, was unfortunately burned. Nevertheless, as perfect a list as under present circumstances could be made, both of the books destroyed and of those saved, will be found in the Appendix [to the Report].

"The three manuscript volumes (in folio) of the catalogue of tracts on English history, have perished with the collection itself; and no evidence of the contents of that collection is now known to exist elsewhere.

"Your committee recommend that the original stock of the library, according to the catalogue of 1829, be, with such exceptions as may be found expedient, replaced, as furnishing a good and sufficient foundation for a parliamentary library of historical and constitutional information; and for this purpose they suggest that a sum not exceeding 3000*l.* be placed at the disposal of Mr. Speaker, in the hope that he will be pleased to give such direction as to ensure the collection of the books in question, being in readiness for the time when the new building may be prepared for their reception.

"II.—*Arrangements for the New Library; and for the Librarian.*—The next subject upon which your committee feel it to be their duty to report, is the arrangement for the new library.

"It will be in the recollection of the House that there was no library at all belonging to the House of Commons prior to 1818. In that year a room 17 feet 3 inches by 16 feet 9 inches, containing about 189 square feet, was appropriated by the late Speaker as a book-room for the use of members.

"The late library, which was built in consequence of a Report of the Select Committee of 1825, was 55 feet long, 23 wide, and 13½ high, containing about 1,265 square feet. Even this accommodation, though so greatly increased compared with that previously provided, was so limited, that the Library Committee, in 1830, reported on the necessity of enlarging the room. Their recommendation was not, indeed, immediately followed up; but in 1832, after consideration by the House of the Report of the Committee of that year, the rooms Nos. 18 and 19, being together of the same size as the library, were appropriated to the same general purposes; and an outer room, or lobby, was taken off the staircase of the lower library. The library, thus enlarged, occupied in length of floor 110 feet by 23 wide; and of course a double area, containing about 2,530 square feet, was thus provided, besides the outer apartment.

"It would be convenient in a new building that this extent of room should be on one floor. The Committee cannot enter on the suggestion of the dimensions and arrangements of a new building, without adverting to the fact, that in all previous Reports of the Library Committee, the anticipations of a progressive addition of books and papers have uniformly fallen short of the actual increase; and therefore it may become necessary, in the construction of a new building, to provide some means, either for extension of space, or for the adaptation of committee or other rooms, for the reception of additional books, as occasion may require."

[The Committee suggest, that in addition to the library, there should also be a room to be called the members writing-room; that as the fire has altered the expediency of appropriating a particular house for the librarian, which had been about to be carried into effect, the accommodation of a residence adjoining the library, in any new building, ought to be secured, suitable to a person of an income of from 500*l.* to 600*l.* a year, and that, until this accommodation can be secured for the librarian, he should receive an allowance of 120*l.* per annum, commencing with the present session. The remainder of the report is occupied by observations and suggestions relative to Indexes, &c, in which it is stated that the Index to Local Personal Acts, which had been all but ready for the Press, was consumed in the fire; but that, notwithstanding, the librarian should not lose the fair and legitimate payment for his work, which had been thus destroyed without any fault on his part; and it is recommended that a sum not exceeding 300*l.* be placed at the disposal of Mr. Speaker, in order to enable him to pay the librarian at discretion; that the correct Index to the Journals, which had been formed with a view of being printed every 20 years, was happily saved from the flames; and that as the labour of compiling each volume of this Index has increased, there be paid, (instead of 120*l.*, which had been paid in 1820,) the sum of 200*l.* per volume. It is also suggested that the accommodation in the present temporary buildings might be enlarged, as a strong desire has been expressed by many members for additional space.]

Printed Papers.—The Select Committee of the House of Commons on Printed Papers have agreed to the following Resolutions:—

1. *Resolved*, That it is the opinion of this Committee, that it is expedient that the whole number of copies of the statutes for promulgation be printed of one uniform size.

2. That it is the opinion of this Committee, that it is expedient that the Statutes for promulgation be of the royal octavo size, continuously printed.

3. That it is the opinion of this Committee, that the Statutes should be distributed to the Members of both Houses of Parliament by the vote offices, in the same manner as the parliamentary papers are now distributed.

4. That it is the opinion of this Committee, that it is expedient that the Statutes should be promulgated as soon after the completion of each sheet as possible.

Milbank Penitentiary.—Report of the Superintending Committee for the year 1834.

In consequence of the more strict mode of separation and seclusion of the prisoners in the General Penitentiary, which had been adopted as stated in the Report of the Committee for the year 1832, it was found necessary to subdivide the working cells of the male prisoners. This has accordingly been done under the sanction of the Secretary of State for the Home Department, upon an estimate submitted by Sir Robert Smirke.

The work was effected by contract for the sum of 485*l.* 13*s.* 6*d.* in pentageons Nos. 1 and 2, thereby giving an additional accommodation of 42 cells for solitary confinement.

Of the conduct of the principal officers, the Committee speak in

terms of high approbation. No cases of serious misconduct occurred amongst the convicts.

The number of convicts in the prison on the 31st of December, 1833, was 614, viz., 486 males, and 128 females: and on the 31st of December last, the number was 622, viz., 516 males, and 106 females; having been augmented during the year by the reception of 169 males, (of whom one was returned from the Criminal Lunatic Asylum, who had been sent there in a former year,) and 31 females, and diminished by the deaths of 15 males and one female; the discharge of 118 males and 50 females, (of whom 105 males and 33 females were by his Majesty's free pardon, and 13 males and 17 females on medical grounds); three males were sent to Bethlem Hospital, and three males and two females were remitted to the Secretary of State, pursuant to the 4th sect. of the Act 7 and 8 Geo. IV., c. 33, having been found incorrigible by the discipline of the Penitentiary.

Of the 15 males who have died during the last year, nine suffered from cholera morbus, one from influenza, and one from inflammation of the lungs. The female was carried off by consumption.

The general health of the prison throughout the year has been remarkably good, and of the number of convicts at present within the walls, being 596, viz., 492 males and 104 females, there are only in the infirmaries 14 males and two females, and no case of any material consequence among them.

In addition to the number of prisoners discharged in 1832, who had received gratuities for good conduct after quitting the prison, as reported last year, being 48 males and 17 females, 10 males and three females have since produced testimonials of character and behaviour so satisfactory, that the usual reward has been bestowed upon them.

Of those discharged in 1833, being 83 males and 53 females, 31 males and 20 females have received gratuities for good conduct since their liberation. The applications of three males have been refused, the Committee not deeming their conduct to be such as to entitle them to that mark of approbation. Two females have died since quitting the prison; nine males and five females are imprisoned again, or are known by the governor to have returned to evil courses: but of the remainder so discharged, being 40 males and 28 females, several are known to be going on well, although they have not yet applied for gratuities, which sometimes arise from a wish to conceal their former imprisonment, or other private reasons.

The earnings of the prisoners during 1834, amounted to 3016*l.* 4*s.* 2*d.* The total expense of the establishment, (including the repairs and alterations on the buildings) was 16,912*l.* 18*s.* 10*d.*

Diplomatic Service of Great Britain.—The following is the Official Return of the Annual Salaries and Allowances of each Ambassador, Minister Plenipotentiary, Envoy Extraordinary, Secretary of Legation, &c.. at the different Foreign Courts:—

Berlin.—Envoy Extraordinary, 5500*l.*; Secretary of Legation, 550*l.*; First Attaché, 250*l.*

Berne.—Secretary of Legation, 400*l.*

Bogota.—Envoy Extraordinary, 4000*l.*; First Attaché, 300*l.*

Brussels.—Ambassador, 2000*l.*; Secretary of Legation, 500*l.*; Attaché, 200*l.*

Buenos Ayres.—Secretary of Legation, 500*l.*

Constantinople.—Ambassador, 6500*l.*; Secretary of Embassy, 800*l.*; Attaché, 250*l.*

Copenhagen.—Envoy Extraordinary, 4000*l.*; Secretary of Legation, 500*l.*

Dresden.—Minister Plenipotentiary, 2300*l.*; Secretary of Legation, 400*l.*

Florence.—Minister Resident, 2300*l.*; Secretary of Legation, 400*l.*

Frankfort.—Minister Plenipotentiary, 2900*l.*; Secretary of Legation, 400*l.*

Greece.—Resident Minister, 2200*l.*; Secretary of Legation, 400*l.*

La Hague.—First Attaché and Chargé d'Affaires, 500*l.*

La Plata.—Minister Plenipotentiary, 3300*l.*

Lisbon.—Ambassador, 5000*l.*; Secretary of Legation, 600*l.*

Madrid.—Envoy Extraordinary, 6500*l.*; First Attaché, 600*l.*; Secretary of Legation, 550*l.*

Mexico.—Minister, 2000*l.*; Secretary of Legation, 900*l.*; Attaché, 200*l.*

Munich.—Envoy Extraordinary, 4000*l.*; Secretary of Legation, 500*l.*

Naples.—Envoy Extraordinary, 4400*l.*; Secretary of Legation, 550*l.*

Paris.—Ambassador Extraordinary, 10,000*l.*; Secretary of Embassy, 1000*l.*; First Attaché, 400*l.*

Rio de Janeiro.—Envoy Extraordinary, 4500*l.*; Secretary of Legation, [illegible]; First Attaché, 400*l.*

St. Petersburgh.—Minister Plenipotentiary, 6500*l.*; Secretary of Embassy, 1000*l.*; First Attaché, 400*l.*

Stockholm.—Envoy Extraordinary, 3300*l.*; Secretary of Legation, [illegible]00*l.*

[illegible]ard.—Envoy Extraordinary, 2200*l.*; Secretary of Legation, [illegible]00*l.*

Turin.—Minister Plenipotentiary, 4100*l.*; Secretary of Legation, 500*l.*

Vienna.—Ambassador Extraordinary, 9900*l.*; Secretary of Embassy, 900*l.*; First Attaché, 250*l.*; Attaché, 200*l.*

Washington.—Envoy Extraordinary, 5500*l.*; First Attaché, 200*l.*

Besides the above, there are twenty-five Attachés in the suites of the different Ambassadors and Ministers Plenipotentiary, who receive no salary from the public purse.

Vessels employed in the foreign trade of the United Kingdom.—An account of the number and tonnage of Vessels, distinguishing the countries to which they belonged, which entered inwards and cleared outwards in the year ended 5th January, 1835, compared with the preceding year; stated exclusive of vessels in ballast, and of those employed in the coasting trade between Great Britain and Ireland:—

Total of the foregoing articles	£34,489,384	£36,541,926

TRADE, STATISTICS, &c.

Statistics of France.—Territory.—France extends 537½ miles in greatest length, and in greatest breadth 512½ miles; the circuit of her extreme boundaries comprises 2500 miles, and her superficial area contains 202,500 square miles, in which numbes are included 25,453 square miles of forest land.

Forests.—The most extensive forests are situated in the eastern and southern parts; in those provinces which are also the most fertile. Of the whole forest land of France, an extent of rather more than 4210 square miles is the property of the State; about 7120 belong to corporations and public institutions; 247 to the crown; 720 to the royal princes; and 12,162 to private individuals. In the forests thirty-seven kinds of trees are found; they grow to a height of between thirty and forty feet: only seven species are applicable to ship-building and carpenters' work. The yearly produce of all the forest-land of France is valued at 4,400,000*l.*

Mineral Springs.—The whole number of mineral springs, both hot and cold, is 240, and there are few provinces which are without some of them; their temperature varies from 59° to 170° and 190° Fahr.

The *Mines* of France furnish copper, lead, iron, and pit-coal. The iron is extremely good. Its ores, in many instances, lie immediately below a thin layer of soil; this is found to be the case in the provinces of Berty, Nivernois, Guercy, Languedoc, and Champagne; in Alsace, Franche Comté, Lorraine, and the Vosges Mountains, the ores occur in lower strata; they exist also in the Alps and Pyrenees, in Vivarais and the Dauphiny, but are only extracted with considerable labour. There are at present 520 mines worked; they employ 30,000 men, and occupy a surface of 8237 square miles.

Population.—Authors have differed as to the proportion of the population to the territory, and this has been chiefly owing to the varying calculations that have been made of the extent of the surface of the land. Malte-Brun estimates the total number of square miles at 196,830; the *Dictionnaire de Géographie* at 295,800; Perrot, in his 'Statistical and Geographical Atlas,' at 196,485; and Mentelle at 202,500. M. de Chateauneuf gives the following results, grounded upon a recent survey; extent, including the island of Corsica, 208,845; exclusive of Corsica, about 207,000 square miles. The population amounted in 1831, when the census was taken, to 32,562,900 souls; including the population of Corsica, which amounted to nearly 200,000 souls. In the *Northern Region*, including eight provinces, or 25 departments, and 52,095 square miles, the proportion of persons to the square mile, in 1785, was 159, and is now 212. In the *Central Region*, including 17 provinces, or 35 departments, and 85,065 square miles, there were fifty years ago 121, but there are now 150 individuals to the square mile. In the *Southern Region*, in which there are seven provinces, or 27 departments, and 63,330 square miles, the number of inhabitants was 96, but is at present 130 to the square mile. Hence it appears that the lapse of half a century, and the occurrence of a great revolution, have but very slightly altered the ratio of inhabitants in the three regions, each of which exhibits an increase of inhabitants to the square mile to the amount of one-third as compared with 1785. According to the last census, the total number of persons of each sex was 15,936,500 males, and 16,626,400 females. Of the men, 8,864,200 are unmarried; 6,046,900 married; 722,400 widowers, and 303,000 enlisted soldiers. Of the females, 9,068,100 are unmarried, 6,054,400 married, and

1,501,900 widows. Of the whole population, about one-third dwell in towns; thus from 11 to 12 millions of persons inhabit 2,450,000 houses in towns, and 21 millions inhabit 3,982,450 houses in the country; this gives a proportion of 4½ persons living in each house in the towns, and 5¼ in the country. In 1775 the average number of births in one year was 901,226; deaths 820,600, and marriages 210,800; whence the population may be estimated at 23,500,000. This gives a proportion of one birth among 25 persons, one death among 29, and one marriage among 111 persons; as well as four children to each marriage. Taking the average of the fifteen years, from 1816 to 1831, the annual number of children born is 961,226, of whom 495,555 are boys, and 465,671 girls; the average number of deaths is 779,551, viz., of males 393,306, and females 386,245; the number of marriages is 235,709. Consequently, among 32 individuals there is one birth, and among 39½ one death; one marriage among 131 persons, and rather more than four children to each marriage. At present fewer children are born, and fewer die in France than formerly. For 17 boys, 16 girls are born; of natural children the proportion of births is 23 boys to 22 girls. In 1789 the greatest proportion of births was in Flanders, 1429 births to 1000 deaths; the least proportion in Brittany, namely, 918 births to 1000 deaths; the proportion of births is at present greatest in the province of the Lyonnois, viz., one birth to $25\frac{6}{10}$ individuals, and least in Normandy, where there is only one birth among 43 persons. The extreme proportions of deaths are found to be, in Brittany, one among 27 persons; and in Gascony, one among 29 persons. The proportion of births to deaths in the whole of France is 10 to 8, so that the population appears to be increasing yearly by $\frac{1}{125}$th part. Before the revolution, the average length of life was 28 years; it is now 32.

Agriculture.—Somewhat more than half the soil of France is under cultivation. The vineyards occupy $\frac{1}{20}$th part; the woods $\frac{1}{5}$th; the heaths $\frac{2}{13}$th; and the pasture lands $\frac{1}{10}$th part. Some soils will yield as much produce as 32 bushels an acre; good arable land yields from 16 to 20 bushels an acre; but the greater part yield from 8 to 12 only. The *maximum* produce is obtained in the department of the north; the *minimum* in the department of Dordogne. Well-informed agriculturists estimate the total amount of the yearly crops of grain at less than 45 millions of quarters, and their value at 111,000,000*l.* When the quantity used for seed, brewing, distilling, and as food for cattle, is deducted, there remains an average of not more than 480 lbs. for each person's support. If the harvest is deficient, France must import grain from abroad; since the year 1828, as much produce as amounts in value to 9,600,000*l.* has been imported, while only 1,120,000*l.* in value has been sold for exportation. The limits of the cultivation of the vine extend to the west as far as the Loire near its mouth at Paimbœuf, and eastward as far as Mezières in the department of the Ardennes. More than 250 distinct species of vines are cultivated. The vineyards cover 6,480,000 acres, and their produce is valued at 24,000,000*l.* The mean weight of fruit borne by a cider apple-tree of Normandy, amounts to more than ten bushels; and four bearing trees will supply a man with cider enough for two years' consumption. About 960,000 acres are applied to the growth of the chesnut-tree; it has been computed that each chesnut-tree affords daily support to a family that would otherwise consume 25 lbs. of bread. M. de Chateauneuf states the number of cattle to be as follows:—2,500,000 horses, including 1,227,700 mares; 4,915,000 oxen and bulls; 4,000,000 cows; 855,000 calves; 2,400,000 asses; 50,000,000 swine; 31,000,000 sheep; 800,000 merino sheep; 4,000,000 bastard sheep; and 50,000,000 poultry.

Exports and Imports.—The value of the annual exports amounts, on an average of the five years from 1827 to 1832, to 24,800,000*l.*; the same period gives an average of imports amounting in value to 24,240,000*l.* The value of the exports in the year 1787, amounted to 21,720,000*l.*; of the imports to 24,440,000*l.* The value of the imports of cattle amounts to 59,280*l.*, of the exports to 3,200*l.*; imports of corn 2,075,240*l.*, exports 217,880*l.*; imports of animal products, (*i.e.*, raw hides and hair) 4,851,480*l.*, exports 2,257,680; imports of vegetables, oranges, lemons, &c. 3,794,760*l.*, exports 1,154,840*l.*; imports of mineral products 1,629,400*l.*, exports 338,240*l.*; imports of salted meat 525,780*l.*, exports 702,840*l.*; cordage and wood for building, imports 2,592,040*l.*, exports 3,636,440*l.*; manufactured cotton, imports 215,320*l.*, exports 2,324,360*l.*; silk goods, imports 568,520*l.*, exports 4,917,120; colonial produce, imports 360,000*l.*, exports 1,026,760*l.*; unwrought gold, imports 360,000*l.*, exports 679,000*l.*; unwrought silver, imports 1,385,200, exports 293,800*l.* The exchange of the two last articles is very variable; in 1830 the exports of unwrought gold amounted to 880,000*l.*, to 320,000*l.* in 1831, and to no more than 120,000*l.* in 1832. In the year 1831 unwrought silver to the value of 160,000*l.* was exported; during the following year the exports had increased to 920,000*l.*; the imports were, for 1831, 1,720,000*l.*; for 1832 only 440,000*l.*

The *Produce* of the *Mines* amounts yearly, upon an average, to 1,768,434 cwt., or, in value, to 3,200,000*l.* To this quantity add 838,894 cwt. of mineral produce imported. This gives a total of mineral produce 2,607,325 cwt., valued at 4,560,000*l.*, and employing 1240 smelting-houses.

Commerce.—The foreign trade of France employs 60,000 men, and 8000 ships, of which only 300 are French bottoms. The trade with Asia is carried on to an amount of 800,000*l.*; with Africa to 880,000*l.*; with South America to 1,640,000*l.*; with North America to 8,600,000*l.*; with the rest of Europe to 30,540,000*l.*; and with her colonies to an amount of 4,120,000*l.* France receives from Africa and Asia 960,000*l.* value of raw materials, and returns only 280,000 value; the value of her industrial produce exported thither is 440,000*l.* The total amount of exchange of commodities of every kind with the New World is 10,400,000. France receives from Europe raw materials to the value of 12,240,000*l.*, and returns in commodities of the same class 7,120,000*l.*; she receives 2,480,000*l.* worth of manufactured goods, and returns 8,720,000*l.* worth.

A comparison of the budgets for the years 1785 and 1835, shows a total expenditure of 24,400,000*l.* for the former year, a total estimated expenditure of 40,000,000*l.* for this year. The budget for 1785 included a sum of 4,328,000*l.* for war charges; the average imposts per person being 24 livres 8 sous on a population of twenty-five millions. It is now 1*l.* 4*s.* 9½*d.* on a population of thirty-two millions of souls.—*Statistique de France par Benoiston de Chateauneuf.*

French Revenue.—The following is an official statement of the produce of the Indirect Taxes for the First Quarter of 1835, compared with that of the corresponding Quarter of 1834:—

Indirect Taxes.	Product of First Quarter.		Difference in 1835.	
	Of 1834.	Of 1835.	Increase.	Decrease.
Register, Stamp, and Mortgage Duties	48,747,000	50,401,000	1,654,000	..
Custom, Navigation, &c. Duties	22,779,000	21,578,000	1,799,000	..
Salt Duty collected on the Coast.....	10,994,000	11,882,000	888,000	..
Liquor and Liquid Duties	16,265,000	17,405,000	1,140,000	..
Salt Duty collected in the Interior.....	1,642,000	1,581,000	..	58,000
Divers Taxes (Public Conveyances, &c)	5,437,000	6,127,000	690,000	..
Product of the Sale of Tobacco and Snuff ...	17,648,000	17,852,000	204,000	..
Product of the Sale of Gunpowder.....	759,000	873,000	114,000	..
Postage and Duty of 5 per cent. on Remittances	8,058,000	8,272,000	214,000	..
Postage (Rural Service)	391,000	432,000	41,000	..
Product of Malls and Packets	401,000	391,000	..	10,000
Lottery	1,155,000	987,000	..	168,000
	134,276,000	140,784,000	6,744,000	236,000

Increase of Product in 1835.....6,508,000 fr.

Compared with the corresponding Quarter of 1834, the increase in the first Quarter of 1835 is 7,310,000 fr.

Friendly Societies Institution.—An Association for the encouragement and protection of Friendly Societies has been in existence for some time. Its objects are, to form a fund to assist members of Friendly Societies at periods of unexpected distress, for which the rules of their respective societies may not provide sufficient means of relief; to protect societies, or individual members of societies, in their legal rights; to assist with advice; to open communications with the various societies in the kingdom; to collect and diffuse information; to form a library of such books, acts of parliament, and other publications as may be deemed useful; and to assist and encourage by every means not pecuniary the formation of Friendly Societies.

A public meeting of the Association was held on the 4th of March last, to receive the report of the provisional committee, and to appoint office bearers for the ensuing year. Lord Brougham consented to become Patron of the Institution, and B. Hawes, Esq., M.P., was nominated President, and C. S. Forster, Esq., M.P., J. Tidd Pratt, Esq., and John Meadows White, Esq., were elected Vice-Presidents.

The provisional committee state, in their report, that deeming it advisable to extend information, and make known the objects of the Association, they had held, during the winter, monthly discussions, to which all persons, members or otherwise, of Friendly Societies were invited. These meetings appear to have created some interest. One question which was discussed was, "Which is the best mode for Friendly Societies to invest their funds?" which was decided by those present giving the preference to the government funds. Another question was, "Which is the best mode of settling disputes in Friendly Societies?" which was decided, in the same way, by those present declaring themselves friendly to arbitration, the arbitrators to be chosen from among members of Friendly Societies. The committee suggest the establishment of a periodical work, to be published by the Institution, as a medium of communi

cation, and a means of disseminating correct information relative to Friendly Societies.

Sanguine hopes are expressed in the report as to the advantages likely to result from the formation of this Association. The different acts of parliament for the encouragement and protection of Friendly Societies, and their incompleteness for their purpose, are adverted to, their incompleteness being attributed to the want of sufficient information on the part of the legislature; while, at the same time, the want of such an association as this has, it is said, been felt by the different societies, which, at great inconvenience and expense, sent up delegates, or adopted other modes, to bring before parliament their sentiments on these legislative enactments. Much benefit, also, is expected to result from the advice which will be afforded to individuals who, without experience, are establishing societies, and are either improperly investing their funds, or are adopting defective and ultimately ruinous regulations—from the assistance which may be afforded to those who, from causes beyond their control, may be thrown out of the benefits of a society to which they had contributed during perhaps a long period, and that at a time when age and want may incapacitate them from adhering to the regulations—from the protection which individuals or societies will receive in any case of injustice or fraud, with which singly they may be unable to contend—and, ultimately, it is anticipated that, from the dissemination of correct information, the number of Friendly Societies and their members will be increased, and that, being established on sound principles, such associations will hold out a reasonable prospect to those who join them of affording the expected benefit at the necessary time. In this manner it may be expected that a spirit of forethought and prudence will be diffused amongst the industrious classes which will prove highly beneficial to the best interests of the nation.

PARLIAMENTARY REGISTER.

LIST OF BILLS BROUGHT IN.

HOUSE OF COMMONS.

May 12. London Small Debts Bill—"for amending and consolidating the acts of Parliament for the recovery of small debts in the City of London and the liberties thereof, and for enabling the goods of the debtors to be taken in execution."

13. Sale of Bread Bill—"to repeal the several acts now in force relating to bread to be sold out of the City of London and the liberties thereof, and beyond the weekly bills of mortality, and ten miles of the Royal Exchange, and to provide other regulations for the making and sale of bread."—*Captain Pechell.*

14. General Turnpike Act—"to exempt carriages carrying manure from toll."—*Mr. Byng.*

— Foreign Enlistment Bill—"to repeal an act of the fifty-ninth year of King George the Third, for the prevention of foreign enlistment, saving and excepting so far as it repeals former statutes."—*Colonel Evans.*

May 18. Assizes Removal (Ireland) Bill—"for the appointment of convenient places for the holding of assizes in Ireland."—*Mr. O'Loghlen.*

— Annual Indemnity Bill—"to indemnify such persons in the United Kingdom as have omitted to qualify themselves for offices and employments," &c.—*Mr. F. Baring.*

20, Inns, Alehouses, and Victualling Houses Bill—"for the better regulation and management of."—*Mr. Hawes.*

22. County Coroner's Bill—"to regulate the office of and mode of electing county coroners."—*Mr. Cripps.*

— Salmon Fisheries (Scotland) Bill—"to amend an act of the ninth year of his late Majesty King George the Fourth, for the preservation of the salmon fisheries in Scotland."—*Mr. Patrick Stewart.*

May 27. Polls at Elections Bill—"to limit the time of taking the poll at contested elections of members to serve in Parliament to one day."—*Mr. Elphinstone.*

— Parish Vestries Act Amendment Bill—"to amend an act of the fifty-eighth year of King George the Third for regulating parish vestries, in so far as to afford to Westminster, and certain parishes within the Bills of Mortality in the counties of Middlesex and Surrey, an exemption which is extended in the said act to London and Southwark."—*Colonel Evans.*

— Capital Punishments Bill—"for abolishing capital punishments in cases of letter-stealing and sacrilege."—*Mr. Ewart.*

— Prisoner's Counsel Bill—"for enabling prisoners to make their defence by counsel or attorney."—*Mr. Ewart.*

LIST OF COMMITTEES.

HOUSE OF COMMONS.

May 13. Select Committee, "to whom shall be referred the petitions of certain maritime officers of the East India Company's Service, and who are to examine into the circumstances under which some officers have been excluded from compensation."

— Committee "to inquire into the present state of the harbours of Leith and Newhaven, and the best situation for constructing a harbour in the vicinity of Edinburgh."

14. Committee "to inquire into the case of Mr. Goldsworthy Gurney."

19. Committee "to inquire into the present state of the trade in corn between the Channel Islands and the United Kingdom."

25. Committee "to inquire into the present system of management in the Court of Bankruptcy, and to report thereon."

POLITICAL RETROSPECT FOR MAY, 1835.

GREAT BRITAIN.

THE numerous elections occasioned by the late changes have principally occupied public attention during the past month. With very few exceptions, the members or friends of the Government have been everywhere returned. No opposition was offered to the returns of Sir John Cam Hobhouse for Nottingham, Mr. Spring Rice for Cambridge, Sir George Grey for Devonport, Sir Thomas Troubridge for Sandwich, Mr. W. H. Ord for Newport, Lord Seymour for Totness, Sir Rufane Donkin for Berwick, Lord Howick for Northumberland, Admiral Adam for Clackmananshire, Lord Dalmeny for the Stirling burghs, Sir Henry Parnell for Dundee, Sir John Campbell for Edinburgh, Colonel Leith Hay for the Elgin burghs, Mr. R. C. Fergusson for Kirkcudbrightshire, Mr. R. Stuart for the Haddington burghs, Mr. Perrin for Cashel, Lord John Russell for Stroud, and Sir Charles Pepys for Malton. The Tory candidates have been defeated at Taunton by Mr. Labouchere, at Manchester by Mr. Poulett Thomson, at Penryn by Mr. Rolfe, at Poole by Captain Byng, in the West Riding of Yorkshire by Lord Morpeth, at Leith by Mr. Murray, and at Dungarvan by Mr. O'Loghlin. Mr. O'Dwyer, who had been unseated by the decision of a select committee, has also been again returned for Drogheda by a large majority over his Tory opponent. On the other hand, North Essex has again returned a Tory representative, and the contests in South Devon and in Invernesshire, which were both formerly represented by Whigs, have terminated in the returns of members opposed to the present administration. The ministerial candidate has also been defeated in South Staffordshire.

The Houses of Lords and Commons reassembled, pursuant to adjournment, for the transaction of public business, on Tuesday the 12th of May, the House of Lords however having, as had been arranged, sat since the 30th of April for the hearing of appeals.

In the House of Lords, on the 12th, the Duke of Richmond presented a report from the Committee on Prison Discipline, which was ordered to be printed. It was afterwards stated by Lord Lansdowne, in answer to a question of Lord Brougham, that the subject of the charter of the London University was under the consideration of the Government, and that no time would be lost by his Majesty's advisers in devising the means of complying with the late expression of opinion in regard to that matter on the part of the House of Commons.

The same evening, in the Commons, Sir George Grey stated that Lord Aylmer, the present governor of Canada, was to be recalled, and that, instead of a single commissioner, a commission consisting of two or three persons would be immediately sent out to investigate the state of affairs in that colony. Lord Amherst, he added, to whom the appointment had been offered, had declined to preside over this commission. Mr. Buxton afterwards moved that an address should be presented to the crown, requesting his Majesty's interference with foreign powers to induce them to take effective measures for the suppression of the slave trade, which the honourable member showed is still carried on to a great extent. The motion was supported by Mr. Spring Rice, but was eventually withdrawn in order that the proposed address might be reduced to a shorter and simpler form. Thus amended, it has since been agreed to.

On the 13th various bills were brought in or advanced a stage, and some committees were appointed; but no discussion of any importance took place.

On Thursday the 14th Lord Mandeville introduced a motion for papers connected with the outrages at the Armagh races in October last, by a long speech, in which he brought forward strong charges of unfairness against the Earl of Gosford, in the execution of his office of Lord Lieutenant of the county of Armagh. He was answered by Dr. Lushington, who proved that the charges were utterly groundless; and after the original motion had been negatived without a division, another, proposed by Mr. Hume, was carried, to the effect that the conduct of Lord Gosford afforded not the slightest ground of complaint, and that the imputations made against him were entirely without foundation.

On Friday the 15th, a discussion on Irish politics arose in the House of Lords, in consequence of certain comments of the Earl of Wicklow on the manner in which the new viceroy, Lord Mulgrave, had made his public entry into Dublin, accompanied, as it was asserted, by a crowd bearing illegal banners. Lord Melbourne declared that the information he had received led him to believe that the statements about the banners were without foundation. This subject was again brought forward on subsequent days, first by Lord Londonderry and afterwards by Lord Roden, when the same explanation was repeated by ministers. This evening a petition from the Common Council of the City of London, praying for the abolition of the taxes on knowledge, was presented by Lord Brougham, who in his speech stated his objections not only to the newspaper stamp duty, but also to the duties on paper and on imported books.

In the Commons, after a short discussion on Canadian affairs, occasioned by a complaint of Mr. Roebuck against the conduct of Government in regard to certain payments which it had, as he asserted, improperly authorized Lord Aylmer to make out of the military chest, the House went into a committee of supply, and proceeded with the miscellaneous estimates. The Imprisonment for Debt Bill was afterwards referred to a select committee.

On Monday the 18th, in the House of Commons, on the question that a new writ should be issued for the borough of Stafford, in consequence of the vacancy created by Sir F. H. Goodricke having accepted the Chiltern Hundreds, an amendment, moved by Mr. Divett, "that the issue of the writ be suspended till further notice," was carried without a division. The House afterwards went into a Committee of Supply, when the Ordnance Estimates were brought forward by Colonel Leith Hay, and various grants of money voted.

On the 19th Mr. Wyse explained his views on the subject of national education in Ireland, and obtained leave to bring in a bill for carrying them into effect. Mr. Divett then moved that the House should resolve itself into a committee of the whole House, to consider the act passed last session for increasing the duties on spirit licences, which the honourable member wished to have repealed; but on receiving an assurance from the Chancellor of the Exchequer that the subject was under the consideration of the Treasury, and that a scheme was now before the Board which it was expected would do away with the grievances complained of, without any abandonment of revenue, he withdrew his motion. After this Mr. Ward explained the plan for taking the divisions of the House, which had been agreed upon by the Select Committee appointed to take that matter into consideration, and which consisted in having two lobbies, one for the Ayes and another for the Noes. On the suggestion of Mr. Rice, the report of the committee was referred to the committee appointed to consider the rebuilding of the Houses of Parliament.

On Wednesday the 20th a debate of some length took

place on the motion that the House should resolve itself into a committee on Mr. Poulter's Sabbath Day Bill. Mr. Hawes moved that the bill should be referred to a select committee; but the honourable member eventually withdrew this amendment, and the original motion was agreed to. The bill afterwards went through the committee, was reported, and was ordered to be printed. The House then resolved itself into a Committee of Ways and Means, when grants to the amount of eight millions, from the Consolidated Fund, were voted for the service of the ensuing year.

On Thursday the 21st, in the House of Lords, Lord Brougham detailed, at considerable length, his plan for the promotion of national education, and concluded by moving fourteen resolutions embodying its leading principles. His lordship expressed himself opposed to the Government undertaking the establishment of a general system of schools, on the ground that such an interference would in all probability check or put a stop to the exertions of private individuals, by means of which he contended that the want of common schools was already in the course of being supplied nearly as fast as was desirable. He admitted, however, the inferior quality of the education dispensed at such schools, and to remedy that evil proposed that normal schools, or schools for the education of teachers should be instituted, and supported from the public funds. Lord Melbourne undertook, on the part of the Government, that the subject should immediately receive the closest and most anxious consideration.

On Friday the 22nd an animated discussion arose in the Commons on the motion for the second reading of a bill for the establishment of a police in Liverpool, and the payment of the clergyman of that borough from the corporate funds. The motion was warmly opposed by Mr. Ewart, Mr. O'Connell, Mr. Sheil, and other honourable members, but was carried on a division by a majority of 185 to 171. After this Lord John Russell, amid loud cheers, gave notice that on Monday the 1st of June, he would move for leave to bring in a bill for the better regulation of the municipal corporations in England and Wales. The Dissenters' Marriage Bill was then read a second time, *pro forma*, on the motion of Sir Robert Peel; but it was intimated that the measure, in all probability, would not be proceeded with, ministers expecting to be able, in another session, to prepare a more comprehensive and satisfactory measure, in connection with a plan for a general registration.

FRANCE.

The occurrences during the past month among our neighbours have not been of a very interesting character. The subject which has most engaged, and still engages public attention, is the trial of the political prisoners, now nicknamed *Le Procés Monstre*, or the monstrous prosecution. Newspaper writers may declaim, and denounce, and give names as they choose, but the great majority of the nation, the respectable and sober-minded mass, that has nothing to gain from party oratory or wit, and that is only anxious for the maintenance of peace and good order, evidently thinks with the king that the trial ought to be carried on and sentence pronounced, after which it will be time enough to talk of an amnesty. The royal faculty of mercy or pardon naturally follows conviction, but cannot, with any regard to law or the purposes of justice, precede it.

A meeting of the peers, to settle the preliminaries of the trial, was held at the beginning of May. Thirty-seven peers, among whom were Gerard, Soult, Talleyrand, Pontecoulant, Grenier, and Deux-Brèze, tendered their excuses for non-attendance, but the larger number of these excuses were deemed invalid and the persons offering them urged to attend the trial. It was decided that *even the ministers of the crown*, if they were peers, should in that capacity act as judges. It was further resolved that with the exception of the fathers and brothers of the accused, none but barristers should defend the prisoners, and that the barristers named by the president of the court should be compelled to attend for the defence; in case, however, the prisoners should refuse the assistance of these barristers so named, it was intimated that their attendance would be dispensed with. It was calculated that about 140 peers would open the trial, but (a curious omission) it was not settled what number would make a quorum. Tuesdays, Wednesdays, Fridays, and Saturdays, from twelve o'clock to five, were appointed for the trial, which, according to some calculations, will thus occupy some six months.

The new hall, built of wood, expressly for the trial (the Chamber of Peers being much too small), and erected in fifty days, at a cost of 360,000 francs, is described as being an elegant, six-sided building.

At the appointed hour on Tuesday, the 5th of May, the prisoners were brought to the hall under an escort of National Guards, the employment of royal troops, or the line, being carefully avoided.

The Republicans of Lyons (for whose exploits and insanity we beg to refer our readers to the 'Companion' for May, 1834) were the first to enter the court, and a very strange group, or rather troop, they presented. Many wore cocked hats, all moustachios, and not a few had long beards besides; but a figure that attracted most attention was a man, *à la Robespierre*, who was so dressed, shaved, and combed, as to look the very image of that mild and merciful Republico-Jacobin. The next that arrived were the Paris Republicans, who wore red ribbons and tri-coloured cockades in their leather or cloth caps; and these were soon followed by some non-commissioned officers of a regiment of cavalry, who had been engaged in a conspiracy at Luneville. The total number amounted to about 140, including men of all callings, from newspaper editors with their *subs*, down to weavers and weavers' helps.

On calling over their names, eighty-two of the peers were found to be absent. When Baron Pasquier, as president, interrogated the accused as to their names, ages, professions, &c., the Lyonnese replied readily enough, but when the same questions were put to the Parisian and other prisoners, they refused to give any answer until barristers of their own selection were admitted into court to plead for them. One of the prisoners then rose and demanded that their wives and other female relations should be admitted into court, on which a scene of great confusion ensued. A certain Cavaignac made a stormy speech, insisting that counsel not belonging to the bar, but chosen by the prisoners, should be allowed to plead for them. The court passed a negative on all these demands, and the first sitting concluded without much progress being made. The over arbitrary mode of proceeding adopted by the peers has dissatisfied many persons who were convinced of the necessity there was for the trial.

In the act of accusation the prisoners are distributed into three classes, the first containing the names of those only who were actually engaged in open defiance of authority, in the streets of Paris, Lyons, &c.; the second, of those who, by writing or speaking, excited to insurrection, or assisted at previous deliberations for arranging its outbreak; and, the third, those others who, by procuring arms, supplying money, advice, &c., aided in furthering the ultimate object. A heavy charge against all the prisoners is that of being members of, or belonging to the *Society of the Rights of Man*, or *Club of the Cordeliers*, both which associations are denounced as treasonable, and formed solely for the purpose of overturning the government. The origin and progress, or rather revival of these societies, are traced with great minuteness in the act of accusation. They are stated to have existed since June, 1832, and to have been incessantly and actively engaged in organizing the means of rebellion ever since. The outbreaks of Lyons, Grenoble, Marseilles, and of June, 1833, and April, 1834, of Paris, are charged as part of the working of the same plot. The overt acts of treason to be proved against the prisoners, and which are said to be susceptible of distinct proof, are, the organisation of an association with a central committee and corresponding sections, in itself unlawful; the passing of a resolution by that committee for the overturning of the government; the names of Marat, Robespierre, Jacobins, &c., given to the sections; the cries of "Death to tyrants," uttered and inscribed upon flags on occasion of the several disturbances, and other acts tending to show a unity of action in the various sites of these disorders. The act concludes by inculpating by name 110 as guilty of direct and open rebellion, 19 public writers, &c., of having fomented, and 83 of having indirectly promoted and favoured the plan of resistance to the government.

It would occupy much more space than we have to spare, and would be neither instructive nor amusing to follow up all the details of this interminable state trial, which we must dismiss for the present in very few words.

At the third sitting of the court, when the prisoners were

turbulent and determined not to answer, and interrupted the proceedings at every step, the peers decided that all such as were refractory should be carried back to prison, and their trial proceeded with in their absence. They were, however, to be produced to cross-examine the witnesses against them if they felt disposed so to do. During the latter part of the reading of the Act of Accusation, which took up three days, only twenty-seven prisoners were in court, all the rest refusing to submit or acknowledge the authority of the high tribunal. At a subsequent sitting twenty-two of the twenty-seven who had consented to hear the accusation read, protested against the general course of the proceedings. It will be curious to see how all this will end, for Louis Philippe and his government seem resolved to cede no point, and not to swerve a line's breadth from the path they have marked out. Eighty thousand regular troops, stationed in or about Paris, are ready to maintain their authority, and, in spite of rumours to the contrary, the National Guards appear to be steady and well disposed.

The government has somewhat unnecessarily embarrassed itself with a fresh prosecution of the press, and made a great stir about a matter which must be of small consequence, viz., the insertion in the concluding number of the 'Tribune' (a condemned and destroyed newspaper) of the protest of the prisoners, and of a letter addressed to them, bearing the signatures of ninety-one persons.

Some trifling subscriptions have been got up among the Republicans of the capital for the benefit of the accused, who are now all lodged in the Luxembourg, but separated into classes, those of Paris not being allowed to communicate with those from Lyons, &c. Various slight attempts to get up riots, particularly in the neighbourhood of Porte Saint Martin, have been made from day to day, but have, as yet, ended without any serious mischief.

During their spare time from the trial, the peers have been engaged upon the American indemnity, which question is not likely to be thoroughly settled for some months to come.

In Lyons, where trade has begun to revive from the miserable, revolutionary shock of last year, the apprehensions of the friends of peace and order are quieted by the presence of a very strong garrison, and by the new forts, which would effectually check the suburbs and the riotous parts of the city.

At the end of April the Chamber of Deputies came to a division on the Anti-Slavery question, when emancipation was refused by a majority of 240 to 51!

This decision is not very honourable to the practical philanthropy of France. Deputies seem to have been willing enough to emancipate at the expense of the slave-holders, and to enjoy the honours of a vicarious generosity; but when it was suggested that a compensation, after the practice of England, must be made to the planters out of the French purse, they clapped their hands on their pockets and refused to hear another word about it. If the negroes could not be raised to the dignity and rights of free-men, without so many millions of francs, in sooth, they were to remain slaves until the day of judgment for all that the philanthropic *Chambre des Deputés* would do to help them! This conclusion, of course, was not put quite so frankly. Other arguments against emancipation were used, the strangest of which was, that the French slaves were not so well prepared for it as the English slaves!

We mentioned in our last retrospect that M. Thiers had demanded an additional grant of 1,265,000 francs, for secret service money, declaring that if the grant were refused him he would resign. The deputies have voted the full amount by a majority of 259 to 129.

The Inland Navigation Bill, in spite of the strenuous opposition of the Minister of the Interior, has been referred back to the committee (which is equivalent to an adjournment of the question to the next session) by a majority of 169 to 150.

Marshal Maison, who was absent on a foreign mission when the present cabinet was formed, has accepted the office set down for him—*i. e.* that of Foreign Affairs. It was most confidently asserted, that he would refuse it or any other place in the existing ministry.

SPAIN.

Within the last month the constitutional cause in this unhappy country has decidedly retrograded, and while blood has been spilt there, and men's minds agitated by the hopes or the fears of the speedy triumph of Don Carlos, our speculators on the Stock Exchange have been making or losing fortunes in the rapid variation of Spanish bonds.

Valdez, the minister of war, and commander-in-chief in the north, has not been more successful than Mina, whom he succeeded, as the opposer of Zumalacarregay. The progress the Carlists seem to have made is not, however, attributable so much to victories gained in the field, as to other moral causes, encouraging to them and discouraging to their enemies. Foremost among these we must place the mission to the seat of war of Lord Eliot and Colonel Gurwood. Nothing could be more praiseworthy than the ostensible object of this mission as set forth by the late Conservative government—*i. e.* that it was to endeavour to put a stop to the cruelties practised by both belligerents, and render the war between the Carlists and Constitutionalists less bloody and atrocious. To carry this single object into effect, we should have expected that his Lordship and his adjoint would have shown themselves equally friendly to both parties, and not have reserved all their countenance (or at least the semblance of it) for one. It appears, however, from all we can learn, that from their first arrival, when they were received with demonstrations of joy and triumph by Zumalacarreguy's forces, to the moment of their departure, they acted in such a manner as to make both Carlists and Christinos believe that matters were changed in England with the late four-months' change of ministers, and that we should hail with delight the triumph of Don Carlos. Except a brief and dry correspondence, and (we believe) one interview with the opposite party, they seem to have had no intercourse with the Constitutionalists; but they quite domesticated themselves with the pretender, moving where he moved, and giving him (as the Christinos firmly believed) the benefit of their advice and encouragement. The poor Spaniards attach an awful importance to the title of a Lord, and it was pretty generally known that Colonel Gurwood was a bosom friend of the Duke of Wellington, who, and not Sir Robert Peel, was supposed to hold the will and destinies of England in his hands.

As soon as the news of the arrival of Lord Eliot in Don Carlos's camp reached London, it was generally rumoured that the whole of the remaining family of the pretender, residing in England, were packing up, and it was *presumed*, by an important organ of the Tory party, "that the interview between Don Carlos and Lord Eliot had been the cause of this sudden movement."

A series of battles or skirmishes took place from the 20th to the 24th of April, between the forces of Valdez and Zumalacarreguy, *during which Lord Eliot and his suite were with Don Carlos, at Segura, close to the scenes of action!* Though these games of blood produced no great results, they seem to have been rather unfavourable to the young queen's troops, who, however, succeeded in penetrating into the Amescoas, which wild district had hitherto been the unmolested retreat of the Carlist bands. Immediately after the intelligence reached us that Don Carlos had readily consented to carry on the war in a more merciful manner, we heard of his chief, Zumalacarreguy, massacring in cold blood about thirty young recruits for the Constitutional army, who had fallen into his hands. In addition to the losses of Valdez, Iriarte, another of the queen's generals, sustained a severe check in the neighbourhood of Guernica, on the 1st of May. A report that Bilboa was taken by the Carlists proved, however, to be wholly incorrect, as well as the rumour that their cause was about to be strengthened by Don Miguel, who had landed in Portugal, and begun to re-revolutionize that country.

It is certain that great uneasiness has been felt in Madrid, proceeding as much from the turbulent spirit of the insane ultra-liberal party as from the occurrences in the north. In the Chamber of Procuradores, it has been resolved that some conventual property, and half of the common and crown lands, should be appropriated to the payment of part of the public debt. On the same day the ministers were defeated in a motion that two-thirds of the *Vales non consolidados* should be consolidated with bonds at four per cent., and the remainder be exchanged for securities in the five per cents. paper interest. The committee proposed that

only one half of the Vales should be consolidated, which was carried by a majority of 78 to 41. This vote is said to have much disconcerted both the ministers and speculators in the Madrid Exchange.

During the course of a debate on the 6th of May, a member asked whether it were true that intentions existed of altering the law which excluded Don Carlos and his heirs from the throne, and was answered in the negative by Martinez de la Rosa. To another question respecting the necessity of foreign aid or the armed intervention of England, France, and Portugal, (parties in the quadruple alliance) Count Toreno replied that such a measure had never been seriously proposed in the Cabinet, and that the Queen and Constitution were in a condition to do without any such assistance.

On the 10th of May the Procuradores moved for an examination into the conduct of ministers respecting the stipulations agreed to, at the suggestion of Lord Eliot, by General Valdez and Zumalacarreguy, demanding, at the same time, a full communication of the said stipulations, which, according to common report, merely relate to the fair exchange of prisoners of war between the two parties, the cessation of massacres, &c. but which were believed by a party in Madrid to include a clause that Don Carlos's son should be affianced to the young queen, his cousin, and elevated to the Spanish throne. The inquiry was warmly opposed by Martinez de la Rosa, but was carried against him by a majority of fifty-four to fifty. On leaving the house that minister was followed by a riotous mob, said to have been wholly composed of exaltados or ultra-liberals, who uttered the fiercest cries, calling him Carlist and traitor, and vowing vengeance upon him. At one moment his life was supposed to be in danger, but he finally reached his home uninjured. This is another of the advantages derived by the constitutional party from the mission of Lord Eliot and Colonel Gurwood. On the 12th of May Count de Toreno made a powerful appeal for his colleagues, and demanded that the instigators and the actors in the riot should be brought to a severe account. On the same day thirty members of the chamber of Proceres, or Peers, moved an address to the queen-regent, requesting her to adopt energetic measures against the disturbers of the public peace. On the 14th, the sittings of the procuradores, at which Martinez de la Rosa was present, passed off very tranquilly, and no further riots were apprehended at Madrid for the present.

As if Colonel Gurwood were destined to be the *bête-noire* of the constitutionalists, he had no sooner reached London than a letter bearing his name, and purporting to be an account of what passed in an audience at Paris with Louis-Philippe appeared in most of our public journals. According to this letter the French monarch spoke most favourably of Don Carlos, calling him a good, honest man, and the like; and the inference people generally, and perhaps too rapidly, drew from this account was, that Louis-Philippe's heart was entirely disposed to Don Carlos, and that therefore the French would not assist the young queen, or perform what they engaged to do in the quadruple treaty.

By what novel rule in diplomacy Colonel Gurwood was justified in making such a disclosure, at such a time and in such a manner, we are wholly at a loss to determine. Neither do we know the extent of the evil effect his revelation will produce on the queen's cause; but this we *do know* that such a bomb has not been thrown into the Stock Exchange for many a day, and that the name of Gurwood will long live in the recollection both of the bulls and bears that therein congregate.

With regard to the speculation now afloat as to the reconcilement of differences by a marriage, we think it wholly nugatory. We endeavoured to show twenty months since (see 'Companion' for November 1st, 1833) that the civil war in Spain was not a war for this or that person—for Don Carlos or Donna Isabella, but a conflict of political principles which was to determine whether absolutism or constitutionalism should be the future rule of the country. We said on that occasion, which was before the beginning of a regular war,

"The new contest, to which the succession to the Spanish throne is probably about to give rise, promises to be mainly influenced and propelled by passions very little connected with any feelings of attachment to the individual claimants under whose name the contending parties may array themselves. The conflicting pretensions of Isabella and of Carlos will merely serve to muster and separate the combatants. If the quarrel involved nothing more than the claims of the uncle and the niece, there would be a chance of its being decided without the arbitration of the sword. An arrangement might be come to, which, by allowing Carlos to mount the throne now, and affiancing the young princess to his eldest son, her cousin, would satisfy and unite both parties. But the two real competitors are looked upon by their partizans as being divided from and opposed to each other by something much more difficult to get over than a mere difference of personal interests. * * * This must be from the first a contest of principles—a strife not to be settled by cessions of territory or any other arrangements partaking of the nature of a compromise, but only by the entire subjugation, for the time at least, of one or other of the two irreconcilably hostile forces between which it was carried on. * * * There is nothing at all about which to fight, if the partizans of absolutism are not to be on the one side, and those of constitutionalism on the other."

These positive facts and considerations alone have kept our attention anxiously awake to affairs in Spain. Without them we should have been inclined, at least as far as our own feelings are concerned, to have closed the subject long ago with something like the following brief remarks made by Chesterfield during the seven years' war. "The late actions have only thinned the human species, without giving either party a victory, which is plain by each party's claiming it. Upon my word, our species will pay very dearly for the quarrels and ambition of a few, and those by no means the most valuable part of it. *If the many were wiser than they are, the few must be quieter, and would, perhaps, be juster and better than they are.*"

PORTUGAL.

Some objection seems to have been taken to the marriage of the Queen Donna Maria with her recently deceased husband's brother, Prince Maximilian of Leuchtenberg. A party which, however, is evidently in the minority, proposes to substitute the Duke of Nemours, the second son of the French king. This subject, which is not very interesting in the abstract, and which presents some disgusting points, has mainly engrossed the attention of the Portuguese.

Since the disgraceful riot and attack upon Palmella which we recorded last month, that minister seems to have withdrawn from public business, though he still directs the counsels of the queen.

The Count Villa Real, who is also minister of war, has taken Palmella's place as secretary of state, and Count Linhares has succeeded him as president of the council. A few other changes have taken place in the cabinet.

The law for the sale of national and church property, after being somewhat amended, has passed, and the *public auctions* are to commence about the end of June. According to the most moderate calculation, the united property to be thus brought to the hammer is worth from twelve to fourteen millions sterling; but it will be a long time before either of these sums, or anything like it, will reach the Portuguese exchequer, as, in order to facilitate the disposal of the lots, in a country where capital is scarce, government has agreed to accept of payments by instalments.

We do not hear that any measures have been taken by government to preserve and keep together the monastic archives and libraries, some of which are supposed to contain curious and valuable documents and manuscripts, chiefly in relation to the history of the early maritime discoveries of the Portuguese. A man with money and the necessary talent and information might employ his time worse than in making a short trip to Portugal to attend these sales. We are quite confident many interesting things, particularly up the country, will be scattered and destroyed through the sheer ignorance of auctioneers and bidders.

The provinces seem to be totally tranquil, and no more disturbances of any consequence have occurred in Lisbon. The finances of government are described as being in rather a prosperous condition, but there is a talk of drawing heavily upon them in order to send an army to the assistance of the Queen of Spain.

BELGIUM.

The fine iron rail-road from Brussels to Malines, was opened on the 5th of May, with much pomp and rejoicing, King Leopold and his court attending on the occasion. Other works of the same beneficial kind are spoken of.

On the 14th of May, some few weeks before the expected time, the king prorogued the Session of the Chamber of Deputies. The Belgian opposition newspapers, which are certainly well acquainted with the declamatory and abusive part of their business, have poured out many violent *leaders* upon this measure, attributing it to the unwillingness of the king to have discussed in the Chambers the increase of ten per cent on the taxes, which increase was voted to ministers on learning the accession of Sir Robert Peel to office, and the possibility of a change in our foreign policy. The journalists say, that now, a Whig Ministry being re-established in England, the danger is past; and that consequently the ten per cent., which was only voted to provide for that danger, ought instantly to cease.

AUSTRIA.

THE expected Act of Grace of the new emperor has at last made its appearance, and has disappointed all friends of humanity. Instead of liberating the Italian and other state prisoners who have been so long shut up in the dungeons of Spielberg Olmutz, and other fortresses, it merely provides for the milder treatment of *two* of the many captives.

CHRONICLE OF OCCURRENCES.

May 4. A duel took place between Lord Alvanley and Morgan O'Connell, Esq M P, one of the sons of Mr Daniel O'Connell, in which several shots were fired without injury to either party The duel arose out of the following circumstances —Lord Alvanley having, in his place in the House of Lords, put certain questions to Lord Melbourne respecting the supposed adherence of Mr O'Connell, and those who usually act with him, to the new ministry, and the terms on which it had been obtained, Mr O Connell took an opportunity of retorting in the House of Commons in language which gave rise to a demand for satisfaction on the part of Lord Alvanley At the same time, a requisition was presented by Lord Alvanley and other members to the managers of Brookes's Club, that they should call a general meeting of the club to consider the conduct of Mr O'Connell, but this the managers declined to do Mr Morgan O'Connell then took up the quarrel on behalf of his father, which led to the hostile meeting.

8. A deputation, headed by Dr. Birkbeck, waited upon the Chancellor of the Exchequer in Downing Street, in order to lay before him statements relative to the repeal of the stamp duty on newspapers A long conversation ensued, chiefly upon the financial difficulties connected with the removal of the stamp duty The conference lasted two hours.

10 This day was interred, in the burial ground of St. James's, Clerkenwell, Mr David Hilton He was descended from the Hiltons, of Hilton Castle, in the county of Durham a family once possessed of great wealth and of high distinction, but which ultimately fell into decay The late Mr Hilton was a newsvender and was particularly instrumental in procuring the abolition of the monopoly of the post-office clerks in regard to the sale of newspapers. This monopoly was an extreme hardship upon the independent tradesman, and it was principally through the active exertion and the judicious conduct of Mr. Hilton, that an end was put to it. The respectable body of newsvenders in the metropolis, at, we believe, his suggestion, formed themselves into a society for their mutual protection against the schemes and manœuvres of Dicas, and others, of which society Mr Hilton was the honorary secretary, the duties of which he discharged with exemplary assiduity and fidelity, under circumstances that imposed upon him no ordinary responsibility

11 Lord Mulgrave, as the new Lord-Lieutenant of Ireland, landed at Kingston, and was escorted into Dublin by a vast assemblage of the people, who went out to meet him in procession, with banners, &c.

— A dinner was given to Sir Robert Peel at the Merchant Tailors' Hall, at which the Duke of Wellington and other distinguished individuals were present. Sir Robert Peel spoke at considerable length, and urged upon those around him the necessity of exertion and activity, in order to obtain a real and effective influence in the House of Commons, as the only check to those evils which he apprehends from the present state of things

— A dinner took place on Monday at the Thatched House Tavern, to commemorate the opening of the North London Hospital, in connection with the London University Lord Brougham presided, supported by the Duke of Somerset, the Bishop of Chichester, &c. A collection was made, which amounted to 1250*l*

Public Meetings.—On the 4th, the annual meeting of the Church Missionary Society was held at Exeter Hall, at which the Earl of Chichester presided.

On the 5th, the annual meeting of the British and Foreign Bible Society was held in the same place, Lord Bexley in the chair It appeared from the report that the receipts of this society for the past year exceed those of any preceding year, the total amount collected being 107,926*l*, and that, after paying all expenses, and increasing the number of their establishments, the Society had a balance of 23,675*l*. The number of individuals who attended to hear the proceedings was so great, that upwards of six hundred were accommodated in another room, to whom a report of what was passing was conveyed.

On Monday the 11th, the anniversary meeting of the British and Foreign School Society was held at Exeter Hall. The chair was to have been taken by Lord John Russell, but in his unavoidable absence it was filled by Lord Brougham The meeting was attended by Messrs. Ainsworth, Pease, Lushington, Hume, and other members of parliament and various gentlemen and clergymen, and resolutions were passed connected with the subject which had brought them together

On the same day, the British Reformation Society held its annual meeting, Lord Mountsandford in the chair, and on the previous Saturday, the twenty-ninth anniversary of the London Hibernian Society was celebrated the Marquis of Cholmondeley in the chair. The latter nobleman also presided, on the 12th, at the annual meeting of the Naval and Military Bible Society, which was held at the Freemasons' Tavern The meeting was attended by Lords Dartmouth, Harrowby, Winchelsea, Farnham, Henley, Admiral Lord de Saumerez, and many distinguished naval and military officers

Next day, the Irish Society of London held its annual meeting, at which the Bishop of Lichfield and Coventry presided On the 14th, the annual meeting of the London Missionary Society was held at Exeter Hall. On this occasion, a daring and dexterous theft was committed Amongst the sums collected, were a quantity of bank notes and slips of paper technically termed I O U.'s, amounting to nearly 600*l*,, which were put apart in a bag, and placed on a table behind the chairman While the assembly were singing a doxology, the bag was stolen

On the 15th was held a meeting of the Anti-Slavery Society, at which Lord Brougham presided, and which was attended, amongst others, by Mr O Connell who addressed the meeting The object of the meeting was to pass resolutions in favour of the working of the emancipation scheme, and declaratory of abhorrence of slavery in whatever country it still prevailed

On the 16th, the twenty-first anniversary of the Protestant Society for the protection of religious liberty was held at the City of London Tavern Lord Brougham in the chair One of the principal speakers was Mr. O'Connell, who moved one of the resolutions.

The Right Hon Charles Grant, formerly M P for Inverness-shire, the Right Hon Edward Littleton, M P for Staffordshire, and Sir John Byng, M P. for Poole, have been respectively raised to the peerage by the titles of Baron Glenelg of Glenelg in the county of Inverness, Baron Hatherton of Hatherton in the county of Stafford, and Baron Strafford of Harmondsworth in the county of Middlesex

The Court of King's Bench in Ireland has, upon some technical objections, quashed the coroner's inquisition respecting the individuals who were killed in the tithe affair of Rathcormac.

May 16 The accomplished and amiable poetess, Mrs. Hemans, died in Dublin, after a tedious illness.

— A dinner was given by the merchants of London trading to the Levant to the Turkish Embassy at the Court of London. It took place at Richmond. Namik Pasha, the late ambassador, was prevented from attending by indisposition, but Nouri Effendi, the present ambassador, and the various individuals of the legation, were present.

18 An individual of the name of Carroll, a corporal of the marines, was executed at Maidstone for the murder of a woman, whom, in a fit of drunken fury, he had stabbed with his bayonet. The jury on the trial expressed themselves in strong terms on the inexpediency of allowing soldiers not on duty to wear their side arms

THE CORPORATION REFORM BILL.

The Bill for the Reform of the Corporations of England and Wales has at length followed the Acts for the Reform of the Parliamentary Representation, of the Scotch Burghs, of the Irish Church, of the Poor Laws, and for the Abolition of West India Slavery, not to mention various measures of inferior magnitude, which within the last three years have placed upon a new, and it is to be hoped both an improved and a secure foundation, many of the greatest interests of the kingdom. In a few months or weeks more we shall probably have the reform of the corporations of Ireland to add to the list.

The reform of the English municipal corporations was demanded—had there been no other reason—by the abuses of the existing system. The principles and the effects of that system were alike as bad as possible. The management of large funds and interests, most important to the whole community, was placed everywhere in the hands of a small number of individuals, in whose appointment their fellow-citizens had no share, and over whose conduct they had no controul. Had the circumstance of being members of a corporation converted men by a miracle into angels, such a state of things would have been still pregnant with evil. People never would have seen with satisfaction a little self-elected knot of their number in exclusive possession of the rights and powers which should have been shared by all. General discontent and suspicion, divisions and bitter party spirit, would be inevitably generated by such an arrangement, under any circumstances. In the actual case in this country it has produced plentifully all these, and also other mischiefs. Not only has the conduct of corporations been clamoured against; it has well-deserved, in a very great many instances, the public distrust and disapprobation of which it has been the object. Not only has there been a prevalent feeling that the interests of the community have been neglected, and their property squandered or misappropriated; there has been much real ground for these imputations. Power exercised without responsibility has been fertile here as elsewhere in its natural consequences. The voluminous reports of the corporation commissioners furnish abundant evidence of the disastrous operation of the existing system, in accounts of numerous boroughs reduced to poverty or loaded with debts, of the waste of public means in private jobbing and corruption, of communities torn by faction or generally arrayed in opposition to their municipal authorities, and of the consequent utter inefficiency of the apparatus of controul over which these authorities preside, either for the proper preservation of order, or the right administration of justice, or the promotion of any of those objects of public utility and convenience which come within the province of municipal government.

But the establishment of a good system of municipal corporations is in the highest degree desirable, not only on account of the evils of the present system of which it would get rid, but for its own sake. Even in a new country, or one for the first time laying the foundations of its government, it would be a work that ought to be set about as of the first consequence to the right order of the commonwealth.

Such institutions form the proper alleviation and corrective of that principle of centralization which is indispensable as the cementing and uniting element of every system of national government. Without a single supreme controlling power, there could obviously be no national government whatever; and in all countries, accordingly, affecting to occupy the position of independent states, such a power has either been formally established, or has quickly grown up under the pressure of circumstances. The first civil dissension, indeed, or the first attack from abroad, would give demonstration of its necessity, or would at once dissolve the so called state into fragments. But for the sound health of the body politic, it is necessary that there should be life in the limbs and extremities as well as in the heart. The natural tendency of a supreme central power, when once established, is to draw towards itself all the political forces and functions of the community, so that, if no check were interposed, nothing at length could be done of which it was not the first mover. Among the obvious evils of such a state of things would be at once an undue and dangerous aggrandisement of the central authority, and an accumulation upon it of a much larger number of duties and offices than it can rightly discharge, in consequence of which many of them would be only performed in a slovenly and imperfect manner, while at the same time its proper province would also be partially neglected. We may venture to say that the supreme legislature of our own country has not a little embarrassed itself, and impaired its efficiency, by the multiplicity of matters, not necessarily requiring the fiat of an imperial authority, of which it has persisted in retaining the direction in its own hands. Nearly the whole of the vast amount of business, which every session occupies the time of both houses under the name of private bills, might undoubtedly, with great advantage, be devolved upon an inferior class of judicatories. Still, however, a very large share of what may with perfect propriety be called the government of the country, or the management of public affairs, is with us, and always has been, left to the care of subordinate or provincial bodies. We have both our county and our parish authorities in great numbers for the preservation of order, and also for the administration of justice, not only mediately but even in the last resort. The system may not in many respects be so perfect as it ought to be, or so well adapted as were to be desired to the circumstances of the present time, having originated, as it has done for the most part, in a remote and very different state of society; but with all its defects it is still of infinite service. The diffusion of political duties and political powers over every part of the body politic, is like the circulation of the blood throughout the natural body. It has a far higher value than its mere convenience in relieving the supreme legislature. It keeps up throughout the whole community that public spirit which is the life and health of a [illegible] preserves also that balance between the provinces and the chief seat of the government which would be [illegible] apt to be overthrown by the ascendency of [illegible] this way secures to every district of the country its due weight in the state and influence upon the public councils.

We shall not at present enter upon any inquiry into the

[Printed by WILLIAM CLOWES and SONS, Stamford Street.]

origin and history of our English municipal corporations, nor into all the purposes which they may have served, in additions to such uses as those to which we have just adverted, at their first rise or institution. It is sufficient for our immediate object, to remark that, whatever may have been the peculiar aid derived from them in sheltering and nursing our early liberties, their utility has by no means ceased even at the advanced stage which we have now reached. They are still needed to preserve what they were formerly instrumental in planting and rearing. They are still of inestimable importance as affording the means of giving effect to one of the heathiest principles of our English political organization, namely, that the government of the people should be left as far as possible in the hands of the people themselves

The leading aim of the present measure for the reform of these corporations may be shortly stated to be to open a free course for the operation of this great principle. It is to place the government of our towns really in the hands of the citizens themselves—to make them the guardians of their own property and pecuniary interests, their own magistrates, and their own justices of the peace. These rights and powers it confers upon them to the most liberal and ample extent, as will be seen from the analysis of the bill, to which we shall now proceed.

The recital in the preamble is as follows:—

"Whereas divers bodies corporate, at sundry times, have been constituted within the cities, towns, and boroughs of England and Wales, to the intent that the same might for ever be and remain well and quietly governed: and whereas, partly by defects in the charters by which the said bodies corporate have been constituted, partly by neglect and abuse of the privileges by such charters granted and confirmed to the inhabitants of the said cities, towns, and boroughs, and partly by change of circumstances since the said charters were granted, the said bodies corporate, for the most part, have not of long time been, and are not now useful and efficient instruments of local government."

The clause then proceeds to enact that so much of all laws, statutes, and usages, and so much of all royal and other charters, grants, and letters patent, now in force, relating to the several boroughs named in the annexed schedules (A) and (B), or to the inhabitants thereof, or to the several bodies or reputed bodies corporate therein named, or any of them, as are inconsistent with, or contrary to the provisions of the present Act, shall be repealed and nullified.

The second clause relates to the meaning in which various terms used in the act are to be understood; and the third may be called the incorporating clause, enacting that after the first election of councillors under the new act in any borough, the body corporate named in the schedules in connexion with such borough, shall take and bear the name of the mayor and burgesses of that borough, and by that name shall have perpetual succession, and shall be capable in law to do and suffer all acts which now lawfully they and their successors respectively may do and suffer, by any name or title of incorporation; and the mayor of each of the said boroughs shall be capable in law to do and suffer all acts which the chief officer of such borough may now lawfully do and suffer, so far as the same respectively are not altered or annulled by the provisions of this Act.

Clauses fourth and fifth relate to the boundaries of the boroughs, and enact that the metes and bounds of all those in the first section of the first and second divisions of schedule (A), and in the first section of schedule (B), that is, of all those included in the present act which now return members to Parliament, shall be the same as the limits thereof respectively settled and described in the Boundary Act for the election of members to serve in parliament (the 2 and 3 William IV. c. 64.),—and that the bounds of the others named in the two schedules shall remain the same as at present, until his Majesty shall otherwise determine by the advice of his privy council on the report of commissioners appointed by letters patent under the great seal.

Then come the clauses declaring who shall in future form the burgesses, or municipal constituency, of each borough: the most important of which, the great enfranchising clause, we give entire:—

"And be it enacted, that after the passing of this Act, every male person of full age, who, on the last day of August in any year shall have been an inhabitant householder within any borough, or within seven miles of such borough, and shall have occupied any house, warehouse, counting-house or shop within such borough during that year, and each of the two preceding years, and who shall have been rated, in respect of premises occupied by him, to all rates for the relief of the poor of some parish, wholly or in part within such borough, made in that year, and in each of the two years next preceding that year, shall, if duly enrolled according to the provisions hereinafter contained, be a burgess of such borough, and member of the body corporate of the mayor and burgesses of such borough; provided, that the premises in respect of the occupation of which any person shall be so rated need not be the same premises, or in the same parish, but may be different premises in the same parish or in different parishes; provided also, that every person who shall come to occupy any house, warehouse, counting-house or shop in any borough, during the time for which any rate for the relief of the poor shall have been made, to which he would have been rateable if he had been occupying there at the time such rate was made, may claim to be rated to such rate in respect of the property which he shall so come to occupy, and upon his so claiming and paying or tendering the amount of rate, if any, then due in respect of the premises, he shall be taken to have been rated to the relief of the poor in the parish in which such premises are situate, from the time at which the rate in respect of which he shall have made such claim shall have been made; provided also, that no person shall be so enrolled in any year who shall not have paid all such rates due from him at the time of the revision of the burgess roll, hereinafter provided, except such as shall have been made or become due within six calendar months next before such revision: provided also, that no person shall be so enrolled in any year, who within twelve calendar months next before such revision shall have received parochial relief or other alms, or any pension or charitable allowance from any fund intrusted to the charitable trustees of such borough hereinafter mentioned."

Three clauses that follow make certain additional regulations with regard to this household suffrage; the first directing that occupiers of houses, &c., wishing to enjoy the suffrage, may claim to be rated to the relief of the poor; and the second, that burgesses who cease to be occupiers within the borough, or neglect or refuse to pay their rates, shall be omitted from the burgess roll, but within two years may be restored at the next revision of the roll. The object of this latter enactment, which however will probably undergo some modification before the bill pass into a law, is to enable persons who, in consequence of absence from the borough, or any other similar cause, may have omitted for one year to pay their rates, to recover their elective privilege without working out over again the whole term of three years' residence and payments. The next clause enacts, that after the passing of the present Act no person shall be admitted a citizen, freeman, liveryman, or burgess of any borough, or by any name a member of any body corporate, except under the provisions of this Act. This clause disfranchises (and very properly) all the existing freemen in so far as any interference with the election of the governing body so concerned.

The tenth and eleventh clauses are very important, and we therefore give them entire:

"And whereas in divers cities, towns, and boroughs, a certain custom hath prevailed of taking or allotting the common lands and public stock of such cities, towns, and boroughs, and the rents and profits thereof, to and for the particular benefit, use, and enjoyment of the citizens, freemen, and burgesses of the said cities, towns, and boroughs respectively, or of certain of them, or of the widows or kindred of them, or of certain of them, and not applying the same to public purposes; be it therefore enacted, that after the passing of this Act no person shall have or be entitled to claim any share, benefit, or advantage of or from any of the lands, tenements, and hereditaments, or the rents and profits thereof, or of or from any common lands or public stock of the said body corporate, or any discharge or exemption from any tolls or dues lawfully levied, wholly or in part, by or to the use of any body corporate, who was not a citizen, freeman, or burgess of some borough, or the wife or widow of a citizen, freeman, or burgess of some borough on the 5th of June in this present year, and every person who was a citizen, freeman, or burgess of some borough, or the wife or widow of a citizen, freeman, or burgess of some borough on the said 5th day of June, shall have and enjoy the same share, be-

neſit, and advantage, of or from the lands, tenements, or hereditaments, or the rents and profits thereof, or of or from the common lands or public stock of any borough or body corporate, or from any discharge or exemption from any tolls or dues lawfully levied wholly or in part, by or to the use of any of the said boroughs or bodies corporate, and all benefit and advantage derivable therefrom, as fully and for such time and in such sort as he or she might and would have had and enjoyed the same if this Act had not passed, and no further or otherwise; provided, nevertheless, that after all the persons whose rights in this behalf are herein reserved shall have become entitled to be in actual possession of their share of the premises, the share, benefit, and advantage of or from the lands, tenements, and hereditaments, and the rents and profits thereof, or of or from the common lands or public stock of any borough or body corporate hereinbefore reserved to any person, shall accrue for the benefit of the borough fund of such borough, when and as soon as by any law, statute, charter, or usage in force on the day before the passing of this Act, such person would have ceased to have the benefit of the same if this Act had not been passed, and shall not survive and accumulate for the particular benefit of the other persons, or any of them, whose rights in this behalf are hereinbefore reserved as aforesaid."

"And whereas in divers cities, towns, and boroughs, a certain custom hath prevailed, that no person, not being free of a city, town, or borough, or of certain guilds, mysteries, or trading companies within the same, or some or one of them, shall keep any shop or place for putting to show or sale certain wares or merchandise by way of retail or otherwise, or use certain trades, occupations, mysteries or handicrafts for hire, gain or sale within the same; be it enacted, that every person in any borough may keep any shop for the sale of all lawful wares and merchandises by wholesale or retail, and use every lawful trade, occupation, mystery, and handicraft, for hire, gain, sale, or otherwise within any borough; any custom within such borough to the contrary notwithstanding."

Here we have the two great principles established, that for the future there shall be no appropriation of the public funds of boroughs to other than public purposes; and that all exclusive rights of trading hitherto enjoyed by the freemen of boroughs shall cease. The entire annual income of the 183 boroughs included in this Bill was stated by Lord John Russell, in the speech in which he introduced and explained the measure, to amount to not less than 367,000*l*. This is independent of the large revenues of the charity estates, of which the several corporations have been hitherto the managers, and in many instances the mismanagers. At present the expenditure of these corporations exceeds their income by about 19,000*l*. a year, and they are besides in debt to the amount of about 2,000,000*l*. sterling. It may be hoped that under the new system the means of paying off this heavy amount of debt will be gradually obtained, both through the sources of the incomes of the boroughs being by better management rendered more productive, and by their expenditure being diminished. The portion of the enactment quoted above, which reserves any claim they may have to a share in the public funds of their boroughs, to all freemen, and their wives or widows, who were such on the 5th day of June last (the day on which the Bill was brought into the House of Commons), takes away all ground of complaint against the present measure, as interfering with vested rights.

The machinery for carrying the enfranchising part of the measure into effect is the subject of the seven following enactments. The details, as proposed in this part of the Bill, may probably be altered in some respects before it passes into a law; and, therefore, we shall only at present notice its leading provisions. The overseers of the poor in every parish within a borough are directed on the last day of August in every year to make out an alphabetical list of all persons entitled to be enrolled in the burgess-roll, with the street or other place in the borough where the property is situated, for which each person is rated. These lists the overseers are to deliver to the town-clerk, and also to keep a true copy of them, to be perused by any person, without payment of any fee, at all reasonable hours during the first fourteen days of September in every year. Every person whose name shall have been omitted in these lists may claim to have it inserted by a notice delivered in to the town-clerk on or before the 15th of September; and objections to names as improperly inserted, are to be made in the same manner, and within the same time. The names of the claimants, and of the persons objected to, are then to be arranged by the town-clerk in separate lists, copies of which shall be fixed on or near the door of the town-hall, or in some public and conspicuous situation within the borough, during the week immediately preceding the first of October in every year; and other copies are to be kept by the town-clerk, to be perused by any person, without a fee, at all reasonable hours during the same week; and a copy of each is to be delivered to any person requiring it, on payment of a shilling. The mayor is then to hold an open court, for the purpose of revising the said lists, and settling, by the evidence of the overseers and others, what names ought to be retained and what omitted, some time between the 1st and the 15th of October inclusive. The mayor, who is thus by his sole authority to adjudicate upon every disputed claim, may adjourn the court from time to time as he sees fit, and may administer oaths to all persons called before him to give evidence in the case. Finally, the overseers' lists, after being thus revised, are to be delivered by the mayor to the town-clerk, who shall form all the names into one general alphabetical list, on or before the 24th of October; and this shall be the burgess-roll for every election of councillors that may take place during the following twelve months. Copies of the burgess-roll are to be printed and sold; and the expenses of the overseers are to be paid from the funds of the borough.

The enactments, from the 19th to the 40th inclusive, relate to the manner in which the mayor and council are to be chosen. In the first place the number of persons to be elected of the council in each borough is to be the number mentioned after the name of the borough in the annexed schedules (A) and (B). This number rises, it will be observed, in the case of some boroughs, so high as to 60 or 70, or even higher. Bristol is to have a council of 66, Leeds of 72, and Liverpool of 90 persons. It has been objected, with apparent reason, that assemblies of this magnitude for the government of boroughs are needlessly, and will probably be found to be inconveniently, large.

The following is the clause as to who shall be qualified to be chosen mayor or councillor:—

"And be it enacted, that no person shall be qualified to be elected or to be a councillor, or one of the charitable trustees hereinafter mentioned, of any such borough, who shall not be a burgess of such borough, or during such time as he shall hold any office or place of profit other than that of mayor in the gift or disposal of the council or charitable trustees of such borough, or during such time as he shall have directly or indirectly, by himself, or his partner, any share or interest in any contract or employment with, by, or on behalf of such council or charitable trustees."

The voters, as before stated, are to be all the burgesses whose names are on the burgess-roll for the time being. The election is to take place in open assembly on the 25th of October in every year (or if that day be a Sunday on the Monday following). At the first election under the new Act, the whole council will of course be chosen; but on every succeeding 25th of October, only one third part of the whole council for the time being shall go out of office, and only as many more shall be elected to fill their places. The council, it will be found by a reference to the schedules, is in all cases to consist of a number divisible by three. It is provided that those who shall go out at the termination of the first year shall be the councillors who were chosen at the first election under the Act by the smallest number of votes; those who go out at the end of the second year, they who on that occasion had the next smallest number of votes (disputed cases being determined by the vote of the majority of the council); "and, thereafter, those who shall so go out of office shall always be the councillors who have been for the longest time in office: provided always, that any councillor so going out of office shall be capable of being forthwith re-elected, if then qualified as herein provided."

At every election of councillors the mayor is to preside; the voting is to commence at nine in the morning, and to close at four in the afternoon; and shall be conducted in manner following; "that is to say, every burgess entitled to vote in the election of councillors may vote for any number of persons, not exceeding the number of councillors then to be chosen, by delivering to the mayor a voting-paper, containing the Christian names and surnames of the persons for whom he votes, with their respective places of abode and descriptions, such paper being previously signed with the

name of the burgess voting, and with the name of the street, lane, or other place in which the property for which he appears to be rated on the burgess-roll is situated."

The intention of this clause, as explained by Lord John Russell, is, that the voting shall be open, and, although some doubts have been expressed on the subject, it seems sufficiently to secure that object. Any voter will at least have it in his power to show, if he chooses, for whom he votes; and every man's vote will be known to the mayor, and to as many others as that officer pleases. Indeed, it has been intimated that a provision will be introduced into the act for the appointment of scrutineers to act along with the mayor. The clause does not indeed, as it stands at present, give all the world a right to know how every burgess has voted; but it may be doubted, if it be really desirable that all the world should have such a right.

At all contested elections, the mayor shall, if required by any candidate, or may, if it shall appear expedient to himself, cause booths for taking the poll to be erected in different parts of the borough, and appoint a clerk for each compartment of every booth.

The 26th clause is as follows:—

"And be it enacted, that no inquiry shall be permitted at any election of councillors as to the right of any person to vote as a burgess in any borough, except only as follows: that is to say, that the mayor shall, if required by any two burgesses entitled to vote in the same borough, put to any voter at the time of his delivering in his voting-paper, and not afterwards, the following questions, or any of them, and no other:—

"1. Are you the person whose name is signed to the voting-paper now delivered in by you?

"2. Are you the person whose name appears as A. B. on the burgess-roll now in force for this borough, being registered therein as rated for property described to be situated in ? [here specify the street, &c., as described in the burgess-roll.]

"3. Have you already voted at the present election?

"And if any person shall wilfully make a false answer to any of the questions aforesaid, he shall be deemed guilty of an indictable misdemeanor, and shall be punished accordingly."

The voting-papers, after being delivered in, are to be examined by the mayor and the scrutineers; and the mayor is then to declare such persons, equal to the number of councillors then to be chosen, as shall have the greatest number of votes, to be elected; and in case of an equality of votes for two or more persons, the mayor shall say which shall be chosen. He shall publish a list of the persons thus elected councillors before two o'clock in the afternoon of the day next after the day of election, unless such next day be Sunday, and in that case on the Monday following. In case the mayor shall be dead, absent, or otherwise incapable of acting, the councillors shall elect one of their own number as his substitute. Immediately after the first election under the new Act, it is ordered, that in every borough the existing mayor, aldermen, common councilmen, and all other members of the common council, or governing body of the body corporate, shall go out of office, and that their whole powers and duties shall cease, except that such of them as are justices of the peace in any borough shall continue to exercise their powers as such till the 1st of May, 1836.

The 30th clause and the four that follow it relate to a very important point,—the division of certain of the larger boroughs into wards, each of which shall separately elect its own councillors. The boroughs to be so divided are enumerated in the first division of schedule (A); and it is proposed that the division shall be made by his Majesty, by the advice of his Privy Council, on the report of commissioners appointed by letters patent under the great seal. The bounds of each ward, and the number of councillors to be chosen by it, are to be determined by the same authority, subject only to the restriction that the whole number of councillors for all the wards shall be the same as that mentioned after the name of the borough in the schedule. It has, however, been suggested that the division should be made by act of parliament, and it is possible that it may, in the end, be so arranged.

In the boroughs which are to be thus divided, the elections of councillors, as we have said, are to take place separately in each ward. At the first election after the division, the mayor shall appoint a person to preside; but the election in every succeeding year "shall be held before the councillor whom the councillors chosen in such ward shall yearly appoint in that behalf, who shall be called 'The Alderman' of such ward; and the votings and other proceedings, in all other respects, shall be conducted in the same manner as is hereinbefore declared with respect to elections by the burgesses of the whole borough: and the alderman of each ward shall have the same powers in regard to elections of councillors in his ward as are herein enacted with regard to the mayor for the whole borough, if not divided into wards; and every person so elected a councillor in such ward shall hold his office for the same time that he would have held it had he been elected by the burgesses of the whole borough."

The duties here mentioned are the only duties assigned to aldermen by the Act. There is to be no separate court of aldermen in any of the boroughs.

The following is the 32nd clause:—"And be it enacted, that every burgess of any borough shall be entitled to vote in the election of the councillors to be chosen within that ward in which the property of such burgess, for which he appears to be rated on the burgess-roll for the time being of such borough, shall appear to be situated, and not otherwise; and in case it shall happen that any burgess shall be rated in respect of distinct premises in two or more wards, then he shall be entitled to be enrolled and to vote in such one of the said wards as he shall select, but not in more than one."

By subsequent clauses, it is directed that the annual burgess-roll of every borough thus divided into wards shall thenceforward be made out in separate ward-lists; and that if any person shall be elected a councillor in more than one ward, he shall make his election for which he will serve within three days after notice thereof. All vacancies in the council, by whatever cause occasioned, are to be filled up by fresh elections, conducted exactly in the same manner as in the case of the general annual election.

The mayor of every borough is to be annually elected by the councillors from their own number on the day after they have themselves been elected. In case of a vacancy in this office within the year, a new election must be made within ten days thereafter. No person elected a mayor or councillor is to be capable of acting as such until he shall have made and subscribed a declaration in the words or to the effect following:—"I, A. B., having been elected mayor (or councillor) for the borough of , do hereby declare, that I take the said office upon myself, and will duly and faithfully fulfil the duties thereof according to the best of my judgment and ability." Every burgess elected councillor, and every councillor elected mayor, shall accept the office or pay a fine to the borough fund, unless disabled by lunacy, deafness, or some other permanent infirmity,—or unless he shall be above the age of sixty-five years,—or have already served the office, or paid the fine, within the five preceding years. Any person holding the office of mayor or councillor shall become disqualified, and shall cease to hold the office, on being declared bankrupt, or applying to take the benefit of the Insolvent Act, or being absent for more than one month (unless with the approbation of a majority of the council,) from the borough. Any person acting as mayor or councillor without having made the above-mentioned declaration, or without being duly qualified, or after he shall have become disqualified, shall forfeit a sum to be afterwards fixed, such sum, with full costs, to be recovered by any person who shall sue for the same within three months, one portion to go to the person so suing and the other to the borough-fund. It is, however, provided, "that all acts and proceedings of any person in possession of the office of mayor or councillor, and acting as a mayor or councillor, shall, notwithstanding such disqualification, be as valid and effectual as if such person had been duly qualified."

The clauses that immediately follow proceed to confer certain powers upon the mayor and council. By clause 41st, it is enacted that the mayor shall, in all cases, be a Justice of Peace both for the borough and for the county, and also of and for every county within seven miles of any part of the borough,—that he shall have precedence in all places within the borough—and that in boroughs which return a member or members to serve in Parliament, except the town of Berwick-upon-Tweed, and cities and towns which are counties of themselves, he shall be the returning officer at all such elections. The 42nd clause, giving power to

the council to appoint certain officers, is as follows:—"And be it enacted, that the council of every borough shall appoint, to be removable at their pleasure, a fit person, not being a councillor, to be the town-clerk of such borough, a treasurer of the borough, and such other clerks, collectors, and officers, as they shall think necessary for enabling them to carry into execution the various powers and duties vested in them by virtue of this Act; and shall take such security for the due execution of his office by any such treasurer, clerk, collector, or other officer, as the said council shall think proper; and shall order to be paid to the mayor, and to the town-clerk and treasurer, and to every such clerk, collector, and other officer to be employed as aforesaid, such salary or allowance as the said council shall think reasonable; and in case of a vacancy in any such office as aforesaid, by death, resignation, removal, or otherwise, the council of such borough may appoint another fit person in the place of the person so making such vacancy, provided that the town-clerk and treasurer shall not be the same person."

The treasurer is to pay no money except upon an order in writing signed by three or more councillors, and countersigned by the town-clerk. The treasurer, and every other officer appointed by the council, are, both during their continuance in office and within a certain time after going out, to deliver in accounts of all their receipts and disbursements on the order of the council; and the necessary means are provided for enforcing compliance with this important regulation.

By the 45th clause it is enacted, "that in the town of Berwick-upon-Tweed, and in the counties of the cities of Bristol, Canterbury, Chester, Coventry, Exeter, Gloucester, Lichfield, Lincoln, Norwich, Worcester and York, and in the counties of the towns of Caermarthen, Haverfordwest, Kingston-upon-Hull, Newcastle-upon-Tyne, Nottingham, Poole and Southampton, the council shall, on the first day of November in this and every succeeding year, name a fit person to execute the office of sheriff, with the like duties and powers as the sheriff, or the person filling the office of sheriff in the said town and counties respectively would have had if this Act had not passed."

The 46th clause enacts, that every borough in which a separate court of sessions of the peace shall be holden, as afterwards provided, shall appoint a coroner for the borough, to continue in office so long as he shall well behave himself. The borough-coroner is to have 20*s.* for every inquisition, and 9*d.* per mile for his travelling expenses, to be paid from the funds of the borough. In all other boroughs it is enacted that no person shall henceforth take any inquisition except the coroner for the county.

Clauses 48 and 49 relate to the removal of existing borough officers after the first election under the new act. Such officers are to continue to act, with their present salaries, &c., only until they shall be removed by order of the new council; but it is proposed that "every officer of any borough who shall be in office at the time of the first election of councillors under this act in such borough, and who shall be removed from his office as aforesaid, shall be entitled to have an adequate compensation, to be assessed by the council, and paid out of the borough fund, for the salary, fees, and emoluments of the office which he shall so cease to hold, regard being had to the manner of his appointment to the said office, and his term or interest therein, and all other circumstances of the case; and in case any such officer shall think himself aggrieved by the amount at which the council shall have assessed the compensation so to be paid to him, or in case one-third of the members of the council shall subscribe a protest against the amount of such compensation as excessive, it shall be lawful for such officer, or any councillor who shall have subscribed such protest to appeal to the Lords Commissioners of his Majesty's Treasury, who shall thereupon make such order as shall to them seem expedient; and such order, signed by three or more of the said Lords Commissioners, shall be binding upon all parties."

By clauses 50 and 51 it is enacted that all questions coming before the council shall be decided by the majority of the councillors present; that one-third of the whole number of councillors shall be a quorum; that the mayor, or in his absence his substitute elected by the meeting, shall have a casting vote in case of an equality of votes; that a notice of every meeting shall be affixed three clear days before on or over the door of the town-hall; that the mayor shall have power to call a meeting of the council as often as he shall think proper; that in case of his refusal to call such meeting on a requisition signed by five councillors, the said five councillors may call the meeting themselves; that a summons, specifying the business to be transacted at the meeting, shall always be left at the house of every member of the council three clear days at least before such meeting; that the council may appoint committees of their number, and may make bye-laws and regulations for their direction and government.

The 52d clause gives to the council of every borough to which there shall be granted a separate commission of the peace, the power, either by themselves or by a committee of their number, to license persons to keep ale-houses within the borough, at a special meeting held for that purpose in the month of September in every year. The councillors of any such borough are in this matter to act with all the powers of justices of the peace, as set forth in the Alehouse Licensing Act (the 3d Geo. IV. c. 77).

The clauses from the 56th to the 61st inclusive relate to the important subject of the administration of charitable trusts. The leading enactment upon this subject runs as follows:—"And whereas divers bodies corporate now stand seised or possessed of sundry hereditaments and personal estate, in trust in whole or in part for certain charitable trusts, and it is expedient that the administration thereof be kept distinct from that of the public stock and borough fund; be it enacted, that in every borough in which the body corporate, or any one or more of the members of such body corporate, in his or their corporate capacity, now stands or stand solely seised or possessed, for any estate or interest whatsoever, of any hereditaments or any sums of money, chattels, securities for money, or any other personal estate whatsoever, in whole or part, in trust or for the benefit of any charitable uses or trusts whatsoever, the council of such borough shall, on the 1st day of November in this and every succeeding year, nominate from among the burgesses of such borough a fit number of persons, not less than fifteen persons, of whom the mayor for the time being shall be one, who shall be charitable trustees for such borough, and the said trustees and their successors shall be one body corporate, by the name of The Charitable Trustees of the Borough of (as the case may be), and by that name shall have perpetual succession, and shall be enabled to sue and be sued in all courts and places of judicature within these realms, and shall stand seised and possessed of the said hereditaments, sums of money, chattels, securities for money and other personal estate, for such uses and trusts respectively as they were subject to before the passing of this Act, and shall have all the powers and liabilities heretofore vested in or belonging to such body corporate or in such member or members of such body corporate in respect of the said uses and trusts; and all the estate, right, interest and title, and all the powers of such body corporate or of such member or members of such body corporate other than the said charitable trustees appointed under the provisions of this Act, in respect of the said uses and trust, shall immediately thereupon utterly cease and determine."

The clauses that follow relate to the appointment of a secretary and other officers by the charitable trustees, and to other matters connected with their discharge of their office.

It is next enacted that the new council shall become trustees of all Acts of Parliament of which the bodies corporate to which they succeed were previously trustees, and that the powers now vested in trustees under sundry other acts of parliament, relating to the paving, lighting, &c., of the boroughs, may also be transferred by the said trustees to the new council.

The clauses from the 65th to the 76th inclusive contain the provisions according to which the council are to superintend the watching of the borough. They are immediately after their election to appoint a watch committee from their own number, of which the mayor shall be one; and this committee shall appoint a sufficient number of constables who shall act not only within the borough, but also within the county, and within every county being within seven miles of any part of the borough. The powers and duties of these constables are defined in general clauses, which, however, we must pass over for the present. Power is also given to any two of the justices of the peace having jurisdiction within the borough to appoint a certain number

of persons to act as special constables in case of need, each to be paid three shillings and sixpence for every day he is called out, from the funds of the borough. Provision is made for continuing the collection of all present rates for watching and lighting.

By the 77th clause the council are empowered to make such bye-laws as to them shall seem meet for the good rule and government of the borough; "provided that no such bye-law shall be of any force until the expiration of forty days after the same, or a copy thereof, shall have been sent, sealed with the seal of the said borough, to one of his Majesty's Principal Secretaries of State, and shall have been affixed on the outer door of the town-hall, or in some other public place within such borough; and if at any time within the said period of forty days, his Majesty, with the advice of his Privy Council, shall disallow the same bye-law, or any part thereof, such bye law, or the part thereof disallowed, shall not come into operation; provided also, that it shall be lawful for his Majesty, at any time within the said period of forty days, to enlarge the time within which such bye-law, if disallowed, shall not come into force; and no such bye-law shall, in that case, come into force until after the expiration of such enlarged time."

We give the 79th clause, relating to the appropriation of the income of the borough, and the power conferred upon the council of levying in certain cases a borough-rate, without abridgment:—"And be it enacted, that after the election of the treasurer in any borough, the rents and profits of all hereditaments, and all moneys, chattels, and valuable securities, belonging to any body corporate named in conjunction with the said boroughs in the said schedules (A and B), shall be paid to the treasurer of such borough, and every fine or penalty for any offence against this Act (the application of which has not been already provided for) shall be paid to such treasurer; and all the moneys which he shall so receive shall be carried by him to the account of a fund to be called the 'Borough Fund;' and such fund shall be applied, from time to time, towards the payment of the interest of any lawful debt due from such body corporate to any person, which shall have been contracted before the passing of this Act, and unredeemed, and subject thereunto, towards the payment of the salary of the mayor, and of the recorder hereinafter mentioned, when there is a recorder, and of the respective salaries of the town-clerk and treasurer, and of every clerk, collector, and other officer whom the council shall appoint, and also toward the payment of the expenses incurred, from time to time, in preparing and printing burgess-rolls and ward-lists, and notices, and in other matters attending such elections as are herein mentioned; and in boroughs which shall have a separate court of sessions of the peace, as is hereinafter provided, towards the expenses of the prosecution, maintenance, and punishment of offenders committed from the borough for trial at the sessions of the peace for such borough, and at the assizes for the county in which the borough is situate, and towards such other sum to be paid by such borough to the treasurer of such county, as is hereinafter provided, and towards the expense of maintaining the corporate buildings, and towards the payment of the constables, and of all other expenses, not herein provided for, which shall be necessarily incurred in carrying into effect the provisions of this Act. And in case such fund shall not be sufficient for the purposes aforesaid, the council of the borough is hereby authorized and required, from time to time, to estimate, as correctly as may be, what amount, in addition to such fund, will be sufficient for the purposes aforesaid. And in order to raise the amount so estimated, the said council is hereby authorized and required, from time to time, to order a borough-rate, in the nature of a county-rate, to be made within their borough; and for that purpose the council of such borough shall have within their borough all the powers which any justices of the peace assembled at their general or quarter-sessions in any county in England have within the limits of their commission, by virtue of an Act made in the fifty-fifth year of his late Majesty King George the Third, intituled 'An Act to amend an Act of his late Majesty King George the Second, for the more easy assessing, collecting, and levying of county-rates,' or as near thereto as the nature of the case will admit, except as is hereinafter excepted: provided that such council shall not be empowered to receive, hear, or determine any appeal against any such rate; and if any person shall think himself aggrieved by any such rate, it shall be lawful for him to appeal to the recorder, hereinafter mentioned, at the next quarter-sessions for the borough in which such rate has been made; or in case there shall be no recorder within such borough, to the justices at the next court or quarter-sessions for the county within which such borough is situate; and such recorder or justices respectively shall have power to hear and determine the same, and to award relief in the premises, as in the case of an appeal against any county-rate. And all such sums levied in pursuance of such borough-rate shall be paid over to the account of the borough-fund."

By subsequent clauses it is provided, that every year, on the 1st of September, two auditors, who are neither members nor officers of the council, shall be chosen by the burgesses;—that these, along with one of the councillors named by the mayor, shall, twice in every year, examine and audit the accounts, both of the treasurer of the council and the treasurer of the charitable trustees; and that abstracts of the accounts of both treasurers shall be annually printed and sold.

The latter part of the Bill consists of a long series of provisions relating to the administration of justice in the boroughs. There are no fewer than thirty-one clauses relating to this subject. We can only here notice some of the most material.

Those of the boroughs to which his Majesty shall at any time hereafter grant licence in that behalf are, from time to time, to name fit persons to receive the commission of justice of peace for the borough; and his Majesty thereupon may commission as many of the persons so named as he shall think fit. The crown may besides appoint one or more salaried magistrates (being barristers of not less than five years' standing) in any borough, the council of which shall pass a bye-law stipulating for the payment of the salaries. It is not to be necessary that the justices appointed under this Act should be qualified by estate, and they are not to sit in courts of gaol-delivery or quarter-sessions, nor to levy rates, nor grant alehouse-licences. The justices of the borough may appoint a clerk, who shall not be a councillor, or the town-clerk, or the clerk of the peace of the borough, nor any person concerned in the prosecution of offenders committed by the borough-justices.

Clause eighty-seventh relates to the appointment of a recorder, and the establishment of a separate court of sessions in certain boroughs: it is as follows:—

"And be it enacted, that the council of every borough which shall be desirous that a separate court of sessions of the peace shall be or continue to be holden in and for such borough, shall signify the same by petition to his Majesty in council, setting forth the grounds of the application, the state of the gaol, and the salary which they are willing to pay to the recorder in that behalf, and if his Majesty shall be pleased thereupon to grant that a separate court of sessions of the peace shall be thenceforward holden in and for such borough, his Majesty may appoint for such borough, or for any two or more of such boroughs conjointly, a fit person, being a barrister-at-law of not less than five years' standing, who shall be and be called the recorder of such borough or boroughs, and shall hold such office during his good behaviour; and his Majesty, upon any vacancy in any such office, may appoint another fit person, being a barrister-at-law of not less than five years' standing, to be the recorder in the place of the person so making such vacancy; and the recorder for the time being of any borough shall be a justice of the peace of and for such borough, and also of and for the county, within which such borough, or any part thereof respectively may be situated, and also of and for every county, within seven miles of any part of such borough, and shall execute the powers and duties of a justice of the peace for the same respectively, although he may not have such qualification by estate as is required by law in the case of any other person being a justice of the peace for a county; and such recorder shall have precedence in all places within the borough of which he may be the recorder, next after the mayor or thereof; and it shall be lawful for his Majesty to direct that an annual salary, not exceeding the sum stated in the petition of the council, shall be paid to such recorder by the treasurer of such borough, out of the borough fund: provided always, that no person, being such recorder as aforesaid, shall be a councillor or police magistrate of any borough of which he shall be recorder: provided also, that in every borough in and for which a separate court of sessions of the peace is now holden, and of which the present recorder or deputy recorder is a barrister of five years standing, the

council may signify in their petition, their desire that such recorder or deputy recorder, being qualified as aforesaid, shall be continued or appointed recorder under the provisions of this Act; and in every such case, if his Majesty shall be pleased to grant a separate court of sessions of the peace to such borough, the recorder or deputy recorder so named in the said petition, shall be the first recorder of such borough under the provisions of this Act."

Once in every quarter of a year at least, the recorder is to hold a court of session of the peace in and for the borough, of which court he shall sit as the sole judge: the mayor, however, in the absence of the recorder, is to open and adjourn the court.

By another clause capital jurisdictions, and all other criminal jurisdictions in boroughs, other than specified in this Act, are abolished.

In all boroughs which have not a separate court of the peace under the Act, the county justices are to have jurisdiction.

After a separate court of the peace has been granted to any borough, it shall be no longer lawful for the justices of the peace of the county to assess that borough to the county rates; but the expenses of the prosecution, maintenance, and punishment of all offenders committed for trial to the county assizes from the borough, shall be defrayed from the borough funds. Such boroughs are in the same manner to pay a proportion to be agreed upon of all other county expenditure.

Another clause (the ninety-eighth) provides for the continuance of the existing borough courts of record, and for the extension of their jurisdiction in certain cases. The council of the borough in which any court of record is held, is to appoint a registrar of such court, and the other necessary officers and servants.

The 101st clause, which appoints who shall be jurors in the borough courts, we give at length:—

"And be it enacted, that every person being a burgess of any borough wherein there shall be a separate court of sessions of the peace, or a court of record for the trial of civil actions (unless he shall be exempt or disqualified otherwise than in respect of property from serving on juries, by virtue of an Act passed in the sixth year of the reign of King George the Fourth, intituled 'An Act for consolidating and amending the Laws relative to Jurors and Juries,') shall be qualified and liable to serve on grand juries in such borough, and also upon juries, for the trial of all issues joined in any court of sessions of the peace, and in any court of record for the trial of civil actions, triable within the borough of which such person shall be a burgess; and the clerk of the peace of every such borough shall give public notice of the time and place of holding every such sessions of the peace ten days at the least before the holding thereof, and shall, seven days at the least before the holding thereof, cause to be summoned a sufficient number of persons, being qualified and liable as aforesaid, to serve as grand jurors at such sessions; and the clerk of the peace and registrar of the court of record respectively shall also cause to be summoned not less than thirty-six, nor more than sixty persons, so qualified and liable as aforesaid, to serve as jurors at every such sessions, and at the holding of every such court of record for the trial of causes; and such summons shall be made by showing to the person to be summoned, or, in case he shall be absent from the usual place of his abode, by leaving with some person therein inhabiting a note in writing, under the hand of such clerk of the peace, or registrar respectively, containing the substance of such summons; and such clerk of the peace shall make out a list of the names of such persons so summoned as grand jurors, and the clerk of the peace and registrar respectively shall also make out a panel of such persons so summoned other than grand jurors; and such list and panel shall respectively contain therein the Christian names and surnames, places of abode, and descriptions of the several persons therein named; and if any person, having been duly summoned to attend on any jury, shall not attend in pursuance of such summons, or, being thrice called, shall not answer to his name, or after his appearance, wilfully withdraw himself from the presence of the court, the court shall impose such fine upon every person so making default (unless some reasonable excuse shall be proved to the satisfaction of the court) as the court shall think meet; and if any person on whom such fine shall be imposed shall refuse to pay the same to the person who shall be authorised by the court to receive the same, it shall be lawful for the court then, or at its next sitting, by order of the court signed by the clerk of the peace or registrar respectively, to cause to be levied, by distress and sale of the goods of the person on whom such fine shall have been imposed, every such fine and the reasonable charges of such distress and sale; and every fine so received, shall be paid to the treasurer of the borough, to be by him carried to the account of the borough fund hereinbefore mentioned: provided nevertheless, that no person shall be summoned to serve as a juror at such sessions or court of record oftener than once in one year."

The borough councillors, justices of the peace, treasurers, and town-clerks, are exempted from serving on juries; and burgesses of boroughs which have quarter sessions are exempted from serving as jurors at county quarter sessions.

By other clauses it is ordered that the council shall, six months after their election, settle a table of the fees to be paid to the clerk of the peace, the clerk to the magistrates, and the registrar and officers of the court of record; and that copies of this table shall be hung up in the several courts.

Other clauses relate to the application of penalties, the limitation of time for the prosecution of offences punishable on summary conviction under the Act, the summoning of offenders, the summoning of witnesses, the competency of witnesses, the mode of levying penalties, the form of conviction, the right of appeal to the quarter sessions against summary convictions under the Act, the quashing of convictions for want of form, or their removal by *certiorari* or otherwise into any of the courts of Westminster (both which are prohibited), the venue in proceedings against persons acting in execution of the Act, the notice of action, the tender of amends, &c.

The 114th clause of the Bill is very important, and runs as follows:—

"And whereas sundry towns of England and Wales are not towns corporate, and it is expedient that several of them should be incorporated; be it enacted, that, if the inhabitants of any town in England and Wales should petition his Majesty to grant to them a charter of incorporation, it shall be lawful for his Majesty, by any such charter, to extend to the inhabitants of any such town all or any of the powers and provisions in this Act contained."

The concluding enactment is the usual one, that the Act may be altered or amended in the present session.

Since the above abstract was drawn up, the bill has been in part discussed by a Committee of the whole House, and a few alterations (chiefly affecting the phraseology) have been made in some of the clauses. We have thought it best, however, not to embarrass the present statement by any notice of what has been done in the course of a revisal which, at the time when we go to press, has only been carried over the first ten or twelve clauses of the bill. When the measure has passed through the Committee, we shall give an account of all the amendments that have been made upon it.

SCHEDULES TO WHICH THIS ACT REFERS.

SCHEDULE (A).

ENGLAND AND WALES.

BOROUGHS which are to have a COMMISSION of the PEACE.

DIVISION I.—BOROUGHS to be divided into WARDS:

Section 1.—Parliamentary boundaries to be taken—

Bath (48) mayor, aldermen, and citizens of the city of Bath.

Bristol (66), mayor, burgesses, and commonalty of the city of Bristol.

Exeter (42), mayor, bailiffs, and commonalty of the city of Exeter.

Kingston-upon Hull (48), mayor and burgesses of the town and borough of Kingston-upon-Hull.

Leeds (72), mayor, aldermen, and burgesses of the borough of Leeds, in the county of York

Leicester (45) mayor, bailiffs, and burgesses of the borough of Leicester.

Liverpool (90), mayor, bailiffs, and burgesses of the borough of Liverpool.

Macclesfield (39), mayor, aldermen, and burgesses of the borough of Macclesfield.

Newcastle-upon-Tyne (51), mayor and burgesses of the town of Newcastle upon-Tyne, in the county of the town of Newcastle-upon-Tyne.

Norwich (54), mayor, sheriffs, citizens, and commonalty of the city of Norwich.

Nottingham (54), mayor and burgesses of the town of Nottingham.

Portsmouth (46), mayor, aldermen, and burgesses of the borough of Portsmouth, in the county of Southampton.

Preston (42), mayor, bailiffs, and burgesses of the borough of Preston, in the county palatine of Lancaster.
Stockport (45), mayor, aldermen, and burgesses of the borough of Stockport.
Sunderland (45), mayor, aldermen, and commonalty of the borough of Sunderland.
Worcester (36), mayor, aldermen, and citizens of the city of Worcester.
Yarmouth Great (36), mayor, aldermen, burgesses, and commonalty of the borough of Great Yarmouth, in the county of Norfolk.
York (36), mayor and commonalty of the city of York.

Section 2. Boundaries to be declared by the King in Council—

Coventry (36), mayor, bailiffs, and commonalty of the city of Coventry.
Plymouth (39), mayor and commonalty of the borough of Plymouth.

Division II.—Boroughs not to be divided into Wards:

Section 1.—Parliamentary boundaries to be taken—

Aberystwith (18), mayor and burgesses of the town, borough, and liberty of Aberystwith.
Abingdon (21), mayor, bailiffs, and burgesses of the borough of Abingdon.
Andover (18), bailiff, approved men, and burgesses of the borough of Andover.
Banbury (21), mayor, aldermen, and burgesses of the borough of Banbury, in the county of Oxford.
Barnstaple (21), mayor, aldermen, and burgesses of the borough and parish of Barnstaple, in the county of Devon.
Bedford (21), mayor, bailiffs, and burgesses of the town of Bedford.
Beverley (24), mayor, aldermen, and burgesses of the borough of Beverley, in the county of York.
Brecon (21), bailiff, aldermen, and burgesses of the borough of Brecon.
Bridgewater (21), mayor, aldermen, and burgesses of the borough of Bridgewater.
Bridport (21), bailiffs and burgesses of the borough of Bridport.
Bury St. Edmund's (27), aldermen and burgesses of Bury St. Edmund's, in the county of Suffolk.
Cambridge (33), mayor, bailiffs, and burgesses of the borough of Cambridge.
Canterbury (30), mayor and commonalty of the city of Canterbury.
Cardiff (21), bailiffs, aldermen, and burgesses of the town of Cardiff.
Carlisle (33), mayor, aldermen, bailiffs, and citizens of the city of Carlisle.
Carmarthen (24), mayor, burgesses, and commonalty of the borough of Carmarthen.
Carnarvon (21), mayor, bailiffs, and burgesses of the town and borough of Caernarvon.
Chester (33), mayor and citizens of the city of Chester.
Chichester (21), mayor, aldermen, and citizens of the city of Chichester.
Colchester (30), mayor and commonalty of the borough of Colchester.
Dartmouth (18), mayor, bailiffs, and burgesses of the borough of Clifton Dartmouth Hardness, in the county of Devon.
Derby (36), mayor, aldermen, and burgesses of the borough of Derby.
Devizes (21), mayor and burgesses of the borough of Devizes.
Dorchester (18), mayor, bailiffs, aldermen, and burgesses of the borough of Dorchester, in the county of Dorset.
Dover (30), mayor, jurats, and commonalty of the town and port of Dover.
Durham (24), mayor, aldermen, and commonalty of the city of Durham and Framwelgate.
Gateshead (30), borough holders and freemen of the borough of Gateshead.
Gloucester (27), mayor and burgesses of the city of Gloucester, in the county of the city of Gloucester.
Guildford (18), mayor and burgesses of the town of Guldeford, in the county of Surrey.
Harwich (18), mayor and burgesses of the borough of Harwich.
Haverfordwest (21), mayor, sheriffs, bailiffs, and burgesses of the county of the town of Haverfordwest, or of the town and county of the town of Haverfordwest.
Hereford (27), mayor, aldermen, and citizens of the city of Hereford.
Ipswich (33), bailiffs, burgesses, and commonalty of the town or borough of Ipswich.

Wenlock (27), burgesses of the borough of Wenlock.
Wisbech (21), burgesses of the borough of Wisbech.

SCHEDULE (B).

ENGLAND AND WALES.

BOROUGHS which have not a COMMISSION of the PEACE, unless on Petition and Grant.

Section 1.—Parliamentary Boundaries to be taken—

Cardigan (18), mayor, common council, and burgesses of the town and borough of Cardigan.
Denbigh (18), aldermen, bailiffs, and burgesses of the borough of Denbigh.
Evesham (18), mayor, aldermen, and burgesses of the borough of Evesham.
Maldon (18), mayor, aldermen, and capital burgesses and commonalty of Maldon.

Section 2.—Boundaries to be settled by the King in Council—

Arundel (15), mayor and burgesses of the borough of Arundel.
Basingstoke (18), mayor, aldermen, and burgesses of the town of Basingstoke, in the county of Southampton.
Beaumaris (15), mayor, bailiff, and burgesses of the borough of Beaumaris.
Beccles (18), portreeve, surveyors and commonalty of the Fen of Beccles, in the county of Suffolk.
Bewdley (21), bailiffs, burgesses, and inhabitants of the town and borough of Bewdley.
Bodmin (21), mayor and burgesses of the borough of Bodmin, in the county of Cornwall.
Buckingham (18), bailiff and burgesses of the borough and parish of Buckingham, in the county of Buckingham.
Calne (15), guild stewards and burgesses of the borough of Calne.
Chard (15), portreeve and burgesses of the borough of Chard, in the county of Somerset.
Chesterfield (21), mayor, aldermen, and burgesses of the borough of Chesterfield.
Chippenham (18), bailiffs and burgesses of the borough of Chippenham, in the county of Wilts.
Chipping Norton (15), bailiffs and burgesses of the borough of Chipping Norton, in the county of Oxford.
Daventry (18), bailiffs, burgesses, and commonalty of the borough of Daventry, in the county of Northampton.
Droitwich (18), bailiffs and burgesses of the borough of Wych, otherwise Droitwich, in the county of Worcester.
Eye (15), bailiff, burgesses, and commonalty of the town and burgh of Eye.
Faversham (18), mayor, jurats, and commonalty of the town of Faversham.
Folkestone (18), mayor, jurats, and commonalty of the town of Folkestone.
Flint (15), mayor, bailiffs and burgesses of the borough of Flint.
Glastonbury (15), mayor and burgesses of the town of Glastonbury, in the county of Somerset.
Godalming (18), warden and inhabitants of the town of Godalming.
Godmanchester (15), bailiffs, assistants and commonalty of the borough of Cirencester, alias Godmanchester.
Helstone (18), mayor and commonalty of the borough of Helston.
Henley-upon-Thames (15), mayor, aldermen, bridgemen, and burgesses of Henley-upon-Thames.
Huntingdon (21), mayor, aldermen, and burgesses of the borough of Huntingdon.
Hythe (15), mayor, jurats, and commonalty of the town and port of Hythe, in the county of Kent.
Llanidloes (15), mayor and burgesses of the borough of Llanidloes.
Launceston (15), mayor and commonalty of the borough of Dunncheved, otherwise Launceston.
Lyme Regis (15), mayor and burgesses of the borough of Lyme, in the county of Dorset.
Lymington (15), mayor and burgesses of the borough of Lymington.
Machynlleth.
Maidenhead (15), mayor, bridgemasters, and burgesses of the town of Maydenheth.
Malmesbury (18), aldermen and capital burgesses of the borough of Malmesbury.
Marlborough (18), mayor and burgesses of the borough and town of Marlborough, in the county of Wilts.
Morpeth (18), bailiffs and burgesses of the borough of Morpeth, in the county of Northumberland.
Penryn (21), mayor and burgesses of Penryn, in the county of Cornwall.
Radnor, New (15), bailiff, aldermen, and burgesses of the borough of New Radnor.
Retford, East (15), bailiffs and burgesses of East Retford, in the county of Nottingham.
Ruthin, aldermen and burgesses of the borough of Ruthin.
Rye (18), mayor, jurats, and commonalty of the ancient town of Rye.
Sandwich (18), mayor, jurats, and commonalty of the town and port of Sandwich, in the county of Kent.
Shaftesbury (18), mayor and burgesses of the borough of Shafton, otherwise Shaftesbury, in the county of Dorset.
Southwold (15).
South Molton (18), mayor and burgesses of the borough and parish of South Molton, in the county of Devon.
Stockton (15), mayor, aldermen, burgesses, and commonalty of the borough of Stockton.
Stratford-on-Avon (18), mayor, aldermen, and burgesses of the borough of Stratford-upon-Avon.
Sutton Coldfield (18), warden and Society of the royal town of Sutton Coldfield.
Tamworth (18), bailiffs and commonalty of the borough of Tamworth.
Tenby (15), mayor, bailiffs, and burgesses of the borough of Tenby.
Tenterden (18), mayor, jurats, and commons of the town and hundred of Tenterden, in the county of Kent.
Thetford (18), mayor of the borough of Thetford.
Torrington (18), mayor, aldermen, and burgesses of the borough and town of Great Torrington, in the county of Devon.
Totnes (18), mayor and burgesses of the borough of Totnes, in the county of Devon.
Wallingford (15), mayor, burgesses, and commonalty of the borough of Wallingford.
Wycombe, Chepping (18), mayor, bailiffs, and burgesses of the borough of Chipping Wycombe (otherwise Wicombe), in the county of Buckingham.
Yeovil (15), portreeve and burgesses of the borough of Yeovil, in the county of Somerset.

AMENDMENT OF THE MARRIAGE LAW.

FROM various measures which are either already before the legislature, or which have been announced as about to be brought forward, it appears that the attention of the public is likely to be immediately called to more than one branch of that important, extensive, and complicated subject, the Marriage Law. Besides the great question of the marriages of dissenters, which must be set at rest as soon as possible, there is the motion of which Lord Brougham has given notice for a revision of the whole marriage law of Scotland, and there is also the bill which has been brought into the House of Lords by Lord Lyndhurst, for amending in certain respects the law respecting marriages contracted by persons within the prohibited degrees. But valuable as the partial improvements thus contemplated may be in themselves, it may be hoped that they will work still greater benefit by leading eventually, through the general attention to the subject which they will excite, to a revision and consolidation of the whole of our law of marriage, which in almost all its parts is in the most perplexed and unsatisfactory state. If we had to begin upon an entirely new foundation, this subject, considered as a matter of legislation, would not present any inherent difficulties of much consequence. But our existing marriage law is a mass of confusion and uncertainty, in consequence of the irregular manner in which it has been allowed to grow up, and the inefficiency of the arrangements that have been made from time to time to meet the emergencies that have arisen. The principal points in which the law requires amendment may be thus enumerated:—

1. The law as to the parties between whom, in any circumstances, marriage may take place and subsist, ought to be revised. The canon law has adopted upon this head the ordinances of the Levitical law, and has even extended the prohibition against the marriages of kindred in some cases beyond the limits laid down by the Jewish legislator.

This portion of the canon law is understood to have been received into the law of England by a statute of Henry the Eighth. By this statute also all questions relating to marriage have been placed under the jurisdiction of the Ecclesiastical courts. In the course of the contest, however, between the principles of the ecclesiastical and of the civil law, some strange and almost contradictory results have evolved themselves. For instance, while, on the one hand, a marriage between persons within the prohibited degrees is held to be so far illegal, that, if proceeded against in the ecclesiastical courts by parties competent to stir in the matter, it must be dissolved, it is held to be so far legal on the other hand, that it will stand good to all intents and purposes if not so questioned, or even if either of the parties to it should die before a decision shall have been pronounced in the case. Thus, of three such marriages it may happen, that the first shall never be questioned at all, there being either no parties in existence that have a right to proceed against it, or the persons that have such a right neglecting to exercise it, or being disinclined to do so, or being bribed or otherwise induced to remain quiet: that a suit shall be brought to dissolve the second, which however shall be interrupted and put an end to before judgment has been pronounced, by the death of one of the parties to the marriage, in both which cases the children of the marriage shall be legitimate, shall inherit property, and shall enjoy all the other rights of legitimacy; while the third marriage shall be dissolved, and the issue bastardised. No length of time during which the marriage may have subsisted is here any protection either to the parents or their children; nay, either of the parents may, when he or she pleases, desert the other, and their common offspring, and by his or her own agency procure a dissolution of the marriage. One result of this contradictory state of the law is, that such marriages have come to be not very unfrequently contracted. As the law only censures and dissolves them, when it has as it were been forced to notice them, and in all other cases not only tolerates them, but accords them its sanction and protection, it is natural that their immorality should often be considered as rather artificial or accidental than real. In so far as they are essentially immoral and wrong, such a misapprehension is undoubtedly a very great evil: and it would be no slight evil, even if it should be alleged that the thing in question was in some of its forms only made wrong by the declaration of the law. The object of Lord Lyndhurst's bill is to legalize all marriages of this description that now subsist; in other words, to place the few against whom libels have been, or, in the present state of the law would be, exhibited in the ecclesiastical courts, in the same secure position with the much greater number that have not been, and never will be so assailed. But, although such a measure will be no more than an act of justice in so far as it goes, it will be far from placing this part of the law of marriage on the foundation on which it ought to stand. For the future it will be necessary to declare what marriages shall be legal, and what shall be illegal, in all circumstances. As, however, to prohibit absolutely all such marriages as may now only be dissolved by a process which is much more frequently neglected than resorted to, would be greatly to increase the severity of the present law; it will probably be found expedient to reconsider the whole law of marriages within the prohibited degrees, with a view to its relaxation in such of its enactments as may be found least accordant with modern feelings and opinions. It may be safely announced that few intelligent persons will now think it requisite that this matter should be regulated in our times in England simply according to the ceremonial institutions of the Jews. The considerations which make marriages between persons nearly related to each other improper may be either physiological or moral. In a large class of such marriages, namely, those between persons connected with each other by what the lawyers call *affinity*, that is, relationship not of blood but by marriage, the physiological objection does not exist. In regard to those therefore it only remains to consider what is the value of the moral objection. The principle of the canon law, and also that of the present law of England, is, that, when a man and a woman marry, all the relations by consanguinity of each become the relations in the same degree of the other, and no marriage can ever afterwards take place within the prohibited degrees between either and the new relations thus acquired. It is in this way that a man is prevented, for instance, after the death of his wife, from marrying her sister, or her niece, or rather that such a marriage, if it be made, is liable to be dissolved by a judgment of the ecclesiastical courts. In revising this part of the law it may be matter for consideration whether the principle in question might not with advantage be relaxed in some degree. But at all events it will hardly be disputed that, whatever rule shall be laid down, it ought to be one, framed, not merely for the accommodation of certain individuals, but with the view of preventing generally the offences against which it is directed. The marriages which it is held desirable to prohibit should be declared illegal, and as such null and void, whether they be questioned or not.

2. The next part of the law of marriage that requires revisal is that which relates to the celebration of the ceremony, or the manner of giving legal effect to the contract. This embraces of course the question of the marriages of the great body of dissenters, whom nothing has yet been done to relieve from the necessity of having their marriages performed according to the ritual of the established church, and also whatever points may still remain undetermined in regard to the marriages of Jews, of Quakers, and of Catholics in Ireland, who have been at least partially exempted from that necessity. Undoubtedly, the form which alone the law requires ought to be one perfectly unobjectionable to all religious sects—the members of each of which should be left to add whatever further ceremony they may severally think fit. Some regular form the state is entitled to demand in order to secure the publicity of a transaction which it undertakes to maintain, and which is deeply interesting in its consequences to many persons besides the actual parties to it; but more than is sufficient for that end the state has no right to insist upon.

3. A large portion of the perplexity of the present marriage law of this country arises from the discordance that there is between the law of England and the law of Scotland on this subject. What makes a marriage in Scotland does not make a marriage in England, and what dissolves a marriage in the former country does not dissolve it in the latter. But as the two countries are perfectly united, and the natives or inhabitants of both are in all respects equal in the eye of the law, it has been generally supposed that any legal act done in the one is binding also in the other. Thus, a marriage between two natives of England, performed in Scotland, and according to the Scottish form (which is scarcely any form at all), is commonly held to be a good marriage even in England, although it may have been effected in evasion, or in direct defiance of the law of that part of the kingdom; and in like manner, if an English married couple can contrive to get themselves divorced in Scotland, (where that process also is a very easy and expeditious one,) it is contended by many that the marriage is equally to all intents and purposes dissolved in England. Even if all the points thus arising were clearly and incontrovertibly settled, the inconvenience and evil would obviously be very great of having two codes of law respecting such a matter thus clashing with and running counter to each other—two sets of rights, two sets of duties and obligations, the choice of the one of which amounts (for this is really the fact) to a direct rejection of, and rebellion against the other, while yet everybody is allowed to choose which he pleases. It is plain that no law upon the subject at all, or at least no second law affecting to restrict the greater liberty given by the first, would be preferable to such a state of things. In that case the law, such as it was, would at least be obeyed, which now it is not except by such as choose, and by those who cannot afford the expense of a journey to Scotland to escape from its jurisdiction. But this is only a part, and a small part of the evil. Notwithstanding many decisions, several most important points, arising out of the conflict of the two laws, must still be considered as by no means settled; and as cases attended with new circumstances present themselves, new doubts and puzzles are constantly turning up. We do not yet know the whole force and effect in England, either of a Scotch marriage or of a Scotch divorce. Would the former legitimize children previously born to the parties in England, as it undoubtedly would do their children so born in Scotland? Would it in all cases entitle even the children born subsequent to it to inherit English property and English honours? Suppose the case of a nobleman holding a Scotch and English title, both descendible to his eldest son, to have married a woman by whom he leaves one son born before marriage and another after it, would his Scotch peerage fall to the former and his English to the latter? or would the former

inheritance, or would anything depend upon the circumstance of whether the eldest son was born in Scotland or in England? We believe any one of these questions might yet give rise to much litigation. The effect of a Scotch divorce, in the case of an English marriage, is perhaps still less ascertained. Does it really dissolve such a marriage to all purposes, or even to any purpose? Is either party, after obtaining such a divorce, perfectly safe in contracting a new marriage? Suppose the woman so divorced were afterwards to have a child under circumstances under which in ordinary cases the law would or might presume that it was her first husband's, would the fact of the Scotch divorce take that case out of the ordinary rule, or might not the child so born still take that husband's name, and claim to inherit his property or his honours? We need not say that cases involving such questions as these, are, in the present state of the law, by no means of unlikely occurrence.

4. The operation of marriages between English subjects, performed abroad or in certain of the colonies, is another matter which might also perhaps in some respects be found to require clearing up. There is more difficulty than there appears to be at first sight in the application of the principle commonly recognized, that a marriage which would be accounted good in the country where it took place, must be accounted, to all intents and purposes, good here also. We have seen that even in the case of Scotch marriages, it is still somewhat doubtful if this principle is to be regarded as holding to its full extent. But two English subjects may get themselves married, or what they call or one of them calls married, in a country where the business is commonly gone about with even still less of form than the law demands in Scotland. For example, what would the English courts say to a marriage said to have taken place between two of his Majesty's subjects, while residing with some tribe of negroes in the interior of Africa, or among the savages of New Zealand—where perhaps no particular form at all may be observed—or the form may be one altogether revolting to our notions—such as the forcible abduction of the woman, or even the compulsory union of the two, without the consent, at the time, of either? Would such a marriage stand good here on the ground that it was good in the country where it was thus unceremoniously or barbarously solemnized? Again, is it quite determined in what manner an Englishman must be married even in some of our own colonies, or foreign possessions? In India, for instance, where a branch of the church has been established, would marriages performed by all descriptions of dissenting clergymen be valid? or might Scotch residents be married, as in their own country, without a clergyman at all? or runaway English couples by a blacksmith, as they do at Gretna Green? or, finally, would a marriage between English people, solemnized there according to the ritual of the Mahometans or the Hindoos, be held by the English law to be in all respects a proper English marriage?

5. In the present state of the law almost as many questions might be raised about what dissolves as about what makes a marriage. We have already slightly touched upon this head in noticing the discrepancy between the English and Scotch laws of marriage: but the whole difficulty does not arise from that. Can an English marriage, in fact, be completely dissolved, that is, so as to leave the parties at liberty to marry again, by a judgment of the law authorities of any other country? or if a judgment of the Scotch courts is to be held as having this force, in consequence of the union and incorporation of the two countries, is a divorce obtained in a foreign country to be equally effectual? or is the rule to be that a marriage, universally, can only be dissolved by the same law according to which it was constituted—English marriages by the English law, Scotch marriages by the Scotch law, French marriages by the French law, &c.? Or would parties, who had been married elsewhere, be allowed, so long as they resided in England, to avail themselves even of the right which that rule would give them? Would a Scotch or a French divorce dissolve even a Scotch or a French marriage in England?

6. In the general consolidation and amendment of the law of marriage, the principles of the present law, as to the nature and effect of marriage, might perhaps in some respects be advantageously altered and liberalized. In particular, it might be worth consideration, whether on the one hand the rule of the canon law ought not to be adopted according to which children previously born become legitimate on the marriage of their parents, (as is at present the case in Scotland,) and on the other, whether the complete dissolution of a marriage for sufficient reasons might not be allowed to be effected without the necessity of a resort to Parliament—a remedy, in many respects, of the most objectionable description.

THE DANISH CLAIMS.

The subject of what are called the *Danish Claims*—that is, the claims of certain British merchants for compensation on account of losses sustained in consequence of the attack made on Denmark by this country in 1807—is about to be this session again brought before Parliament by Mr. Hutt, one of the members for Hull. The honourable gentleman has, without naming any particular day for his motion, given notice that he will call the attention of the House of Commons to these claims, as far as relates to ships, cargoes, and goods, on the House going into a Committee of Supply.

In 1807, whilst England and Denmark were at peace, with very extensive mercantile dealings between the countries, and ambassadors residing at the respective courts, the English Government, from an apprehension that the Danish fleet then lying at Copenhagen might be made use of by Buonaparte in his war against this country, sent out a secret expedition to take possession of that fleet without a previous declaration of war, or any aggression committed by the Danish Government. The object of the expedition was accomplished, and war ensued between the countries. The immediate consequences of that war were the confiscations of British and Danish property in the respective hostile countries; of Danish to the amount of nearly a million and a half, which became droits of the Admiralty; and of English, from which the present claims originate, to the amount of about 100,000*l.*

Whether the conduct of the British Government towards Denmark was justifiable or not, is immaterial with reference to the justice of the present claims. The suddenness of the unprecedented attack on that country, which allowed of no precautionary measures being taken by persons who had property in Denmark, with the large amount of Danish property confiscated in England, which afforded ample means for compensating those persons for the loss of that property, may be held to justify a part of that property being so appropriated, more especially as this Government promised to reserve a portion of the droits so acquired as a fund for the compensation of claimants.* Able reasoners have maintained, indeed, that 'the only ground on which the disposal of droits being left to the crown was justified, was that they should be kept as a fund for compensating British subjects for losses sustained at the breaking out of a war.' (*Speech of Mr. Warburton in the House of Commons on 4th July*, 1828.) The claims in question not only come within the rule thus laid down, but if necessary it might be contended that as the attack, from its unprecedented character, could not have been foreseen or guarded against by the caution of the most prudent merchant, the claimants would on that ground be entitled to compensation out of the public purse. This, however, is unnecessary, as there was an ample fund from which to make them compensation.

When the expedition against Copenhagen was determined upon by this Government, it followed that all British property in Denmark subject to confiscation by the law of nations, would be sequestrated as soon as that determination became known to the government of the latter country; and admitting it to have been impracticable, consistently with the success of the expedition, to give notice to British merchants to withdraw their property, yet it was certainly a matter of peculiar hardship, and of dangerous refinement in government stratagism, that after the expedition had been determined upon, there not only was no publicity given to that determination, but Admiralty licenses were granted to British merchants freighting vessels to Denmark, down to, and even subsequently to the sailing of the expedition. This deception—for even if justifiable it was nothing else—seems to place the sufferers in the most favourable position to entitle them to compensation out of the before-mentioned droits of the Admiralty, or out of the public purse if those droits are disposed of.

Such is one ground on which compensation is claimed

* See Resolutions of public meeting of claimants on 26th January, 1829.

for all kinds of British property confiscated in Denmark, whether sent there before or after the expedition in question was determined upon. But one class of the claimants have not only this general ground of justice to entitle them to compensation out of the Admiralty droits, but from the unprecedented conduct pursued towards them by the Danish government, against the law of nations, their claims should have been provided for by the government so offending against national law, before peace was concluded with that government. This is the principle recognised and adopted between nations, and if the British Government neglected to take care of the interests of its subjects, they have a right to compensation out of the public purse.

This last-mentioned class of claimants consist as well of the owners of English good son shore in Denmark, as of the merchants to whom book debts were owing by Danish subjects on the breaking out of the war; for the Danish government, exasperated by the nature of the attack on the part of this country, did not confine itself to seizing the description of property which, according to national law, was liable to confiscation, but confiscated also goods on shore, the property of English subjects, contrary to the common usage of nations; and after issuing an ordinance of 9th September, 1807, requiring its subjects to return into the Treasury a list of all book debts due to British subjects, gave discharges for the amount of the debts so given in.

There can be no doubt whatever as to the illegality of the conduct of the Danish government in these proceedings. Lord Ellenborough, in delivering judgment in the Court of King's Bench in 1816, upon an action brought by a British creditor against a Danish debtor who happened to come to this country, said, 'that such confiscation was not general at any period of time; that no instance of it, except the ordinance in question, was to be found for more than a century; and that the judgment of the court would be pregnant with mischief to future times, if they did not declare the ordinance and the payment under it did not furnish a defence to the action.' (*Maule and Selwyn's Reports*, vol. vi. p 106.) On the subject of the confiscation of the goods on shore which were confiscated by the Danish government, we have seen an opinion of Dr. Lushington to this effect,—'That it is not the common usage on the breaking out of war to seize the goods on shore of private individuals, subjects of the state become hostile. In this respect *I think there is no essential distinction between goods seized on shore and book debts;* nor do I see any just cause for holding that goods were not equally comprehended with book debts within the third additional article of the Treaty of Kiel. I think goods seized on shore were within the treaty.'

Upon the ordinance in question being made, and all the goods on shore being seized, the claimants appointed a committee, of which the late Sir Charles Price was the chairman, to communicate with the Government of this country with the view to procuring compensation for their losses. Their claim was met by ministers alleging that to grant compensation at that time would be recognising the legality of the ordinance and seizure; but although no immediate relief could be given, yet that *no treaty of peace would be made with Denmark until the property so illegally confiscated was compensated for.*

We by no means admit the validity of the reason here advanced by Government, as it must be obvious that, although it had at once compensated the claimants, the doing so, whilst it probably would have saved from ruin many respectable individuals, could not have operated to prevent the Government from insisting on compensation from Denmark before making peace with that country. If the objection was started merely to keep the Admiralty droits at the disposal of Government, by postponing the compensation until peace between the countries, the object has been tolerably well accomplished. Nearly thirty years have elapsed without the claimants having procured any compensation; and now that many of them are dead, and many are altogether ruined, there appears to be some disposition altogether to avoid making any compensation, in consequence of the lapse of time since the losses were sustained. Such a result could never have been anticipated when the answer of the Government was first received. However, the objection had the effect of inducing the claimants to desist from urging their claims at the time, and to depend on the Government procuring them justice as soon as possible.

In 1814 a treaty of peace was concluded between this country and Denmark; and the British sufferers having, from the representations of Government during the preceding seven years, looked forward to that event, as the means of enabling the Government to get justice done them, applied to know how their claims had been provided for. In answer to the application, a letter was received from the Privy Council, dated the 20th September, 1814, which stated 'that the treaty contained an article on the subject of sequestrations,' and the parties were instructed how to proceed respecting them.

Incredible as it may appear, it was found on reference to the article referred to in the treaty, that so far from taking care of the interests of the British claimants, by securing compensation from the Danish government for the illegal confiscations, the treaty of peace actually precluded the possibility of justice being done to them, by recognising the legality of the confiscations made by the Danish government, and by handing over the claimants for justice to the Danish law courts. The eleventh article of the treaty declared, 'that all sequestrated property, *not already confiscated*, should be restored on each side.' The effect of this was to recognise what had been confiscated, and it may be fairly concluded that, after the lapse of seven years, all the property was confiscated, and that the words were introduced to give a colour to the transaction.

Let us pause here for a moment to notice the situation of the Danish debtor. Many of these debtors—some of them from preferring that the money should remain in their own pockets, others rightly conceiving that the before-mentioned Danish ordinance, being at variance with the law of nations, would be no defence to an action by a British creditor—had omitted to pay the amount of their debts into the Danish Treasury; but as soon as the nature of the article in the treaty of peace was known, they in great numbers hastened to get discharges for their debts, before the treaty was ratified. These discharges were procured by payment of from one to two per cent. of the actual amount of the debts, such being the effect of the alteration in the rate of exchange since 1807.

Thus, the British negociator, not contented with recognising the illegal Danish confiscations of British property, actually invited the Danish debtors to get rid of their outstanding debts, by making the above trifling payment for their discharge before the treaty was ratified!

The most singular feature attending this mismanaged affair, is, that after the interest of the British merchants had been abandoned by their Government, the effect of Lord Ellenborough's decision was such, that the King of Sweden —which country as to the claims then stood in the place of Denmark—felt it necessary to give up the advantage ground conceded by the British negociator, from the impracticability of continuing mercantile dealings between the countries without paying the old debts. The Swedish government 'resolved to repay to the Danish debtors the amount paid into the States Treasury, provided they on their parts will engage to settle with their British creditors.'

Although this convenient act of justice by Sweden, was done with a bad grace, yet it was better than no justice. But what can be thought of our own Government, after its professions of insisting on compensation before concluding peace, actually throwing overboard the interest of its subjects, and leaving to the Swedish government to do half justice to them, from the impracticability without doing so of securing the advantages of subsequent dealings between the countries?

There cannot, we conceive, be a shadow of doubt in the breast of any person with a sense of right and wrong, that not to compensate the claimants for '*book debts*' and '*goods on shore*,' so illegally confiscated, would be 'downright robbery,' as it has been stigmatized by Mr. Hume. That the Government of this country have evaded doing justice to these claimants from 1807 to the present time, instead of being any justification for the continuance of the injustice, should be viewed as an aggravation of it.

But let us now consider the claims for compensation of another class of British merchants, on a distinct ground from the preceding—that is, from the Danish property confiscated in this country, applicable for such compensation, being ten times the amount required. In this class we include all those whose losses arose from ships or goods *afloat*, seized and confiscated in Denmark. These goods we admit to have been properly dealt with after war was

declared between the countries; and therefore that it is necessary to establish peculiar circumstances, with reference to those losses, before the Government would be justified in appropriating the public property to make them good, if it should be found that the Admiralty droits, from being expended, are beyond the control of Parliament. The grounds on which we think that these claimants are equally entitled to compensation with those for 'book debts' and 'goods *on shore*,' are,

1st. That the attack on Copenhagen, to seize the Danish fleet, which led to the confiscation of British property, was of an unprecedented character.

2nd. That the English Government, by licensing vessels to take British goods to Denmark, after determining upon the expedition, became parties to a deception by which the vessels and goods were lost.

3rd. That from the hopes held out by Government of compensation to the claimants generally at the peace, without distinguishing between the different classes, 'expectations were in consequence excited.' This was admitted by the Chancellor of the Exchequer (Mr. Goulburn) in the House of Commons, on 4th July, 1828, on discussing the petition of Mr. Shillito, one of the claimants.

4th. That a part of the Danish property confiscated should have been converted into a fund with which to compensate these losses.

The manner in which these claims have been viewed by Government, and in the House of Commons, in the course of frequent discussions on their character, is curious, as showing the mutable nature of political justice!

In 1808, and subsequently, the before mentioned committee of the claimants had frequent communications with ministers. Innumerable petitions were presented by claimants to the House of Commons—the Treasury, the Privy Council, &c. The object of the answers appears to have been to delay a settlement with the claimants, on the pretence of its being necessary to wait for a treaty of peace with Denmark; yet this government made repeated assurances from time to time to the claimants, through their chairman Sir Charles Price, "that the distribution of a portion of the proceeds of the Danish property confiscated should be postponed on their behalf."

In 1814 peace came, but without any attendant blessings to the claimants; the Ministers of that year had got different ideas of justice from the Ministers of 1808; the lapse of six years had effected the change; and both the ministers of this country and of Denmark then agreed in one view of the subject, namely, that they would not give up any part of the property of the subjects of each other, which by confiscation had come to their hands, in order to compensate the losses of those subjects;—so that on the negociation for peace, it was agreed to between both governments that each should return the property *not actually confiscated*—very much after the manner of the negociations of thieves, for returning to those they have plundered goods *not actuallly melted!*

In 1817, a petition on the part of Mr. Shillito, one of the claimants, was presented to the House of Commons; when Lord Bexley, one of the ministers of that day, apparently at a loss what to say to gain further time—said—"he was not prepared to take the case into consideration *immediately*." This occurred ten years subsequently to the wrong committed! And if his lordship had added, that he hoped by the death, or ruin of all the climants, he would not be under the painful necessity of taking into consideration at all, the doing justice to British merchants, his speech would have been complete.

In 1823, Mr. Canning's ideas of justice came into operation; he thought "that the claim for compensation could only be recommended to the liberal consideration of the Swedish government, and under circumstances of great *delicacy* on the part of His Majesty's government."

In 1828, Sir James Mackintosh brought the claims before the House of Commons; and on that occasion we find the Chancellor of the Exchequer of the day (Mr. Goulburn) saying, "that in consequence of the claimants having been told by government, that they must wait for negociations for peace, he did not mean to deny, that expectations were in consequence excited."

In 1830, Mr. Goulburn probably conceiving that in his former admission he had been carried away by his feelings of commiseration for the British sufferers, "now denied that any pledge had been given to liquidate those claims; if done, it would open the door to innumerable other claims."

In 1834, Lord Althorp, the Chancellor of the Exchequer, said, in his place in the House of Commons, upon a motion by Mr. Parker for a committee to inquire into the claims, that the claim of the British sufferers was either against the Danish government, or against the droits of the Admiralty. In the treaty of Kiel no provision was made by this government to secure the rights of those parties; therefore these claims, if they existed at all,—existed then against the droits of the Admiralty. "It is perfectly true," he then proceeded, "by the capture of Copenhagen a large sum of money was realized by the crown as admiralty droits, and it does appear to me that, as it did not please this government to protect the rights of these individuals at the time of making the treaty of peace with Denmark, and as the crown by the same transaction which deprived these gentlemen of their property acquired considerable property in its own hands, the property so acquired ought to have been answerable for the loss sustained by British subjects by that transaction. But the question, since the accession of his present Majesty, has assumed in a great degree a different aspect. The droits of the crown have been expended in different ways since the period of 1814; and the claim now made by these gentlemen is not against the crown for droits which were the private property of the crown, but it is against the people of England who never received one farthing of their droits. I confess that looking at the case in this point of view—finding that the administration who concluded the treaty of peace at Kiel, and the different administrations who have succeeded it, did not feel it their duty to meet these claims, and considering that the money is no longer forthcoming to liquidate them, I do not feel justified in proposing to this house to tax the people of England for that purpose. The question has been very properly brought forward by the honorable gentleman (Mr. Parker) and it will be for the house to decide whether it will or not adopt his proposition. I feel it is a great hardship upon these claimants, but yet I do not think that, as a minister of the crown, I should do justice, under the circumstances I have stated, to grant this sum, and to charge the people of England with that for which they are not, in any respect, liable." *Mirror of Parliament of 16th May, 1834.*

Lord Viscount Morpeth, after adverting to the admission by the Chancellor of the Exchequer of the justice of the claims and to his wish to throw the case into other hands, went on to say, "That when my noble friend reflects that this is essentially a commercial country, he must feel, as a minister of England, that what is asked is an act of justice to be done, and not of favour to be shown, to those who, under the guarantee of our flag, embarked in commercial pursuits with foreign nations."

Other members of parliament having followed in a similar strain, their unanimity again called forward the Chancellor of the Exchequer, who, after adverting to that unanimity, said, *that measures should be taken to pay such claims as may be found to be just.* "I certainly felt," he added, "throughout the discussion, that it was impossible to resist the justice of those claims; at the same time I did not think I ought, individually and without the sanction of the house, take upon myself the responsibility of proposing their liquidation."

We cannot believe that Lord Althorp, after admitting the justice of the claims generally, could be serious in saying, that in consequence of the Admiralty droits being expended by the crown, the claimants could have no redress; for as his lordship made no distinction, this would be, in our opinion, a direct denial of justice, inasmuch as the claims for book debts and goods *ashore* constitute an undoubted valid claim against the public, from the oversight of a preceding government in not getting them compensated by Denmark. To oppose justice on the ground of its not having been done by preceding ministers, is a convenient way of perpetuating wrong when once committed; but this country is not yet in the condition that it cannot meet the "just claims" of its creditors. It can never be forgotten that upon Mr. Parker withdrawing his motion for a committtee on the claims, the Chancellor of the Exchequer gave this pledge, THAT MEASURES SHOULD BE TAKEN TO PAY SUCH CLAIMS AS SHOULD BE FOUND TO BE JUST. We concede the necessity of limiting the compensation to just claims, but after prolonged delay and the torturing hopes excited, [illegible] limitation would be both hardship and injustice.

priety of compensating just claims is admitted on all hands; do not let us reckon the cost; to do so would indeed justify the charge sometimes brought against us of being a nation of pedlars. Even Mr. Hume said, "If the Admiralty droits are expended, and there are no means thereby to grant compensation, we are bound to lay a tax for that purpose; for the claim was one founded in strict justice."*

CRIMINAL OFFENCES.

HITHERTO legislation for the prevention of crime has been but unsystematically pursued in this country; insulated efforts have been and are occasionally made to check any one particular evil, which at the time may have become prominent and offensive; but no enlightened views have been taken of the great whole. Punishments are inflicted, penalties enforced; but these have not been followed up by any inquiry as to whether they have been productive of the desired good, or whether they have been the best and wisest means for attaining this end; and until the present time no data have been furnished whereby the philanthropist could pursue such an investigation with the remotest hope of success. The Tables made up by order of government, of the number of criminal offenders in England and Wales in 1834, and lately laid before Parliament, exhibit a great and striking improvement on those given in former years; and their examination cannot fail to be interesting, as affording a somewhat clearer insight into this subject than we have hitherto had means of obtaining. Much still remains to be accomplished, but so important a step has in the present instance been made towards furnishing correct information on the statistics of crime in this country, that we may reasonably hope the desiderata still remaining may be supplied by degrees in future tables. In those which we are now about to examine, the several offences are more accurately distinguished and classified than in any statements heretofore prepared for presentation to parliament. The state of crime is shown with reference to each county. The age and sex of the persons charged are stated. The sentences passed in respect of each description of offences, and the execution of capital sentences or commuted punishments, are stated.

The classification of offenders might with advantage be made still more minute; and although we do not expect that it could be given with so much particularity and with so many subdivisions as are adopted in the annual reports made by the minister of justice in France, yet the trade and station in society of offenders might surely be readily ascertained by the keepers of the different prisons throughout the country. Above all, the importance of obtaining accurate information as to the degree of instruction of each individual committed to gaol, cannot be too strongly insisted upon; as from the knowledge of this fact the true value of education as a corrective of vice may be somewhat better ascertained than it now is, and important evidence may be obtained as to the degree and kind of instruction best calculated for fostering and confirming the moral principle.

Another very requisite particular is the distinguishing of those offenders who have been committed more than once, and the length of time which has elapsed between each offence of the same individual. At present there are no means of ascertaining how often the same offender is the perpetrator of different crimes, and therefore though these tables may accurately mark the amount of offences, they by no means exhibit the positive number of offenders, a great proportion of whom, it is well known, appear more than once as criminals at the bar of justice. A division pointing out this class of offenders is not only important as furnishing correct data whereby the real number of criminals may be determined, but it is of still more consequence in exhibiting the nature of prison discipline, and in showing whether the contagion of a gaol be indeed so noxious as there is too much reason to fear is the case. By a little arrangement it might also be readily shown which of our prisons are in this respect the best conducted, or which of em produces the most beneficial and lasting effects on moral character, and from which of them the enlarged it more quickly relapses into evil courses. We have pointed out what appear to us the leading omissions on th sible.

* From Discussions in Parliament on 4th July, 1828.

in these tables before entering into an analysis of their contents, not with any view of depreciating what has already been done, but with the hope that in future years the omissions we have noticed may be supplied. The following table shows the comparative state of crime in each county:—

Proportion of Offenders to the Population in each County of England and Wales; showing, also, the Centesimal Proportions of Male and Female Offenders in each County:

In the tables before us the offences are divided into two leading classes—crimes against the person, and crimes against property; this latter class is subdivided into four minor classes, and there is another division comprehending all offences not included in the other five classes. Thus there are altogether six divisions, in each of which the actual offence is respectively specified, exhibiting at one view the number of persons convicted and acquitted; the nature of the crimes committed, of the punishments inflicted, and the age and sex of each particular delinquent. According to these statements we find that the proportion

of offenders to the whole population of England and Wales is 1 in 619; if the number of relapsed criminals were given the ratio would be more favourable. The proportion of convicted offenders to the population is 1 in 868, and of those acquitted 1 in 2159. The following table contains an abstract of the number of offenders, distinguishing each class, the degree of punishment awarded, and various other interesting particulars.

Abstract of the Total Number of Persons charged with Offences in England and Wales, in the Year 1834, distinguished in Classes according to the Nature of the Offences, together with the result of the Accusations, and the Centesimal Proportion in each Class.

OFFENCES.	Total number of offenders.	Convicted.																Acquitted and discharged.			Insane.		Execution or commutation of capital sentences.										Centesimal proportion of offenders of each class.
		Death.	Transportation.			Imprisonment with, in some cases, whipping, &c.					Whipping.	Fine.	Discharge on sureties.	Sentence respited and pardon.	Total.	Found so on examination.	Not guilty on trial.	No bill found.	No prosecution.	Total.	Acquitted as being so.	Found so on examination.	Execution.	Commutation.									
			Life.	Fourteen years.	Seven years.	Other periods.	Above three years	Three years and above two years.	Two years and above one year.	One year and above six months.	Six months and under.													Transported for life.	Transported for fourteen years.	Transported for seven years.	Imprisoned for two years and above one year.	Imprisoned one year and above six months.	Imprisoned six months and under.				
No. 1.—Offences against the person	2,455	95	8	1	14	1	..	..	133	764	..	222	96	1	1,443	1	784	173	47	1,004	7	1	24	48	4	5	2	11	1	10.94

No. 6.—Other offences not included in the above classes	1,336	12	2	15	93	..	..	..	112	430	59	158	146	2	931	..	271	67	77	415	..	5	5	34	43	30	1	39	11	..	5.36
Total	22,454	480	864	688	2,501	7	1	5	1,589	8,895	59	413	255	7	15,995	8	4,347	1,695	393	6,435	13	8	312	34	43	30	11	39	11	..	100.00

An examination of this table forcibly presents to the mind the faulty state of our criminal laws, and in how inconsistent and arbitrary a manner capital sentences are awarded and commuted. The following positions are now generally conceded as axioms—that punishment to be efficacious should be certain; that as far as it is possible a definite punishment should await every particular offence; and that no temptation should be given for the commission of crime by the severity of a sentence which it is known will therefore be commuted, and which very often deters the injured party from prosecuting. It will be seen that out of 480 offenders to whom the sentence of death was awarded in 1834 only 34 were executed, or 7.083 in every hundred; what punishment was really inflicted on the remaining large proportion was never stated in the tables of any of the preceding years; but in these before us we have it distinctly shown, and find that out of the whole number, 446, on whom the sentence of death was commuted, one received a free pardon; 13.453 in every hundred were sentenced to imprisonment for various periods from two years to six months and under; and 86.323 in every hundred were sentenced to transportation, the greater proportion for life. In No. 2 the proportion between the sentence of death and execution is still more remarkable, being only .588 in every hundred, or 1 in 170. Sentence of death is not actually passed on these criminals and a respite granted afterwards, but it is recorded against them, whereby they are subject to certain civil disqualifications, and this recording is therefore in itself a punishment superadded to the commutation of the capital offence: some persons defend this inconsistency and uncertainty of the law, and make a great distinction between sentence passed and sentence only recorded; but surely no reason can be offered for leaving so great a discretionary power in the hands of the ministers of justice. Of the twelve offenders in class No. 6 to whom sentence of death was awarded, five were found guilty of being at large under sentence of transportation, and seven were found guilty of assembling armed, &c. to aid smugglers. The *real* sentence passed on these latter was imprisonment; one offender for one year and above six months, the remainder for six months and under! What argument can be advanced in favour of this preposterous discrepancy between the penalty awarded by the law and that inflicted in practice?

It will be seen from an inspection of the foregoing table that of the number accused a large proportion were acquitted; about 100 in 349, or between one-fourth and one-third of the whole, being found not guilty. In No. 4 the number of those acquitted is greater than that of the convicted offenders; with this exception, the proportion of acquittals to convictions is greatest in offences committed against the person: many of these cases are assaults committed with extenuating circumstances, and charges of manslaughter are often found by the verdict of the jury to be justifiable homicide; out of 228 persons accused of manslaughter more than one half, or 119, were acquitted. The following are the proportions of the convictions to the acquittals:—

No. 1—10	6.96
2—10	4.21
3—10	3.63
4—10	14.545
5—10	1.61
6—10	4.5

In the following table the centesimal proportion of each age to the whole population above ten years is calculated from the population-tables of 1821, and on the assumption that there are no criminals under the age of ten years. We learn from this table that the amount of crime in the male population is very far beyond that among the females;—of every 100 offenders 84 are males, and at every age, and with regard to every description of crime, this great disproportion is found to exist. It is lamentable to find that the amount of crime is so great between the ages of 12 and 21,—that youth is so early initiated into the practice of vice and trained up to theft. The greatest number of offenders at the respective periods of age are from 16 to 21; but it will be seen by inspection that the offences are chiefly offences against property committed without violence; it is mostly in after years that these juvenile depredators become hardened in crime.

TABLE, shewing the Ages of Persons accused of Criminal Offences in England and Wales, in 1834, distinguishing the different Classes of Offences, and Males from Females; the proportion of Offenders at each Age compared with the Total Numbers of the Population of the same Ages, the Centesimal Proportion of Offenders of each Age and Sex compared with the Total Number of Persons of each Sex above Ten Years of Age, and the Centesimal Proportion of Offenders at the different Periods of Life.

AGES.	Numbers at different ages of the Population of England and Wales.			Offences against the person.		Offences against property committed with violence.		Offences against property committed without violence.		Malicious offences against property.		Forgery and offences against the currency.		Other offences not included in the preceding classes.		Total number of offenders.		Proportion of offenders to population of respective ages.		Centesimal proportion of each sex above 10 years of age.		Centesimal proportion of offenders at different periods of life.

Does not this fact offer a strong argument in favour of education? If, at their tenderest years, the unhappy children of poverty were not left to the contamination of evil example and precept, so many could not become at early an age such reprobates as now fill our prisons, so greatly swell our list of criminals, and become still further educated in vice. From 21 to 30 years of age the proportion of the whole number of offences is not so great as in the preceding period, but that part of the criminals committed for offences against the person is in much greater proportion to the rest. Between 16 and 30 there is by far the greatest amount of crime; much more than half of the number of offenders of every age is included in these periods, while less than one-third of the whole population is comprised between these ages.

Hitherto, from the imperfect and incomplete data furnished by our English tables, we have not been able to compare, with any degree of accuracy, the state of crime existing in England and France; and even now, with our increased information, it is difficult to obtain more than an approximation to the truth, in consequence of the respective classifications of crime being different in the two countries, while the estimate made in each country as to the turpitude of various crimes is by no means the same.

Table, showing the absolute proportion in which crimes of different degrees were committed in France and England, calculated with reference to the population of each country. The proportion of their respective populations is as 7.03 to 3.

OFFENCES.	France. Proportion to absolute Population.		England. Proportion to absolute Population.		Proportion of number of Offences committed in France and England.		Proportion of number of Convictions in France and England.	
	Accused.	Convicted.	Accused.	Convicted.

Offences against Property, &c	1 in 1302	1 in 1766	1 in 694	1 in 955	5	4	1.259	1

N.B. The latest table yet published, exhibiting the state of crime in France, applies to the year 1832: it is this from which the above comparison has been made. The English tables are those of 1834, previously to which time, as already stated, the mode of framing the returns in this country did not admit of the comparison being made with any approach to accuracy.

In France, many offences of a minor quality, against which criminal proceedings are taken in this country, are tried before the "correctional tribunals," and are noticed among petty delinquencies. Thus there are 13,324 offences classed under "*coups et blessures volontaires*," dealt with by the "correctional tribunals," and which, in the English tables, would be placed under the head of assaults. Cases of

larceny, swindling, uttering base coin, &c., are likewise tried before these "correctional tribunals." We have endeavoured, as far as possible, to extract the several offences correctly from the tables, and to class them under heads answering to the same in the English tables, in order to institute a fair comparison. It was our intention to have entered more fully into the subject than our present limits will allow, but we can only find space for briefly drawing the comparison in a tabular form, which is given in the preceding page, by which means the reader will be enabled, at one view, to judge of the state of the two countries in regard to crime.

PARLIAMENTARY ABSTRACTS.

National Debt.—An account of the saving accrued to the public by the conversion of stock from a higher to a lower rate of interest:—

	Capital.	Interest on the Capital. At the highest rate of Interest.	Interest on the Capital. At the lowest rate of Interest.	Saving.

TRADE, STATISTICS, &c.

The Falkland Islands.—It is understood that an application has lately been made to Government by some persons who wish to establish a company with the view of colonizing these islands. The following notice, for which we are indebted to a correspondent, may therefore be interesting at the present moment:—

The Falkland Islands, named by the Spaniards "Malvinas," form a group of nearly ninety in number, two of which are very large. They are situated in the Southern Ocean, distant about 480 miles east of the coast of South America, and about 300 north-east of Cape Horn, lying between the latitude of 51° and 52½° south, and between 57° and 61½° west longitude.

West Falkland, the largest of the two islands, is at present entirely uninhabited. It is about a hundred miles in length, and fifty in breadth, surrounded on all sides by excellent harbours, of which Port Egmont on the north is the most frequented, being very capacious and well sheltered by several islands lying at its entrance. It was at Port Egmont that the English founded their first settlement in the year 1774. There are no cattle in the island, although the pasturage is excellent.

East Falkland, named Soledad, by the Spaniards, is separated from West Falkland by an extensive sound, containing numerous islands and rocks. This island is about seventy-eight miles in length, and forty-seven at its greatest breadth, but narrows to twenty-five or thirty miles in the southern parts.

Berkeley Sound is situated at the north-east point, and is six or seven miles wide at the entrance. It runs up nearly twelve miles, as far as Port Louis, where the British settlement is at present placed. There is plenty of depth of water for vessels of any size in Berkeley Sound, with good shelter and anchorage, as well as every convenience for heaving vessels down and repairing them.

The village of Port Louis is situated in lat. 51° 32′ south, and 58° 19′ west long., on the banks of a small creek, with about six or eight feet water. There were about eighteen persons in all settled on the island, most of whom are from Buenos Ayres, when Lieutenant Smith, with about ten or twelve seamen and marines, took possession of the island in the name of the British Government. A vessel of war is now generally stationed there as a further protection.

The country about East Falkland is of moderate elevation, but the western island is more hilly. The surface of the soil is of a peat nature, but capable of great improvement, and it can be easily manured as the coast abounds with sea-weed. The pasture even to the summit of the hills is very good in its natural state, and peculiarly well adapted for feeding sheep. There are no trees, and consequently no wood of any sort for fuel, but there is abundance of peat, which makes an excellent substitute. The absence of trees has this advantage, that it relieves the cultivator from the labour and expense of clearing the land. Water is everywhere abundant, and remarkably pure and good, rivulets intersecting the land in every direction. There is plenty of stone, which might easily be quarried, with abundance of clay for making bricks.

The climate of the Falkland Islands is temperate, and considered perfectly healthy, not being subject to extremes either of heat or cold; there is very little frost or snow in winter, the latter seldom lying on the ground twenty-four hours together, excepting upon the summit of the hills; and the harbours are never frozen. The quantity of rain that falls here is not greater than the average of temperate climates. The thermometer in winter generally averages 40° of Fahrenheit and is seldom so low as 32°. In summer it ranges from 60° to 70°, but never rises above 75°.

The prevailing winds are south-west and north-west; the weather is generally clear with the former, and foggy with the latter. During the winter season the winds at south and east blow occasionally with great violence. The summer months are from December to February, and the winter from June to August.

The principal production of East Falkland may be said to be cattle, of which there are supposed to be upwards of 5000 head, all wild; the beef, although small, is very tender. The cows give excellent milk; the wild cattle are caught by the Guachos or Buenos Ayres Indians, with their lassos, who drive them to a place about nine miles from Port Louis, where they slaughter them when required. There are about five hundred horses on the island, also wild, and of a small breed. Rabbits are extremely numerous, and of a large size; pigs are likewise plentiful in a wild state. There is a great variety of sea-fowl, particularly solan geese, wild ducks, teal, and snipes, most of which are good eating.

The creeks and waters abound with fish of various descriptions; the finest is a species of large mullet, which is salted down and sold to the shipping.

These islands also abound with seals and sea elephants. The skins of the former are very valuable, and the procuring of them forms the chief inducement for vessels to resort to the islands.

Of natural productions the sea-weed for making kelp is so abundant that vast quantities could be collected if a market offered for its sale.

Potatoes, turnips, carrots, cabbages, and all common sorts of vegetables grow excellently; and there is no doubt but currants, gooseberries, and other fruits would thrive equally well.

The hardy species of Scotch firs and larch would also probably succeed as timber trees.

LIST OF BILLS BROUGHT IN.

HOUSE OF LORDS.

June 1. A bill for establishing the legitimacy of children born of marriage within prohibited degrees in certain cases.—*Lord Lyndhurst.*

3. A bill to amend the law touching patents for inventions.—*Lord Brougham.*

11. A bill prohibiting subscription to the Thirty-nine Articles in certain cases.—*Lord Radnor.*

HOUSE OF COMMONS.

June 1. Loan Societies Bill—"to encourage the establishment of loan societies in England and Wales."—*Mr. W. H. Ord.*

2. Stafford Disfranchisement Bill—"to exclude the borough of Stafford in the county of Stafford, from sending burgesses to serve in Parliament."—*Mr. Divett.*

4. Bribery at Elections Bill—"more effectually to prevent bribery and corruption and unnecessary charge and expense in the election of members to serve in Parliament."—*Mr. Hardy.*

— Civil Bill Courts (Ireland) Bill—"to extend the jurisdiction of the civil bill courts, and to facilitate the proving of wills and obtaining letters of administration in certain cases, and to fix the salaries of assistant barristers in Ireland."—*Mr. Lynch.*

5. Municipal Corporations Bill—"to provide for the regulation of Municipal corporations in England and Wales."—*Lord John Russell.*

— Instruments of Sasine (Scotland) Bill—"to amend certain acts of the Parliament of Scotland, respecting the registration of instruments of sasine, and other writings affecting heritable property within that part of the United Kingdom."—*Lord Advocate.*

— Savings' Banks (Scotland) Bill—"to extend to Scotland certain provisions of an act of the ninth year of his late Majesty, to consolidate and amend the laws relating to savings' banks, and to consolidate and amend the laws relating to savings' banks in Scotland."

— Offences against the Person Bill—"for amending the law relating to offences against the person in certain cases."—*Mr. Jervis.*

— Western Australian Settlements Bill—"to continue an act of the tenth year of his late Majesty's reign, for the government of his Majesty's settlements in Western Australia, on the western coast of New Holland."—*Sir George Grey.*

— Court of Session (Scotland) Bill—"to improve the present system of the Court of Session in Scotland, and regulate the number, powers, and duties of the judges, clerks, and officers of the said court, and of the Courts of Teinds and Justiciary; also, the number and duties of the clerks and other officers in the said courts, and pay them fixed salaries, and to abolish the fee fund, and other court dues levied from suitors."—*Mr. Wallace.*

— Postage Bill—"to extend the accommodation by the post to and from foreign parts, and for other purposes relating to the Post-office."—*Mr. Labouchere.*

— Sheriff Courts (Scotland) Bill—"to explain and regulate the jurisdiction of the Sheriff Courts of Scotland, and to transfer the benefits of jury trial in civil causes to a limited amount to the said courts; also, to regulate the duties and appointment of sheriffs, principal and substitute, and the appointment of procurators fiscal."

— Dominica Indemnity Bill—"to allow, for a limited period, the importation of certain articles, duty free, into the island of Dominica, and to indemnify the governor and others for having permitted the importation of such articles duty free."—*Mr. Baring.*

11. Education (Ireland) Bill—"for the establishment of a board of national education, and the advancement of elementary education in Ireland."—*Mr. Wyse.*

17. Civil Affairs (Ireland) Bill—"for the administration of certain civil affairs of a local nature in Ireland."—*Sir Richard Musgrave.*

19. Expenses at Elections Bill—"to regulate the expenses of elections of members to serve in Parliament for England and Wales."

— Trade in Corn (Isle of Man) Bill—"to regulate the importation of corn into the Isle of Man."—*Mr. P. Thompson.*

— Weights and Measures Bill—"to repeal an act of the fourth and fifth year of his present Majesty, relating to weights and measures, and to make other provisions instead thereof."—*Lord Viscount Ebrington.*

— Marriage Act Amendment Bill.

22. Linen Trade (Ireland) Bill—"to continue and amend certain regulations for the linen and hempen manufactures in Ireland."

— Aberdeen Universities Bill—"for uniting King's College and University of Old Aberdeen, and Marischal College and University of Aberdeen, into one university and college."—*Mr. Bannerman.*

LIST OF COMMITTEES.

HOUSE OF COMMONS.

June 1. Committee "to take into consideration the duties on timber, and to report their observations thereupon to the House."

2. Committee to inquire into the nature, cause, and extent of those lamentable catastrophes which have occurred in the mines of Great Britain, with the view of ascertaining and suggesting the means for preventing the recurrence of similar fatal accidents."

— Committee "to inquire into the practicability and public advantage of making a navigable inland communication between Galway and Castlebar, through Lake Rakios; and between Ballina and Castlebar, through the Lakes Conn and Cullin."

11. Committee "to examine and consider the evidence in the several reports presented to this House from the commissioners appointed to inquire concerning charities in England and Wales, and also the measures which may be most effectually adopted to complete at an early period the inquiry relative to uninvestigated charities, and report their opinion by what mode the charity funds may be most efficiently, promptly, and economically administered."

22. Committee "to examine into the state, funds, and management of the diocesan, royal, and other schools of public foundation in Ireland, as also into the system of education pursued therein, with a view to increasing their utility, and to inquire how far it may be practicable and expedient, and in what manner, and from what sources, to improve, extend, and permanently maintain academical education in that country."

POLITICAL RETROSPECT FOR JUNE, 1835.

GREAT BRITAIN.

OUR last monthly retrospect carried down the account of parliamentary proceedings to the close of the week ending on the 23d of May.

Both Houses re-assembled on Monday the 25th. In the Lords Lord Melbourne, in answer to some observations of the Duke of Richmond on the report of the select committee on Prison Discipline, of which his grace had been chairman, stated that the Government would in the course of the session bring in a bill in accordance with the resolutions of the committee. Another discussion afterwards arose on the subject already so frequently debated of the procession which attended Lord Mulgrave on his late entry into Dublin. The dispute about the flags was this time commenced by Lord Roden, who wished the Government to produce the Lord Lieutenant's own despatch. This Lord Melbourne declined to do, but stated that if a distinct motion were made for the production of the despatch he should be prepared to meet it.

In the House of Commons the business of the evening commenced with an interesting discussion on the case of Mr. Child of Bungay, who had been committed to Ipswich Gaol on a sentence of the Diocesan Court of Norwich, in the course of proceedings taken against him by the church-wardens of Bungay, for the recovery of certain church-rates which he had refused to pay. The subject was brought before the House by various petitions presented by Sir William Folkes and other members. Lord John Russell expressed his belief that the churchwardens had not intended to expose Mr. Childs to any peculiar hardship; but it seemed to be the general opinion of the House that the mode of proceeding which had been adopted by these functionaries was illegal. It is understood that Mr. Childs has since commenced an action for damages against them.

In the latter part of the evening the Marquis of Chandos, on the question being put that the House should resolve itself into a Committee of Supply, rose to make the motion of which he had given notice, on the subject of agricultural distress. His lordship moved that an humble address should be presented to his Majesty, expressing the anxious desire of the House that the attention of the Government might be directed without further delay to this subject, with a view to the removal of some portion of those burdens to which the land is subject, through the pressure of general and local taxation. In the course of his speech he recommended, besides the reduction of the county rate, and the commutation of tithes, the abolition of the taxes on spring-carts, and on windows in farm-houses, and the enactment of protecting duties on foreign butter, cheese, and seeds. To this motion, which was seconded by Lord Darlington, Lord John Russell moved as an amendment,—"That this House will direct its early attention to the recommendations of the committee which sat during the late session of Parliament on the subject of county rates, with a view to the utmost practical alleviation of those burdens to which the land is subject, through the pressure of local taxation." After a debate in which Mr. Cobbett, Mr. Clay, Sir Robert Peel, Mr. Spring Rice, and Mr. O'Connell, took part, this amendment was carried by a majority of 211 against 150.

In the House of Lords on Tuesday the 26th a debate took place on a petition presented by Lord Duncannon from Mr. Craig, one of the commissioners of public education in Ireland, begging the House to call upon the Bishop of Exeter to bring forward without further delay certain charges against the petitioner which his lordship had some time before announced his intention of making on the authority of a Reverend Mr. Stoney, the incumbent of a parish in the county of Mayo. The Bishop of Exeter persisted in declining to bring forward the charges till the report of the commissioners should be laid on the table of the House.

In the Commons this evening, on the order of the day being read for the further consideration of the report on the Great Western Railway Bill, Mr. Miles moved the insertion of a clause to prevent travelling on the rail-road on Sunday. After a debate of some length, however, this proposal was, amid the loud cheering of the House, rejected by the decisive majority of 212 to 34. The House was afterwards counted out in the course of a speech by Mr. Robinson, introductory to a motion relative to the right of British subjects to a concurrent fishing on that part of the coast of Newfoundland called the French shore.

On Wednesday the 27th no business of importance was transacted in either House, although several petitions were presented which gave rise to some discussion. At their rising, both Houses adjourned to the 1st of June.

On that day in the House of Lords, Lord Lyndhurst brought in a bill, which was read a first time, for altering the law with regard to the dissolubility of marriages within the prohibited degrees. We have noticed this measure elsewhere.

In the House of Commons, after a short conversation on the recent interference of the military at Wolverhampton (see the Chronicle of Occurrences), in the course of which Lord John Russell intimated that a person should be sent down by the Government (as has since been done) to make an inquiry into the circumstances on the spot, Mr. Cayley brought forward his motion for a "Select Committee (based on the parliamentary declaration of agri-

cultural distress) to inquire if there be not effectual means within the reach of Parliament, to afford substantial relief to the agriculture of the United Kingdom, and especially to recommend to the attention of such committee the subject of a silver or conjoined standard of silver and gold." After a debate of some length this attempt to prevail upon the House to tamper with the currency, was defeated by a majority of 216 to 126.

On Tuesday the 2nd, in the House of Lords, in the course of another conversation about the Dublin procession, and a correspondence which had taken place on the subject between the Duke of Cumberland and the Marquis Wellesley, Lord Melbourne took an opportunity of emphatically repelling the charges which had been brought against the Government as having been guided in making the late legal appointments in Ireland by the direction and influence of Mr. O'Connell.—The Islington Market Bill was then read a second time by a majority of 30 to 1.

In the Commons one of the most interesting discussions of the session took place on the motion of Mr. Grote for the introduction of the vote by secret ballot, in the election of members of Parliament. In introducing this motion the honourable member addressed the House at great length. The motion was seconded by Sir William Molesworth. Mr. Gisborne, then, on the ground that he did not think secret voting was attainable, although he seemed to admit that it would be desirable if it could be attained, moved the previous question. The honourable member however afterwards withdrew this motion, and Lord John Russell having met Mr. Grote's motion with a direct negative, the House divided at two o'clock in the morning, when the numbers were found to be, 144 for the original motion, and 317 against it.

On Wednesday the 3rd, in the House of Lords, Lord Brougham brought in a bill to remedy some of the defects of the existing patent laws, which was read a first time, and ordered to be printed.

In the House of Commons this evening, after a good deal of time had been occupied in the adjustment of a misunderstanding between Mr Hume and Mr. Lechmere Charlton, member for Ludlow, arising out of some expressions which had been used in the debate of the previous evening, Mr. Poulter moved that the report of the committee on the Sabbath Observance Bill should be taken into further consideration. Mr. Ward, however, having moved that the report should be considered that day six months, this amendment (which gets rid of the measure) was after a short discussion carried by a majority of 54 to 43. Several other bills were then advanced a stage; among others the Wills Execution Bill was read a third time and passed, and the Roman Catholic Marriages Bill, the Inns, Ale-houses, and Victualling Houses Bill, the Hull Merchant Seamen's Bill, and the Limitation of Polls Bill, were all read a second time.—Mr. Ewart afterwards moved the second reading of the Prisoners' Counsel Bill, but withdrew the motion on the adjournment of the House being moved.

On the following evening the House was counted out while Mr. Bish was moving an address to the Crown that Parliaments might be occasionally held in Ireland.

On Friday, the 5th, the Metropolis Pure Soft-water Company Bill was thrown out on the second reading by a majority of 134 to 60. Lord John Russell then rose to ask leave of the House to bring forward a Bill, on the part of the Government, to provide for the regulation of Municipal Corporations in England and Wales. We have explained the principal provisions of this great measure in a preceding part of our present Number. The Bill, after a short debate, in which Sir Robert Peel and Mr. O'Connell took part, was brought in, read a first time, and ordered to be printed without opposition. It was agreed that the second reading should take place on Monday, the 15th. Both Houses, on their rising this night, adjourned to Wednesday, the 10th.

On that day, in the Lords, the second reading of the Great Western Railway Bill was carried, after a short debate, by a majority of 46 to 34.

In the Commons a long and interesting discussion took place on the Report of the Ipswich Election Committee, which was brought up by the Chairman, Mr. P. Stewart, and which declared that the sitting Members, Mr. Dundas and Mr. Kelly, had not been duly elected; that the petition against their return was not frivolous or vexatious: that the opposition to the petition was frivolous and vexatious; that the sitting Members were, by their agents and friends, guilty of bribery and corruption at the election; that certain other individuals were guilty of bribery; that others were guilty of absconding to avoid being served with the Speaker's warrants; that certain avowed agents of the sitting Members, and one of the counsel employed by them, had aided and abetted these persons in keeping out of the way; that one of the witnesses had been prevented from attending the Committee by being arrested on a charge of embezzlement under very suspicious circumstances; and that the conduct of the magistrates before whom he was so charged appeared to be a breach of the privileges of the House. The debate, which was commenced by Mr. Gisborne moving that six of the persons who had been declared guilty of bribery, should be taken into the custody of the Serjeant-at-Arms, was at last adjourned till the following day. The County Coroners' Bill and the Prisoners' Counsel Bill were then each read a second time, and the Capital Punishments Bill went through committee. The Lord-Advocate afterwards obtained leave to bring in a Bill to explain and amend the Scotch Reform Act, so as to prevent the creation of fictitious votes by the division of property, to diminish the expenses of election, and to take the poll at all contested elections in one day.

In the House of Lords, on Thursday, the 11th, the Newcastle and Selby Railway Bill was read a third time, and passed, after the rejection of a clause proposed by the Bishop of Hereford, to prevent travelling on the railway on the Sunday, by a majority of 40 to 19.

In the Commons, the debate on Mr. Gisborne's motion, with regard to the parties alleged to have been guilty of bribery at the Ipswich election, was renewed, when the motion, after being somewhat modified, was unanimously agreed to by the House. It was agreed to leave out the names of the two magistrates, and to refrain from any proceedings against them till the evidence taken by the Committee should be printed.

Mr. Harvey then rose to move for the appointment of a Select Committee to inquire into the state of the public charities of England and Wales, with a view to render them more efficient for the education of the people and the comfort of the poor. The Honourable Member explained his views on this important subject at considerable length, and no opposition was made to the motion. After this, Sir S. Whalley moved a resolution to the effect that the tax on windows was injurious to the health and comfort of the people, and ought to be repealed, which, after an attempt had been made by the mover to withdraw it, was negatived, on a division, by a majority of 204 to 16.

Sir William Rae then moved that the petitions presented to the House relative to the building and endowing of places of worship connected with the Established Church of Scotland, be referred to a Select Committee. The motion was opposed by the Lord-Advocate, who moved as an amendment, that an address should be presented to his Majesty, praying him to appoint a commission to inquire into the opportunity of religious worship afforded to the people of Scotland, and especially to the poorer classes of the community, whether they belong to the Established Church, or be of any other religious persuasion. The debate was eventually adjourned till the following Monday, when the amendment of the Lord-Advocate was agreed to.

On Friday, the 12th, in the Lords, a short debate arose on the Government policy with respect to Canada, on a motion by Lord Aberdeen for an address to his Majesty, praying that a copy of the commission appointing the Earl of Gosford Commander-in-Chief and Governor-General of Upper Canada, Nova Scotia, and New Brunswick, should be laid before the House. The motion was agreed to.

This day, in the Commons, John Bury Dasent, one of the persons charged by the Ipswich Election Committee with absconding, having presented a petition to the House, it was moved by Mr. Stewart that he should be immediately called to the bar, and discharged from custody, after having been reprimanded by the Speaker. The motion, however, was negatived, and it was ordered that the petitioner should be brought up on the following Monday. A motion by Mr. Robinson, for the appointment of a Select Committee to investigate the general taxation of the country was then negatived, after a short debate, by a majority of 105 to 42. The House then went into a Committee of Supply, when various sums of money were voted on the Miscellaneous Estimates: among others, a sum of 7,665*l.* to defray the expense of fitting-up the interior of Whitehall as a chapel

(by a majority of 116 to 24); and a sum of 44,000*l.* for the building and furnishing of the two temporary Houses of Parliament. It was explained that 30,000*l.* of this sum was for the buildings, and the remainder for the furniture.

On Monday, the 15th, in the Lords, Lord Lyndhurst's Marriages Legalizing Bill went through the Committee An address to his Majesty was then agreed to, on the motion of Lord Rosslyn, for the appointment of five Commissioners to examine and report to the two Houses of Parliament upon the different plans proffered by the competitors for the erection of the new Houses.

In the House of Commons this evening, all the eight persons in the custody of the Sergeant-at-Arms on charges connected with the Ipswich election, were, on the motion of Mr. Gisborne, committed to Newgate. The Corporation Reform Bill was then, on the motion of Lord John Russell read a second time, after a short discussion, and ordered to be committed on Monday, the 22nd. An address to his Majesty was afterwards agreed to, on the motion of Lord Granville Somerset, praying him to carry into effect the resolutions of the committee on rebuilding the Houses of Parliament.

In the House of Lords, on Tuesday, the 16th, the Marriages Legalizing Bill was reported. In the Commons there was not a sufficient attendance to make a House.

On Wednesday, the 17th, in the Commons, various Bills were advanced a stage; among others, the Prisoners' Counsel Bill went through the Committee, after a clause proposed by Mr. Sandford, providing that in cases of felony, unless the counsel for the prosecution should have made a speech, the counsel for the prisoner should not address the jury in defence, had been negatived by a majority of 30 to 26.

On Thursday the 18th, various petitions were presented in both Houses, but no business of importance was transacted in either. The House of Commons was counted out soon after seven o'clock, while Mr. Andrew Johnston was speaking in support of a motion which he proposed to bring forward for abolishing lay patronage in the Church of Scotland.

On Friday, the 19th, the Report of the Commissioners on Education in Ireland was presented in the House of Lords by Lord Duncannon, and in the Commons by Lord John Russell. In the Commons, on the question that the House should resolve itself into a Committee of Supply, Mr. Thomas S. Duncombe moved for a copy of the instructions given to Lord Elliott and Colonel Gurwood upon their late mission to Spain, and severely reprobated the conduct of the late Government in that affair. The reply of Lord Mahon, however, in vindication of the mission, appeared to be satisfactory to the House in general, and Mr. Duncombe eventually withdrew his motion. A motion made by Mr. Buxton for a committee to inquire how far the provisions of the Bill for the Abolition of Slavery in the West Indies had proved efficacious, and whether, upon ascertaining their partial or total failure, it might not be advisable that the payment of the twenty millions of compensation to the planters should be arrested, was also, after an explanation by Sir G. Grey, withdrawn. The House then went into a Committee of Ways and Means, when the continuance of the sugar-duties for another year was moved by the Chancellor of the Exchequer, and agreed to.

FRANCE.

So far from the trial of the political prisoners being brought to a conclusion, it seems to promise, more than ever, to be interminable, and Messieurs the members of the Chamber of Deputies, and Messieurs the journalists and reporters, have been scratching and boxing one another about it, and the privileges of the newspaper press. We can scarcely relate these events in a serious humour, though the reflections to which they must give rise are certainly serious enough. In the course of a stormy debate, in which the galleries of the Chamber took part, General Bugeaud and some others of the ministerial party denounced the intemperance and sedition of the mass of the Parisian newspapers as evils that called for forcible correction. On this the stamping, roaring, and menacing gesticulation in the galleries increased ten fold. M. Jaubert, a deputy, declared that this disgraceful riot came chiefly from the gallery set apart for the reporters, and moved that it should be cleared. The gallery accordingly was cleared, the word of command being, "*Huissiers, faites evacuer la tribune des Journalistes!*" The reporters waited without, to *demand* an explanation from the house; and on the appearance of those who had voted their temporary expulsion, a scuffle and fight ensued, which was only put an end to by the interference of the National Guards on duty. The newspaper men say they were struck first, and that the fight was so unfair, that there were five doctrinaires, at least, against one journalist. On the following day, one of the ultra-liberal papers, the *Reformateur*, announced to M. Jaubert and his friends, that as they have begun the system of physical attack and of brute force against both right and reason, the doctrinaires may find that the journalists are as strong as they are, and they accordingly invite "the patriots" to inscribe their names at the bureau of the *Reformateur*, as willing to fight duels with M. Jaubert, and with all his friends.

In consequence of these not very gentle demonstrations, the learned editors of the *Reformateur* were ordered to attend at the bar of the Chamber, where the paper was made to pay dearly for its bravado, its registered or responsible proprietor being condemned in the maximum fine of 10,000 francs.

It would be a mere waste of time to go into the tedious details of all these proceedings and political trials: and so we shall leave the *procès monstre* until it draws towards a conclusion, or, at least, until something important or interesting arises out of it. We may mention, however, that those of the accused of April, 1834, who have consented to defend themselves before the Court of Peers, have received a declaration on the part of their co-accused who will not so consent, that they are considered as renegades from the republican cause they espoused, and are henceforth banished from the republican societies.

On the 10th of June the Chamber of Deputies went into the question of ways and means for the year 1836. In the course of the debate, M. d'Harcourt and General Demarçay proposed an amendment for immediately and considerably reducing the duty on foreign iron. This judicious amendment was, however, rejected by a small majority.

A few days after, the Chamber of Peers sanctioned the American Indemnity Bill by a majority of 122 to 25, stipulating, at the same time, for the honour of France, that the money is not to be paid until General President Jackson, explains away his threats, and makes a proper apology. It remains to be seen *how much* apology the old republican will make, or *how little* the French will be satisfied with.

Though evidently called upon by the Queen of Spain for an armed intervention, it appears that France, like England, is not disposed to enter into the war for the present. There is a talk, however, of Louis Philippe's withdrawing his "Foreign Legion" from Algiers, and *permitting it* to volunteer in Spain. We could have wished her young Majesty better auxiliaries, as the said legionaries have enjoyed but a very indifferent reputation in Africa. A considerable French squadron has sailed from Toulon to join the English in the waters of Athens, or the Piræus, and to do honour on the 24th of June, to the coronation of the young King Otho.

SPAIN.

The affairs of the Queen and the Constitutionalists have continued on the decline.

On the 16th of May, while the Procuradores were engaged in a debate on the national debt, intelligence reached Madrid of some insurrectionary movements at Cadiz, to suppress which General Riojas was immediately despatched.

In the north the Carlists have considerably enlarged the field of their operations, and had the best of several paltry skirmishes. They obliged the Christinos to withdraw from the Amescous, whither they had penetrated, and caused them a loss of three hundred men.

General Valdez, unable to do more than Mina, or Rodil, or the rest of his predecessors in the command of the army of the north, has entirely changed the plan of his campaign, and instead of advancing, has withdrawn, and taken up a position on the banks of the Ebro, which is to serve as the pivot of his future operations. For several weeks there has been a talk of removing Valdez from the command, and substituting the Count de Espeleta or the Marquis de las Amarillas. This would be the sixth change of Generals!

With the exception of Pampeluna, St. Sebastian, Bilboa, and Vittoria, the Constitutional army has abandoned all Biscay and Navarre to the Pretender. The Basque peasants, that chiefly compose the army of Don Carlos, have

not had much experience in sieges, and are not very likely, we should think, to quit their own mountains, where they are strongs to follow the enemy to a field of their own choosing, where they would lose all their advantages, and be comparatively weak.

In the mean time, by an order in council dated the 9th of June, the government of this country has suspended the Foreign Enlistment Bill in favour of the Constitutionalists; and we may confidently rely on the slowness and indecision of both parties, which will no doubt allow plenty of time for the British auxiliaries, who under this permission are about to proceed to the seat of war, to reach Spain before anything decisive takes place. The worst news for the Constitutionalists is, that the Catalonians have lately shown a pretty general disposition to take up arms in favour of Don Carlos. As they are a privileged people, like the inhabitants of Biscay and Navarre, under the old laws of the monarchy which the Pretender swears to respect, he has always had a party among them, and that party has been strengthened by the evasion and flight from France of the Count d'Espagne, who, it appears, after visiting Don Carlos' head-quarters, has returned among them. The Count, who is a fiery absolutist, possesses extraordinary influence throughout Catalonia. The manner in which he escaped is not very honourable; but honour and a man's word and oath are apt to be held as nothing when he can once persuade himself that all he does is for the cause of God and his legitimate king. According to a respectable French paper, "M. le Count d'Espagne had only received permission to sojourn on the French territory, on condition of residing at a very considerable distance from the frontiers of the Pyrenees, and not to take any part in any political intrigue. In order to assure itself that this engagement would be fulfilled," the government caused the Count to be the subject of a continued surveillance. This surveillance having greatly annoyed him, he requested to be relieved from it, 'on his engaging his word and honour, and that in writing, not to leave Tours without the consent of the French government. The following is the letter containing the engagement of the Count d'Espagne, the original of which is in the hands of the Minister of the Interior:—

"'I have the honour to thank you for the pains you have taken to cause to cease that surveillance of which I was so unjustly the object; and I promise, on my word of honour, not to leave Tours without your permission, so long as I shall not have obtained the revocation of the order which sent me here.

"'Your very humble servant,

"'THE COUNT D'ESPAGNE.'

"It was by breaking this written engagement that the Count d'Espagne succeeded in evading the police."

On the 14th of June the Carlists began to bombard Bilboa, but their attack was badly managed, the town was well disposed and garrisoned, and Valdez was in a state to succour it, if necessary, from Pampeluna. An English man-of-war in port at Bilboa, landed some guns and men for the protection of British property in the town.

The last news that has reached us through France, is very important, but in some particulars requires confirmation. We give it as we received it. On the 11th of June Triarte defeated with great loss a Carlist Corps which had advanced to an open position only two leagues from Vittoria. On the 16th of June, Zumalacarreguy, who had approached Bilboa, which a part of his army was still bombarding, was dangerously wounded in the right thigh, and compelled, in consequence, to give up his command to Eraso, and retire to Durango, whither he was carried in a litter. The loss of this chief, or even the circumstance of his being put *hors-de-combat* for any length of time will be a serious detriment to the cause of Don Carlos, who has no officer that can at all supply his place. On both sides there is surprising paucity of military talent, Saarsfeld being probably the best General on the Queen's side.

The intelligence which follows is authentic, and has been officially announced in the Government Gazette at Madrid.

The chief minister, Martinez de la Rosa, whose fall has been so often reported, has sent in his resignation, and the new cabinet is thus composed:—

Count Toreno, President of the Council of Ministers, and Minister of Foreign Affairs; M. Mendizabal (financial agent in London to the Portuguese Government), Minister of Finance: Marquis de Las Amarillas, Minister of War; M. Garcia Herreros, Minister of Grace and Justice; M. Alvarez Guerra, Minister of the Interior; General Alava, Minister of Marine.

Intelligence of the suspension of our Foreign Enlistment Bill has reached Madrid, where the prospect of the speedy appearance of Colonel Evans, with his British corps d'armée, has given great joy to the constitutionalists, who now hope, by such assistance, to be able to dispose of the Carlists without any more direct intervention on the part of the English, French, or Portuguese governments. They have sent agents into France to engage Polish, Italian, and German Refugees, and King Leopold is permitting them to recruit among the Belgians. Only the want of money can hinder them from raising a strong mercenary army. On the other hand, a curious report is in circulation, that the Emperor of Russia has invited the exiled Poles to enter the army of Don Carlos, promising them that when the good cause has triumphed, they shall all be pardoned and permitted to return to their homes.

In this brief summary of events we need not go into the question of the armed interference to which we were certainly bound by the quadruple alliance treaty. The present arrangement, is probably, under all circumstances, as much better for the parties interested, than the marching of a French army, and the sailing of an English fleet, as a settlement of the question, and the expulsion of Don Carlos by the Spaniards themselves would have been better than this arrangement, which makes the national cause – the decision whether constitutionalism or absolutism shall be the future rule of Spain—depend, in a great measure, on foreign bayonets; whereas it ought to have been worked out by their own feelings, convictions, and exertions.

Some thousands of stands of arms, with abundance of ammunition, have been sent from England by our Government, which is to give the Spanish Court a long credit for the amount.

PORTUGAL.

HERE there have been other and sweeping alterations in the cabinet. The Lisbon Gazette of the 27th of May, contained the following royal decree:—

"Considering the circumstances which concur in the person of the Marquis de Saldanha, Counsellor of State, I have thought fit to appoint him Secretary of State for the Affairs of War.

"Let the Count de Linhares, Minister and Secretary of State for the Affairs of the Marine, President of the Council of Ministers, thus understand it, and cause the same to be executed.

"Palace of the Necessidades, May 26.

(Signed by her Majesty's sign manual.)

"To the Conde Linhares."

On the next day the Marquis Saldanha was appointed President of the Council of Ministers, and the following cabinet was constructed:—

"The Duke of Palmella, Minister for Foreign Affairs, instead of the Count of Villa Real, who also held the War Department pro tempore.

"Senhor Joao de Souza Pinto Magalhaes, Minister for the Home Department, instead of Agostinho Jose Freire.

"The Marquis de Loule takes the place of the Count de Linhares as Minister for the Affairs of the Marine and Colonies.

"Senhor Francisco Antonio de Campos succeeds to the Department of Finance, which has hitherto been so ably directed by Jose da Silva de Carvalho.

"Senhor Manoel Antonio de Carvalho supplies the place of Manoel Duarte Leitao, as Minister and Secretary of State for Ecclesiastical and Judicial Affairs."

The country seems to enjoy considerable tranquillity, and the only recent quarrels at Lisbon have been between ministers and certain British and other foreign officers who had become clamorous for their arrears of pay. A considerable force of horse and foot is now kept on the frontiers of Gallicia to assist the Queen of Spain in case of need.

Donna Maria's marriage has not been settled as yet. Some of the Portuguese papers continue to speak of Louis Philippe's second son, the Duke of Nemours, as the most eligible match.

GERMANY.

ACCORDING to several of the newspapers of this country, the Grand Duchy of Baden has at length consented to join the Prussian trade-league, or, as it is now called in all the North, the general commercial union of Germany. The journals overflow with articles in praise of this league, which, they assert, will support German manufactures against those of England and France. They seem to contain very little more home news, except a long story about a mad soldier who blew up the powder magazine near Munich, and himself with it.

We have had occasion to allude more than once to certain differences which have long existed between the Emperor of Russia and the King of Prussia, respecting the precise demarcation or line of frontiers between the Prussian dominions of Silesia and Poland. It is now said that these disputes have been amicably arranged, and that the ratifications of a treaty of final adjustment were exchanged at Berlin some two months since.

A newspaper article, dated Vienna, speaks of the new steam navigation of the Danube as being very prosperous and rapidly improving. From the same quarter we learn that the new emperor has shortened the term of confinement of three of the political prisoners of Spielberg.

The grand review of Prussian and Russian troops which was to have taken place in the spring at Kalish, has been postponed. The emperor of Austria has been earnestly invited to be present at it.

The governments of Bavaria, Wurtemberg, and Baden, have renewed in some degree their ancient amicable relations with their Swiss neighbours, in consequence of notes and explanations addressed to them by Berne as the Vorort, or president, for the time being of all the cantons.

[By mistake an acknowledgment was omitted in our last number of a letter received from an intelligent correspondent on the subject of the constitutional changes in the government of Denmark. If the writer of it will compare the simple result of his own statements with our short notes on that head, he will see that there is no material difference between us. As he seems to possess good sources of information we should feel obliged to him for any intelligence he may receive of an important change. There are certain quiet, respectable countries which our journalists and purveyors of news seldom or ever touch upon, and Denmark is one of them.]

CHRONICLE OF OCCURRENCES.

May 20. At a convocation held at Oxford, it was proposed to substitute at matriculation a subscription to the following declaration, instead of the usual subscription to the thirty-nine articles:—"I. A. B. declare that I do, so far as my knowledge extends, assent to the doctrines of the United Church of England and Ireland, as set forth in her thirty-nine articles; that I will conform to her liturgy and discipline; and that I am ready and willing to be instructed in her articles of religion, as required by the statutes of this University." On a division, the numbers in favour of the alteration were 57, and against it 459.

— A meeting was held at the British Coffee House, Cockspur Street, Westminster, T. W. Coke, Esq. in the chair, at which it was resolved to establish a Reform Association, to ensure the registration of the electors of Great Britain and to protect them in the independent exercise of the elective franchise. A large number of names of noblemen and gentlemen appear in the published list of the committee; and G. Grote, Esq., M.P. is appointed treasurer of the association.

— At a meeting of the Pitt Club, held in Edinburgh, it was, on the motion of Lord Meadowbank, unanimously resolved to appropriate 1000*l.* sterling for the establishment, in the University of Edinburgh, of a prize to be given annually to the most deserving of the students attending the Divinity Hall, and which should be termed and known by the name of the "Pitt Prize." The trustees appointed were his Grace the Duke of Gordon, the Earl of Glasgow, Viscount Melville, and Lord Meadowbank, to whom were committed full powers as to the regulations under which the prize should be bestowed.—*Scotsman.*

27. At the close of the contested election for South Staffordshire, (which the newspapers state to be the only contested election which has occurred there for the last 85 years) a disturbance took place at Wolverhampton, which led to the reading of the Riot Act and the intervention of the military. Several individuals received gunshot wounds in the affray, and others were injured in the crowd and confusion of the riot. Sir Frederick Roe was soon after sent down by government to investigate the matter. At first the inquiry was made private, and strangers and reporters were excluded, but on the representation of various parties who took a deep interest in the matter, an order was sent from the Home Office that the examinations should be conducted in public. The evidence taken has been reported in the newspapers, but nothing further has yet been done.

29. The London Pitt Club celebrated its triennial commemoration of the birth of the Right Hon. William Pitt, in Merchant Taylors' Hall, Lord Viscount Mahon was in the chair, and amongst the company, which was very numerous, were the Duke of Wellington, Marquises Camden, Chandos, Salisbury, Earls Dartmouth, Lonsdale, Brownlow, &c. Sir Robert Peel was not present.

— Mr. Hill applied, in the Court of King's Bench, for a writ of *habeas corpus ad testificandum*, to bring up a person of the name of Pilgrim, who was in the gaol of Norwich, to give evidence before the Ipswich election committee. The application was granted.

30. Lord Palmerston was elected for Tiverton without opposition, the representation of the borough being become vacant by the retirement of J. Kennedy, Esq.

June 2. The Rev. Mr. Dawson, a clergyman of the church of England, was murdered at Ballinacraig, about nine miles to the southward of Limerick. It is stated that the murder arose out of disputes with a portion of the rev. gentleman's tenantry respecting the renewal of their leases.

4. The anniversary of the charitable schools of the metropolis was held, as usual, in St. Paul's Cathedral The sermon was preached by the bishop of Worcester. Amongst the audience was prince Jameh-ood-deen, a son of the celebrated Tippoo Saib, and one of the hostages given to Lord Cornwallis in 1792, who is at present on a visit to this country.

5. At the Kent special sessions, the grand jury found a true bill against eighteen persons, most of whom were labourers, for being concerned in riots which took place on the introduction of the New Poor Law Bill into that district, and the consequent change of system. On the trial, several of the prisoners received good characters from the parochial officers. They were all found guilty, but were recommended to mercy.

6. The third anniversary of the London Almshouses Institution, to celebrate the passing of the Reform Bill, was held in the London Tavern, Lord Brougham in the chair.

8. Miss Kelly took a farewell benefit at Drury Lane Theatre, which was crowded on the occasion. In her parting address, she assigned the declining taste for theatrical performances as one cause of her quitting the stage.

The ceremony of distributing the rewards adjudged by the Society of Arts during the present session to successful essayists in matters connected with the arts and sciences, took place at Exeter Hall. Admiral Sir E. Coddrington, Bart., M.P., was in the chair.

9. The triennial ceremony, called the Eton Montem, which is always celebrated on Whit Tuesday, took place. Their Majesties, who were present, and the weather being fine, the company was very numerous.

11. At a meeting of the Merchant Tailors' Company, held according to annual custom, for the purpose of electing the head scholars of the School to St. John's College, Oxford, Viscount Canterbury, the late speaker of the House of Commons, was presented with the freedom of the company, after which a large party dined in the Hall.

17. The forty-seventh anniversary of the Literary Fund was celebrated at the Freemason's Hall. The Duke of Somerset was in the chair. On the health of Azmi Bey, the patron of the Lancasterian system in Persia, being drank, the compliment was acknowledged by him through his interpreter, who stated that full 10,000 children were receiving instruction under the Lancasterian system in Persia.

18. William Cobbett, M.P. for Oldham, died this day, aged as stated by his son, about 73 years. The disease of which he died was inflammation of the throat, with which he had been attacked only a few days before. He retained his faculties to the last, and died without enduring much suffering.

— An explosion took place at one of Mr. Russell's mines at Wallsend, about four miles from Newcastle. Upwards of an hundred individuals, most of them young men and boys, lost their lives by this melancholy occurrence.

Government has converted the loan of 20*l.* to emigrants proceeding to Australia into a gift, and has issued orders that all outstanding boons be remitted, so as to place those who have already received assistance on the same footing with those who will receive it on the new arrangement.

☞ *The Office of the Society is at* 13, *Pall-Mall East. Clerk*, Mr. T. W. PARKES.

THE GLASS MANUFACTURE.

THE beautiful art of making glass was known in ancient times not only to the Romans but to the people of India, and also in all probability to other oriental nations. Its invention indeed was attributed by the Romans to the Phœnicians: the common story being, that the crew of a merchant vessel of that country having landed at the mouth of the river Belus, had accidentally fallen upon it by using some pieces of nitre with which the vessel was loaded, in supporting their kettles on the fires which they kindled on the sand to cook their victuals. The nitre, which is an alkali, combining with the sand in fusion, produced lumps of glass. Pliny, who in his Natural History gives us this account, informs us also that the Phœnicians were wont to shape the articles which they formed of glass sometimes by blowing, and sometimes by grinding them on a lathe, and that they possessed the art of tinging the glass with different colours. We still possess many specimens of Roman vessels made of glass, and from the prices which are recorded to have been paid for some articles of this description, we may infer that the ornamental manufacture had been carried to a considerable degree of perfection and splendour. Pliny mentions two glass cups for which Nero gave 6000 sestertii, which, however, is not, according to the ordinary method of reckoning, 50,000*l.*, as stated by Mr. M'Culloch in his "Commercial Dictionary" (apparently from confounding *sestertii* with *sestertia*), but only about 50*l.* of our money. But like many of the other arts, which were very successfully cultivated by the ancients, in so far as they could be made to minister to the wants of the few wealthy persons in the community, the manufacture of glass does not appear to have been extensively applied by them to purposes of general utility. In particular, the most important modern application of glass, its employment in windows, was probably altogether unknown. "There is no authentic evidence," says Mr. M'Culloch, "of glass being used in windows previously to the third or fourth century; and then, and for long after, it was used only in churches and other public buildings."

Like most of the other processes, however, which had become subservient in any of their applications to the needs of common life, the art of making glass seems never to have been lost after its first introduction. With the household arts and all the ordinary handicrafts, it probably survived the great overthrow of ancient European civilization, the destruction of the Western empire, in which so many of the luxurious arts wholly perished. The modern nations of Europe appear to have received the art originally from the Italians.

"In this country," says Mr. M'Culloch, "even so late as the latter part of the sixteenth century, glass (he appears to mean, in windows) was very rarely met with. In a survey of Alnwick Castle made in 1573, it is stated—'And because through extreme winds the glass of the windows of this and other my lord's castles and houses here in the country doth decay and waste, it was good the whole lights of every window, at the departure of his lordship from lying at any of his said castles and houses, and during the time of his lordship's absence, or others lying in them, were taken down and laid up in safety; and at such time as either his lordship or any other should be at any of the said places, the same might then be set up of new, with small charges, whereas now the decay thereof shall be very costly and chargeable to be repaired.' (Northumberland Household Book, xvii.) Sir F. M. Eden thinks it probable that glass windows were not introduced into farm-houses in England much before the reign of James I. They are mentioned in a lease in 1615 in a parish in Suffolk. In Scotland, however, as late as 1661, the windows of ordinary country-houses were not glazed, and only the upper parts of even those in the king's palaces had glass, the lower ones having two wooden shutters, to open at pleasure, and admit the fresh air. From a passage in Harrison's Description of England it may be inferred that glass was introduced into country houses in the reign of Henry VIII. He says—'Of old time,' (meaning, probably, the beginning of the century,) 'our country houses, instead of glass, did use much lattice, and that made either of wicker or fine rifts of oak, in chequerwise; I read also that some of the better sort, in and before the times of the Saxons, did make panels of horn instead of glass, and fixed them in wooden calms (casements); but as horn in windows is now (1584) quite laid down in every place, so our lattices are also grown into disuse, because glass is come to be so plentiful, and within very little so good cheap, if not better than the other.'"

In our edition of Holinshed and Harrison, which is that of 1587, the expression is that lattices had then grown not into disuse, but "into less use." But part of what immediately follows the passage quoted by Mr. M'Culloch, deserves also to be extracted, for the sake of some curious information which it contains, both on the substitutes anciently used for glass in England, and also on the state of the English glass manufacture in the time of the writer. In mentioning the Saxons as above, the writer remarks in a parenthesis that they "notwithstanding, used some glass also since the time of Benedict Bishop, the monk that brought the feat of glazing first into this land." This refers to a statement made by Bede respecting the rebuilding of the abbey and church of Wearmouth in the year 674. "Abbot Benedict," says that historian, "brought over from France, along with other artificers, those skilled in the making of glass, which till then had been unknown in Britain, wherewith he glazed the windows of that church and monastery, and thereby taught the English the art of glass-making, which has proved so useful in making of lamps for churches, and other vessels for divers uses." Harrison goes on: "I find obscure mention of the Specular stone also to have been found and applied to this use in England, but in such doubtful sort as I dare not affirm it for certain. Nevertheless, certain it is that antiquity used it before glass was known, under the name of Selenites." He then tells the story already quoted from Pliny about the alleged discovery of glass-making by the Phœnician mariners; after which he proceeds as follows:—"Now, to turn again to our windows. Heretofore also the houses of our princes and noblemen were often glazed with beryl (an example whereof is yet to be seen in Sudley Castle), and in divers other places with fine crystal, but this especially in the time of the Romans, whereof also some fragments have been taken up in old ruins. But now these are not in use, so that only the dearest glass is most esteemed; for we have divers sorts, some brought out of

Burgundy, some out of Normandy, much out of Flanders, beside that which is made in England, which would be so good as the best if we were diligent and careful to bestow more cost upon it, and yet, as it is, each one that may will have it for his building."

In a preceding part of his treatise (Book I. c. 18) Harrison says — "Glass also has been made here in great plenty before and in the time of the Romans; and the said stuff also, beside fine scissars, sheers, collars of gold and silver for women' necks, cruises and cups of amber, were a parcel of the tribute which Augustus in his days laid upon this island." What the old chronicler's authority for these assertions may be we do not know. Anderson, in his History of Commerce, under the year 1180, has the following paragraph:—"About this time glass windows are said to have been first in any kind of common use in England; they had been discovered long before, but were very scarce in private houses, and ranked even till now as a kind of luxury, and as a mark of great magnificence. Italy had them first, next France, from whence the fashion of using them came into England."

Other kinds of glass, besides that used for windows, had begun to be manufactured in England before the time when Harrison wrote. Dr. Chamberlayne, in his "Present State of England, for 1683," asserts that glasses (for drinking) were first begun to be made in England in the year 1557. "The finer sort," he says, "was made in the place called Crutched Friars, in London." And he adds, "The fine flint-glass, little inferior to that of Venice, was first made in the Savoy House, in the Strand, London; but the first glass-plates, for looking-glasses and coach-windows, were made about the year 1673, at Lambeth, by the encouragement of the Duke of Buckingham." Under the year 1670 Anderson writes, "About this time it was that the Duke of Buckingham sent for the best glass-makers, glass grinders, and polishers, from Venice; which public-spirited design has since so well succeeded, as to be now enabled to send to that very place, and to almost every other part of Europe, and to Asia, Africa, and America, the very finest glass of all sorts that the earth can produce." This was written in 1763.

There is also a very curious passage in Harrison's Description about the drinking-glasses in use in his time in England. In his Second Book, Chapter 6th, "Of the food and diet of the English," he says, "It is a world to see in these our days, wherein gold and silver most aboundeth, how that our gentility, as loathing those metals (because of the plenty), do now generally choose rather the Venice glasses, both for our wine and beer, than any of these metals or stone, wherein before-time we have been accustomed to drink; but such is the nature of man generally that it most coveteth things difficult to be attained, and such is the estimation of this stuff, that many become rich only with their new trade into Murana (a town near to Venice, situate on the Adriatic sea), from whence the very best are daily to be had, and such as for beauty do well near match the crystal, or the ancient *Murrhina Vasa*, whereof now no man hath knowledge. And as this is seen in the gentility, so in the wealthy commonalty the like desire of glass is not neglected, whereby the gain gotten by their purchase is yet much more increased, to the benefit of the merchant. The poorest, also, will have glass if they may, but sith the Venetian is somewhat too dear for them, they content themselves with such as are made at home of fern and burned stone; but in fine all go one way, that is, to shards, at the last; so that our great expenses in glasses (beside that they breed much strife toward such as have the charge of them), are worst of all bestowed in mine opinion, because their pieces do turn unto no profit." And then he adds the following strange remark, with a reference on the margin to Roger Bacon, "If the philosophers' stone were once found, and one part hereof mixed with forty of molten glass, it would induce such a metallical toughness thereunto, that a fall should nothing hurt it, in such manner, yet it might peradventure bunch or batter it, nevertheless that inconvenience were quickly to be redressed by the hammer." This notion will remind some of our readers of a story told by Pliny, about an artist having, in the reign of the Emperor Tiberius, found out the way of making cold glass ductile and malleable. The man, says the story, having presented himself before Tiberius, put into his hands a phial, which the Emperor immediately threw with contempt on the ground. But the man, taking up the fragments, drew a small hammer from his bosom, and with a little beating soon made the phial whole again. The Emperor, on this, having first ascertained that no other person knew the secret, commanded the head of the unfortunate artist to be forthwith struck off, lest by his discovery gold and silver should lose their value. Pliny acknowledges, however, that this story had more currency than credibility. The project of making glass malleable seems to have been a favourite speculation of Harrison's. He returns to the subject in his Third Book, Chapter 11, 'Of metals to be had in our land,' where he complains that the smelting of iron "breedeth great expense and waste of wood, as doth," he adds, "the making of our pots and table vessels of glass, wherein is much loss, sith it is so quickly broken; and yet (as I think) easy to be made tougher, if our alchymists could once find the true birth or production of the red man, whose mixture would induce a metallical toughness unto it, whereby it should abide the hammer." The prejudice entertained against the glass-manufacture, on account of its consumption of wood, breaks out again in the Chronicle, where, under the year 1575, the author writes, "The fourth of September, being Sunday, about seven of the clock in the morning, a certain glass-house, which some time had been in the Crossed Friars' Hall, near to the Tower of London, burst out on a terrible fire; whereunto the Lord Mayor, Aldermen, and Sheriffs, with all expedition repaired, and practised there all means possible, by water-buckets, hooks, and otherwise, to have quenched it. All which notwithstanding, whereas the same house in a small time before had consumed great quantity of wood by making of fine drinking glasses, now itself, having within it near forty thousand billets of wood, was all consumed to the stone walls, which walls greatly defended the fire from spreading further, and doing any more harm." This glass-house in Crossed, or Crutched Friars, was the same in which the finer sort of flint-glass was originally made, as mentioned above on the authority of Chamberlayne. The apprehensions about the waste of timber occasioned by the glass and iron manufactures continued to prevail long after Harrison's time. Some notices of the precautions adopted under the influence of this alarm in the case of the manufacture of iron may be found in our article on that manufacture, in the fifteenth number of the *Companion*. It appears that in 1619, Sir Robert Mansel, having discovered a method of making glass with coal, obtained a grant from James I., prohibiting all persons for a certain period from using timber for that purpose. The principal pretence for the prohibition was the better preservation of timber; but as the grant also prohibited the importation of foreign glass, we may infer that its real object was to secure to Mansel a monopoly of his invention, for which favour his majesty no doubt had received a proper consideration. This grant is recited in a proclamation issued in 1635 by King Charles I., which is printed in Rymer. "Yet," the proclamation proceeds, "ill-minded persons, to the prejudice of our own glass-works, having presumed to import foreign glass, we now strictly prohibit the same during the term granted by King James to Sir James Mansell for the sole making of glass; he having, by his industry and great expense, perfected that manufacture with sea-coal or pit-coal; whereby not only the woods and timber of this kingdom are greatly preserved, but the making of all kinds of glass is established here, to the saving of much treasure at home, and the employment of great numbers of our people; and our subjects are now furnished with glass at far more moderate prices than they were when brought from foreign parts." "Yet the king," says Anderson, from whom we take the notice, "permits the said Sir Robert Mansell to import such glasses from Venice, Morana, or other parts of Italy, as he should think fit, for special uses and services. This permission, without doubt, related to the fine Venetian flint-glasses for drinking, the making of which in England was not brought to perfection till the reign of King Charles's grandson, King William III."

The present state of the glass manufacture is the subject of the Thirteenth Report of the Commissioners of Inquiry into the Excise Establishment, which has just been laid before Parliament by the command of his Majesty. This Report, together with an appendix of documents and evidence, makes a folio volume of 158 pages. We shall endeavour to present an abstract of the most important of its statements, but without adhering in all cases to the order in which the different topics have been arranged by the Commissioners.

It may be necessary to premise that the several kinds and denominations of glass are the following:—

1. Flint Glass, of which are made drinking glasses, and most ornamental articles, and under which name are included enamel, stained, and paste glasses. By the present law, also, all "bottles of less size or content than what is commonly deemed and reputed a half pint bottle," must be made of flint, or, as it is often called to distinguish it from the material of common bottles, white glass; such small bottles are legally termed phials. Flint glass is also called glass of lead, because a considerable portion of it consists of that metal. It is not now manufactured, as originally, of ground flints, but of purified sand.

2. Plate Glass, or cast plate glass, called also glass of pure soda, because in manufacturing it carbonate of soda is employed as the flux, or ingredient for promoting the melting of the composition. All mirrors are made of plate glass, and it is also sometimes employed in windows. The very large pieces of glass forming the windows of many of the London shops are of plate glass.

3. Crown Glass. This is the proper window glass, of the finer sort. It is manufactured of sand vitrified by kelp. Under the same head with crown glass is included what is called German sheet glass, which is made from coarser materials, and is generally considered to be an inferior article.

4. Broad or Spread Glass, which is the coarser kind of window glass, and is made from a mixture of soapboilers' waste, kelp, and sand.

5. Bottle, or Green Glass, the material of all bottles except phials. It is made of sand and soapboilers' waste, without the addition of any fresh kelp.

It thus appears that Mirrors are made only of plate glass; Windows of crown glass, German sheet glass, broad glass, and sometimes of plate glass; Vessels for drinking and other purposes, and ornamental articles, of flint glass, and the coarser of green or bottle glass. Flint glass is commonly blown, but sometimes moulded or pressed;—Plate glass is commonly cast by being poured upon an iron table, and then having a roller passed over it; but it is also sometimes blown;—Crown glass is blown into hollow spheres, which being then perforated, are what is called *flashed*, that is, expanded by a rapid rotary motion into circular sheets called tables;—German sheet glass is blown into hollow cylinders, which are not flashed, but cut or split longitudinally, and flattened by pressure into tables of a rectangular shape;—Broad glass is blown like crown glass;—Bottle-glass is blown at once into the shape required. All kinds of glass, therefore, are most commonly shaped by blowing, except plate glass, which is usually cast.

The Report commences with a detail of the successive enactments of which the English glass manufacture has been the subject. "A duty upon glass wares," it is stated, "was first imposed by a statute of 6 and 7 W. and M., which enacts that a sum, varying in amount to the nature of the articles therein specified, shall be levied upon all such wares, whether manufactured in England, or imported from foreign ports. This duty, which had been granted for five years, was continued and made perpetual by an Act of the following year. By a statute of the session immediately succeeding, after reciting that 'it is found by experience that the said rates and duties upon glass and glass wares are too great, so that the makers of those manufactures in this kingdom are thereby discouraged,' it is enacted that one-half part of the said rates and duties should cease and determine. By another Act passed in the following year (10 and 11 Wm. III. c. 18), after reciting that 'it is found by experience that the remaining duties on glass and glass wares are very vexatious and troublesome in the levying and collecting the same, and of small advantage to the Crown, and should the same be continued would lessen the duty on coals much more than the said duties on glass wares will amount to, will hinder the employing great numbers of poor, and endanger the loss of so beneficial a manufacture to this kingdom,' it was enacted that the remaining moiety or half-part of the rates and duties imposed by the aforesaid Acts upon the said glass or glass wares should cease and determine.

"The preambles which we have quoted from the above-mentioned obsolete statutes appear to us to be worthy of attention, as placing upon record the impression produced upon the legislature of that day by an experience of two or three years of the effects resulting from the imposition of an Excise duty on glass; and we may add, that the repetition of the same experiment subsequently made, after the lapse of about half a century, will be found to have been attended with the same effects as those which are described in the statute of Wm. III., namely, that the 'rates and duties upon glass and glass wares are too great, and that this beneficial manufacture has been thereby discouraged.'"

After this the glass manufacture remained free from any duty for about forty-six years. At length in 1746 (by the 19 Geo. II. c. 12) all materials used in the manufacture of crown, plate, and flint glass, were subjected to a duty of 9*s.* 4*d.*, and all those used in the manufacture of green glass to a duty of 2*s.* 4*d.* the hundred weight, such duties to be under the management of the Excise; a protection being at the same time granted to the manufacturer by the imposition of certain additional duties upon all foreign glass imported into England.

The duties thus imposed were varied and increased by a long succession of subsequent Acts. At length in 1813 the duties on all the descriptions of the manufacture were at once raised to double their previous amount; that on flint and plate glass from 2*l.* 9*s.* to 4*l.* 18*s.* per cwt.; that on crown glass and German sheet, from 1*l.* 16*s.* 9*d.* to 3*l.* 13*s.* 6*d.*; that on broad glass from 15*s.* to 1*l.* 10*s.*; and that on bottle glass from 4*s.* 1*d.* to 8*s.* 2*d.*

The duties continued at these rates till 1819, when that on plate glass was reduced to 3*l.* "This reduction," the Commissioners remark, "was probably made in consequence of the progressive falling off of the manufacture, and of the produce of the duty, in the six years succeeding the imposition of the high rate. In 1825 the change was made in the mode of taking the duty on flint and phial glass, by charging the duty on the pound weight of the fluxed materials, with a further charge per pound on the excess of the weight of the manufactured article above the weight of the materials. The last change in the rates of duty appears to have been in the year 1830, when the rate on common bottles was reduced from 8*s.* 2*d.* to 7*s.* per cwt. This reduction, however, does not appear to have been attended with a corresponding increase of consumption, the last year of the lower duty having produced about 10,000*l.* less than the last year of the higher rate."

From a return by the Excise Office specifying the rates of duty and gross amount of duty received upon each denomination of glass in each year since 1770, and from other accounts given in the report and the appendix, we abstract the following statements. Shillings and pence are omitted in the sums.

In 1770 the total gross amount of duty received upon glass in England was 85,260*l.*; being upon bottle glass 25,759*l.*, and upon all other descriptions, 59,500*l.*

In 1777, no change of rates having taken place in the mean time, the bottle glass duties yielded 28,994*l.*, and those on other descriptions, 67,343*l.*, making in all 96,337*l.*

In 1778 the duties upon plate and flint glass were doubled: those upon crown and German sheet were raised from 9*s.* 4*d.* to 14*s.*: those upon bottle glass were raised from 2*s.* to 3*s.* 6*d.*, and a duty of 7*s.* per cwt. was for the first time imposed upon broad glass. The result was, that that year the gross amount of duty was 131,817*l.*; namely, from flint and plate, 40,176*l.*; from crown and German sheet, 44,310*l.*; from bottle, 39,627*l.*; and from broad, 7703*l.*

For some years following, however, the produce of the duties rather declined. In 1781 it amounted to 131,415*l.*; namely, from flint and plate, 13,655*l.*; from crown and German sheet, 46,486*l.*; from bottle, 34,072*l.*; and from broad, 7200*l.*

In 1793, a slight increase of the rates having taken place in the interval, the duties on flint and plate produced 67,423*l.*; those on crown and German sheet, 73,769*l.*; those on bottle, 54,626*l.*; and those on broad, 8581*l.*; making in all 204,400*l.*

In 1794 the duty on flint and plate was raised from 1*l.* 1*s.* 5½*d.* to 1*l.* 12*s.* 2½*d.*, and that on crown and German sheet, from 16*s.* 1¼*d.* to 1*l.* 4*s.* 2*d.* In 1795 the flint and plate duties produced 88,632*l.*; the crown and German sheet, 71,763*l.*; the bottle, 47,617*l.*; and the broad, 8883*l.*; making in all, 216,897*l.*

In 1804, up to which time the duties had been increased only by a few pence per cwt., the produce of the flint and plate duties was 120,593*l.*; that of the crown and German sheet duties, 103,058*l.*; that of the bottle duties, 53,185*l.*; and that of the broad duties, 5205*l.*; making in all 282,043*l.*

In 1805 the duties on flint and plate were raised to 1*l.* 12*s.* 8*d.*; those on crown and German sheet to 1*l.* 16*s.* 9*d.*; and those on broad to 12*s.* 3*d.* In 1807 those on flint and plate were farther raised to 2*l.* 9*s.*; and in 1810 those on broad glass were raised to 15*s.* In 1811 the gross receipts were, from flint and plate, 222,365*l.*; from crown and German sheet, 157,205*l.*; from bottle, 67,819*l.*; and from broad, 7251*l.*; making in all 454,641*l.*

In 1813, as already mentioned, the rate of duty upon every description of glass was doubled. Plate glass, which hitherto had been classed with flint, was now also classed as a separate description. In 1814 the gross amount of the duties received on flint glass was 240,476*l.*; on plate, 45,345*l.*; on crown and German sheet, 369,004*l.*; on bottle, 95,538*l.*; and on broad, 12,942*l.*; making in all 663,308*l.*

It appears, therefore, that the increase of the duty, though it brought a considerably larger sum into the Exchequer, diminished the consumption of glass upon the whole, and must have operated as a check upon the manufacture. The effect upon the consumption of plate glass in particular was very perceptible. In 1816 the duties received on that description of glass declined to 36,795*l.*, and in 1817 to 21,502*l.* In 1820 the duty having, as stated above, been lowered in the preceding year to 3*l.*, the amount received was 27,192*l.* The consumption has since increased, as we shall have occasion to notice in the sequel, from a cause which has operated favourably in spite of the duty; but still it appears to fluctuate considerably. In 1834 the produce of the duties was 56,781*l.*, but in 1832 it was only 36,810*l.* The consumption of flint glass, again, taking into account the increase of the population, must be considered as having also decidedly declined during the seven or eight years immediately following the augmentation of the duty in 1813. In 1820 the amount of the duties received on this description of glass was only 234,691*l.*, and in 1821 it was only 243,378*l.* In 1824 it was 287,799*l.* The same thing may be said of the consumption of the finer descriptions of window-glass, crown and German sheet. In 1820 the duties received on these descriptions amounted only to 258,723*l.*, and in 1821 only to 277,954*l.* In 1830 the amount was only 304,643*l.*, whereas in 1806, when the rate of duty was only half as great, it was 464,684*l.*, indicating a considerably larger consumption. In 1833, however, it rose to 477,693*l.*, and last year it was 502,401*l.* Of broad glass, judging by the produce of the duty, the consumption appears to have been, till very lately, scarcely more than half what it was more than twenty years ago, for in 1811, when the duty was only 15*s.*, it produced 7251*l.*; and in 1830, when it was 30*s.*, it produced only 7267*l.* In 1832 the amount was 7956*l.*, and in 1834, 10,119*l.* The consumption of bottle glass may also be said to have been stationary, if it has not declined. The amount of duties received on this description of glass, under the increased rate, has never yet risen to twice what it was in some years before the increase. For instance, in 1808, it was 65,119*l.*; in 1810, 67,138*l.*; and in 1811, 67,819*l.*; whereas the highest years since the augmentation of the duty have been 1818, when it was only 134,367*l.*; 1826, when it was 135,545*l.*; and 1827, when it was 135,358*l.* In 1828 the duty was reduced from 8*s.* 2*d.* to 7*s.*, and the produce for the last few years has been, in 1831, 85,568*l.*; in 1832, 90,052*l.*; in 1833, 93,902*l.*; and, in 1834, 98,357*l.*

It is to be remembered that all the sums here stated as the amount of duty received in each year, are the mere gross receipts, which must be taken as subject to diminution, not only by the allowances and drawbacks payable to the manufacturers and exporters, but also by the expenses of collection.

The highest gross amount of duty ever received on glass manufactured in Scotland was 169,190*l.*, which was received in 1827. Of this sum 21,229*l.* was derived from duties on flint glass 117,215*l.* from those on crown and German sheet; and 30,716*l.* from those on bottle. There is no plate glass manufactured in Scotland. In 1823 the duties on flint glass produced 23,328*l.*; in 1813 those on crown and German sheet produced 122,869*l.*; and in the same year those on bottle glass produced 29,520*l.* These have been the years of greatest productiveness in each branch of the manufacture. In 1832 the total gross amount of the duties was only 45,191*l.*, namely, 17,861*l.* received from flint glass, 2,318*l.* from crown and German sheet, and 15,308*l.* from bottle.

The first duty imposed upon glass manufactured in Ireland was in 1797, when a duty of 1*s.* 3½*d.* per cwt. was imposed upon bottle glass. Flint glass, the only other description manufactured, was not taxed till 1825. The largest total gross amount of duties received on Irish glass is 26,972*l.*, which was received in 1828, being 23,612*l.* on flint glass, and 3360*l.* on bottle glass. In 1834 the total gross amount of the duties was 18,974*l.*, being 14,919*l.* from flint glass, and 4054*l.* from bottle.

The duties on all descriptions of Scotch and Irish glass are now the same as on English, and all the regulations affecting the manufacture are the same for the three parts of the kingdom.

In the Appendix to the Report is given a return furnished by the Board of Excise, specifying the names of the several glass-makers in England, Scotland, and Ireland, respectively, the towns or places in which each manufactory is situated, the district or collection in which it is included, the amount of duty paid by each maker in the year ended 5th January, 1833, and the total number and expense of the officers employed in the collection of each duty. "From this return," the commissioners observe, "it will be seen that the total number of entered glass-houses, in the year 1832, was in England 106, and the total amount of duty received from them was 680,081*l.* 1*s.* 8½*d.*; that in Scotland the number of glass-houses was ten, and the duty received 45,491*l.* 14*s.* 6*d.*; and that in Ireland the number of glass-houses was also ten, but the duty received from them only 22,399*l.* 19*s.* 0½*d.* From this return it also appears that the principal seat of the manufacture is at Newcastle-upon-Tyne, and that from the establishments in that town, and the neighbouring district of Durham, an amount of duty, approaching to a moiety of the whole amount raised in England, is received. The district of manufacture next in extent to those of Newcastle and Durham, is that of Stourbridge, next to which are the works in the district of Liverpool, including those at Ravenhead, then those of Bristol, then those of Warrington in Cheshire, then those of Birmingham, then those of Leeds, with works paying inferior amounts of duty in the several districts of Manchester, Salop, Sheffield, Stafford, York, and within the limits of the chief office in London.

"Of the works in Scotland, the principal are in the Glasgow collection at Dumbarton, the others being in the districts of Edinburgh, Haddington, Ayr, and Stirling.

"In Ireland, the principal seat of the manufacture is in the neighbourhood of Dublin: there are also works at Cork, Waterford, Dundalk, and Lisburn.

"In the above return the expense of the officers employed in the collection of this head of duty is estimated at between seventeen and eighteen thousand pounds per annum, and the estimate is stated to have been formed on grounds similar to those which were used in forming an estimate for a purpose of the same kind with respect to the duties on soap. We have reason to think, however, that the statement as to glass will be found to be considerably below the real cost of the survey. We believe it will be admitted, that amongst all the growing-duty trades, including soap, there is not one upon which the survey is maintained at so heavy an expense as upon glass.

"We have already had occasion to observe upon the difficulty of obtaining an accurate estimate of the expense at which these excise surveys are maintained on any one class of traders, in consequence of the same officers being employed in the superintendence of several descriptions of traders: this diversity of employment, however, prevails less with respect to glass than with respect to other exciseable articles, since the attention of the officers stationed at a flint glass work is required to be unremitting during the twenty-four hours. Taking the number of glass houses in the United Kingdom at 130, many of which require the constant attendance of three officers, we are satisfied that the cost of the mere survey must be estimated at a considerably higher amount than what is above stated, and at all events it must be recollected that to this estimate must be added a portion of the expense incurred on account of supervisors and other superior or check officers, as well as the expense attending the superintendence of the exports and the allowance of the drawbacks, and that relating to the accounting for and management of this head of duty at the chief office.

"We also insert another account, which we have obtained from the Board of Excise, in which is stated the aggregate amount received from the glass duties in the year 1834, in

the several parts of the United Kingdom, distinguishing the gross receipt from the net receipt:—

	Gross Receipt.	Net Receipt.
England . .	£861,777	£627,803
Scotland . .	36,377	23,466
Ireland . .	18,668	15,176
	£916,822	£666,445

"The sum here stated as the gross receipt for the year 1834, it will be seen, varies in some degree from the sum appearing as the aggregate receipt for the same year in the general account inserted in a preceding page; this difference, however, we apprehend may be explained by the circumstance of the two accounts having been made up to different periods of the year. Our principal reason for calling attention to this separate account for one year is, because it bears upon the face of it one of the strong grounds of objection to be urged against this tax, namely, the large amount of difference between the gross and the net produce; and it must at the same time be observed, that this difference, amounting to 250,377*l.*, includes only those deductions from the gross receipt which consist of allowances made to the persons from whom the tax is collected, in the shape of repayments and drawbacks, and that the sum which is actually applicable to the public service as the produce of this tax, is still further diminished by the whole expense incurred by the department of Excise on account of the charge, collection, and management of this head of duty; so that it will be found that when that deduction has been made, the sum which, correctly speaking, ought to be returned as the net produce of the tax, will not be more than about two-thirds of its nominal gross amount."

The drawbacks allowed upon the exportation of glass to foreign parts, are principally the following:—For every square foot of ground or polished plate glass, 2*s.* 9*d.*; for every cwt. of unground or unpolished plate glass, 3*l.*; for every cwt. of crown or German sheet glass, 3*l.* 13*s.* 6*d.*; for every cwt. of panes of ditto, 4*l.* 18*s.*; for every cwt. of broad glass, 1*l.* 10*s.*; and for every cwt. of common bottles, or other vessels or utensils made of bottle glass, 7*s.*

The regulations established by law in regard to the manufacture of the different descriptions of glass, are so multifarious and complex that it is impossible for us here to do more than notice a very few of them, by way of sample. The extract, comprising a detail of them, which the commissioners give from the printed regulations of the Excise, extends to nearly six folio pages.

Among other things, only one of the five descriptions of glass can in any case be made in the same glass-house, with the single exception that plate glass may be made in a glass-house entered and used for making crown glass. Every glass-maker must annually make entry of his name, and of all workhouses, furnaces, pots, pot-chambers, annealing arches, warehouses, rooms, and other places intended to be made use of by him for making or keeping glass, or materials mixed and prepared for making glass, and of every lear for annealing glass, and mark and number every workhouse, pot-chamber, &c. so entered, and take out and pay for a licence for each glass-house, the duty on which is 20*l.* Then comes a host of minute enactments with regard to the construction of the ovens, the length of notices to be given before heating the annealing arch, charging the pots, drawing the glass from the lear, and indeed almost every other operation of the manufacture. "A very slight examination of these complicated regulations," the Commissioners remark, "will be sufficient to show in how great a degree they must necessarily interfere with the process of manufacture, and, in fact, take the general control and management of the business out of the hands of the proprietor; and when it is recollected that the business is one which, for its success, peculiarly depends on the application of scientific principles to the various combinations of the materials which are used either as fluxes, or to form the basis of the product, and especially to the due regulation of heat, both as to its intensity and its duration, it will at once be admitted at how great a disadvantage the business must be carried on, when every part of the process is subjected under all circumstances, however various, to a uniform system of regulations prescribed by Act of Parliament."

The Report next proceeds to consider the several branches of the manufacture in succession; but we must reserve our account of this portion of it till our next number.

THE NEW IRISH CHURCH BILL.

The Bill on the subject of the Irish Church, prepared and brought into the House of Commons on the 7th of July by Lord Viscount Morpeth, Lord John Russell, Lord Viscount Howick, Mr. Chancellor of the Exchequer, Sir John Hobhouse, Mr. Poulett Thomson, Mr. Attorney-General, and Mr. Solicitor General, is entitled "A Bill for the better regulation of Ecclesiastical Revenues, and the Promotion of Religious and Moral Instruction in Ireland," and consists of 101 clauses, as ordered by the House to be printed on the same day.

The preamble, after noticing the facts that various acts have been passed for the establishment of compositions for tithes throughout Ireland without effectually attaining the object of rendering the incomes arising from that source certain in amount and easy of collection—that a commission had been issued by his Majesty on the 5th of August last for inquiring whether adequate provision is now made for the religious instruction and for the general education of the people of Ireland—and that it appears by the first report of the said commission that in some parishes there are few members of the Established Church, and in other parishes no such members—proceeds as follows:—"And whereas it is just and necessary for the establishment of peace and good order in Ireland, and conducive to religion and morality, that after adequate provision made for the spiritual wants of the members of the Established Church, the surplus income of such parishes shall be applied to the moral and religious education of the people, without distinction of religious persuasion; and also that the said compositions for tithes shall be made payable by persons having a perpetual estate or interest in the lands subject thereto, a reasonable deduction being made upon the amount thereof, in consideration of the greater facility and security of collection arising out of such transfer of the liability to the payment thereof, from the occupying tenantry to the owners of such estates or interests."

Clause 1st abolishes the right of all persons in and to all tithes or compositions of tithes heretofore accrued, except arrears by or to persons entitled to the receipt or bound to the payment of the same by any agreement entered into under the tithe-composition act passed in 1832, and except tithes or compositions for the recovery of which any suit shall have been commenced previous to the 20th of March last.

The second clause enacts that in lieu of such tithes or tithe compositions all lands subject to their payment shall in future be charged with an annual rent-charge, equal to seven tenths of such compositions, to be payable by the party having the first estate of inheritance in the lands. Several following clauses relate to the manner in which this leading provision is to be carried into effect in various cases. Clause 7th enacts that the said rent charges shall be under the management of the Commissioners of Land Revenues, subject to the control of the Commissioners of the Treasury.

Clauses from 9 to 20 inclusive relate to the revision of existing compositions, on application to the said Commissioners, at any time within six weeks after the passing of the act, by any person or persons in any parish who would have been, in case this act had not been made, individually or collectively liable to the payment of more than one half of the amount of the whole composition established in and for such parish. Every such application must be accompanied by a statement in writing of the grounds and reasons for making the same, the material allegations being verified by the oath of some one or more credible person or persons. If the Commissioners shall, upon this representation, find adequate ground for the revision, they shall transmit a certificate to that effect to the lord lieutenant. The lord lieutenant is to appoint so many barristers as may be thought necessary, of not less than six years standing at the Irish bar, to act as revising barristers of all such compositions, and shall refer each case that may occur to any three of them. Various regulations are then laid down with regard to the manner in which the revisers are to proceed, the authority they are to possess, &c. Each is to be paid at

the rate of five guineas for every day that he shall be employed, over and above his travelling expenses, by the parties interested in the case, in such proportions as the lord lieutenant shall direct. Appeals respecting compositions now before the Privy Council may be referred to the barristers thus appointed.

Several enactments then follow, regulating the manner of proceeding in cases where the liability of lands to the rent-charge shall be disputed, and in other actions commenced under the act. By the 34th clause it is enacted that the rent-charges to be thus substituted for tithes shall have priority over all other charges, leases, mortgages, and incumbrances whatsoever.

The 39th clause enacts that for the purpose of calculating the amount of the rent-charges to be fixed in lieu of tithe compositions, the Commissioners of Land Revenue shall compare the average price of corn during the seven years now last past with its price as stated in the original certificate of the composition, and shall increase or diminish the amount of the new impost accordingly; and a similar re-adjustment is to be made every year.

By clause 10th the Ecclesiastical Commissioners are directed, on, or as soon as conveniently may be after the 1st of December in this present year, and on or after the 1st of November in every succeeding year, to cause an account to be taken of the gross amount of the rent-charges then accrued due out of each parish, and issue warrants to the parties entitled to the several payments on the Commissioners of Land Revenues, deducting, however, sixpence in the pound for the cost of collection. These warrants or cheques will be paid to the holders on being delivered to the cashier or cashiers of the Bank of Ireland appointed for that purpose.

The 12d clause enacts that all present incumbents shall, in addition to the sums thus awarded to them, receive a further payment of 5*l.* per cent. upon the amount of their compositions from the Perpetuity Purchase Fund. But corporations aggregate, incumbents without cure of souls, and lessees of tithes, are excluded from the benefit of this additional payment. Some clauses that follow relate to various subordinate points in the methods of proceeding arising out of the preceding enactments.

The subject of the clauses from 50 to 56 inclusive, which are printed in a different type, is the one million sterling advanced for the relief of owners of tithes by the act of 1833 (the 3 and 4 Will. IV. c. 100). It is enacted that those who have received any part of this advance shall not be liable to be called upon for its repayment; and that so much of the money as has not yet been paid away shall pass into the hands of the Ecclesiastical Commissioners, who shall apply it to the relief of tithe owners who may not have received payment of their compositions for 1834, and shall make application for such relief by memorial to the lord-lieutenant.

The next portion of the act respects the changes which it is proposed to make in the present establishment of the Irish Church.

The first case provided for is that of parishes containing, according to the Report of the Commissioners of Inquiry, not more than fifty members of the Established Church. In regard to every such parish it is enacted that the Ecclesiastical Commissioners shall direct that no appointment to the living shall be made until the lord-lieutenant shall think fit so to direct. In the mean time the church shall be deemed to be sequestered, and for the period it shall remain vacant all the profits and emoluments thereof shall be vested in and received by the Ecclesiastical Commissioners as sequestrators. If there shall be no members of the Established Church in the parish, the occasional ecclesiastical duties are to be performed by the incumbent of some adjoining parish, who shall be nominated by the ordinary, and shall be bound to perform such duties. If there be any members of the Established Church at all in the parish, the Ecclesiastical Commissioners may direct either that the duties shall be performed by the incumbent of some adjoining parish, or that a separate curate shall be nominated and licensed by the ordinary for that purpose.

A separate curate must be appointed in all such parishes, in which there is at present a place of worship duly consecrated, and a resident officiating minister. In cases where there are no members of the Established Church in the parish, the neighbouring incumbent, to whom the duties shall be committed, shall receive from the Ecclesiastical Commissioners an annual stipend of five pounds; and where there shall be some such members, his stipend shall vary from ten to fifty pounds, according as the Commissioners, having regard to the extent of the duties he may have to perform, shall, with the consent and approbation of the lord-lieutenant, appoint. When a separate curate is appointed, he shall have a stipend not exceeding one hundred pounds, nor exceeding the net annual value of the present profits and emoluments of the living. Where there is a glebe house, however, he shall be allowed to occupy it, on undertaking to keep it in repair; and where there is a glebe, the Commissioners, if they think proper, may allot to him, in addition to his salary, a portion of it not exceeding the annual value of twenty-five pounds.

Where there are any members of the Established Church in a parish, the living of which shall have been thus sequestered, in case there be in such parish no place of worship duly consecrated, it is enacted that the Ecclesiastical Commissioners shall apply a sum not exceeding a hundred pounds, or pay a rent not exceeding fifteen pounds, towards building or providing some place suitable for the celebration of divine worship therein. The bishop of the diocese in which the parish is situate shall always be associated with the Commissioners in determining upon the best mode of carrying the above objects into effect, and may vote upon all questions relating thereto as if he were a Commissioner. In cases where no curate is appointed, or where the curate does not desire to occupy the glebe-house, the Commissioners may demise or let it and the glebe lands for the period of the sequestration. All charges affecting suppressed benefices must be paid off by the Commissioners from the profits and emoluments of the living: and they may recover from any incumbent, or his executors or administrators, all such sums as his successor in the living would have had a claim for.

By clause 69th it is enacted, that if at any time the sequestration shall be removed, the Commissioner may recover from the person appointed to the living the whole, or such proportion as the Lord Lieutenant in council shall think fit to direct, of any sums paid or allowed by them in accounting with the last incumbent or his executors for dilapidations.

The next set of clauses relate to the separation of unions of parishes in each of which the members of the Established Church do not exceed fifty. It is provided that the Commissioners may, if they think proper, disunite such parishes on the next avoidance of the union, when each shall become subject to be dealt with in all respects as a single parish. And if it shall not appear expedient to the Commissioners to disunite the parishes, the Lord Lieutenant may order the income of the next incumbent to be reduced, in proportion to what shall appear to be the extent of duty to be performed. This enactment refers, as has been stated, only to united parishes in each of which there shall be no more than fifty members of the Established Church; but by clause 72 it is directed that in all cases in which any parish, or part of a parish, comprised in any union, is not contiguous to some other parish or part of a parish comprised in such union, such detached parish shall, upon the next vacancy in the living, be disunited from the rest. Some regulations follow in regard to cases arising out of these provisions. In future no union of parishes is to be made by any archbishop or bishop without one month's previous notice being given to the Commissioners.

The 76th clause enacts that, where no appointment may have been made to a parish, in consequence of the provision in the act of 3 and 4 Will. IV. c. 37, authorising the commissioners to suspend such appointment in consequence of divine worship not having been celebrated in the parish for a period of three years, if the parish is one containing not more than fifty members of the Established Church, the emoluments of the benefice shall not be applied to the purposes in the said act mentioned, but shall vest in the ecclesiastical Commissioners as sequestrators under this act.

By the 77th clause it is enacted that, in all cases in which the income enjoyed by the incumbent of any parish or union shall exceed 300*l.*, the commissioners on the next vacancy shall make inquiry into the case, and on their report the Lord Lieutenant may, if he shall think proper, reduce the income to any extent, so that it shall still not be below 300*l.*

In all the parishes coming under the operation of this act, it is declared by clause 28th, that it shall not be lawful to fill up any vacancy until the expiration of two calendar

months after notice in writing of such vacancy shall have been given to the Ecclesiastical Commissioners by the corporation or person having the patronage thereof. Private owners of advowsons, whose rights of presentation shall be taken away by the operation of the act, are to be compensated. If the sequestration shall at any time be removed, the advowson thus purchased shall vest in the crown.

The next clause, the 82nd, is that especially called the appropriation clause. It enacts that the Ecclesiastical Commissioners shall keep a separate account of all such sums or payments as shall accrue to them under the operation of the act, to be called the Reserve Fund; and that the monies so arising shall be applicable, in the first place, to the expenses attendant upon the revision of the memorials of persons applying for relief in respect of tithes due and unpaid for the last year; in the next place to the payment of such sums as shall, under the provisions of this act, become payable to such applicants; 'and, in the third place, to the payments of the stipends assigned under the hereinbefore contained provisions, to the curates or ministers entrusted with the cure of souls, or the performance of ecclesiastical duties; and to the provision of places of worship in parishes, the churches whereof may be sequestered under the provisions of this act; and to the payment of the charges and other sums payable under the herein-before contained provisions in respect of such parishes; and to the payment of the annual tax, and any other sums which would have been payable by the incumbents thereof, if the same had not been sequestered; and to the payment of any crown rents, post corn-rents, pensions and salaries to diocesan schoolmasters, or glebe rents, or proportion thereof, to be fixed and determined as herein-before provided; and to the payment of the expenses to be incurred in carrying this act into execution; and the residue of such monies from time to time accruing in each year to the credit of the said commissioners in the said Reserve Fund Account, shall be paid to such persons as the said Lord Lieutenant shall, by warrant under his hand, authorize to receive the same, to be applied to the moral and religious instruction of all classes of the people, without distinction of religious persuasion.'

In the meantime it is provided by the next clause that the Commissioners may borrow money on the credit of the Reserve Fund, for the purpose of indemnifying the owners of advowsons.

The 84th clause makes provision for the removal of the sequestration in parishes when their spiritual wants shall increase. It is enacted that when the arrangements made under the sequestration shall appear, in the judgment of the Commissioners, to be inadequate to such increased spiritual wants, they shall report the circumstances to the lord lieutenant, and make such propositions as to them shall seem expedient for applying a larger portion of the income of such parish or benefice for the better satisfaction of the spiritual wants thereof, or for the appointment of a clerk thereto; and if the lord lieutenant approve of the report, it shall be laid before both Houses of Parliament, and at any time after the expiration of six months thereafter, it shall be lawful for the lord lieutenant, unless Parliament shall otherwise direct, to order the same to be carried into effect.

By the 85th clause it is directed that the Commissioners shall annually report all their proceedings under the act to the lord lieutenant, with an account of all their receipts and disbursements.

The 86th clause enacts that the property of minor canons and vicars choral shall be vested in the Ecclesiastical Commissioners, subject to existing interests, and for the maintenance of such members of such corporations as have any duties to perform.

The 87th clause is explanatory of an unimportant point in the act 4 and 5 Will. IV. ch. 90, the Church Temporalities (Ireland) Act of the last session of Parliament. By some subsequent clauses it is enacted that tithes, &c. disappropriated from bishoprics and other dignities under that act may be carried to the general fund under the administration of the Ecclesiastical Commissioners, if the lord lieutenant shall so think fit; and that the tenants of Bishops, &c. may, instead of paying the purchase money for the fee simple of their lands, as provided for in the said act, give a mortgage upon the lands payable within ten years, with interest in the mean time at the rate of 3½ per cent.

By clauses 90 and 91 the Commissioners of land revenues and the Ecclesiastical Commissioners are empowered to examine on oath, or receive depositions, in any proceedings under this Act; and the Ecclesiastical Commissioners are permitted to employ additional clerks.

The 92nd clause authorizes the Commissioners of his Majesty's Treasury, in case it shall be found necessary, to advance to the Commissioners of the land revenues a sum of money on the credit of the rent-charges and other funds granted to the Commissioners by the Act, not exceeding the annual amount of the said funds; all sums thus advanced to be repaid with interest.

The 93rd and 94th clauses enact that the several tithe-composition Acts shall be taken to extend to tithes forming part of the hereditary revenues and possessions of the Crown in Ireland, and that all the provisions of the present Act shall also apply to compositions for tithes belonging to his Majesty.

The remaining clauses of the Act relate to the manner in which the several notices required to be given are to be served, to the exemption of all instruments required under the Act from stamp duty and office fees, to the punishment of forgery and perjury, to the limitation of actions, and to the interpretation of words used in the Act.

The present state of the Irish Church will be best exhibited by the following Tables, which we copy from a useful abstract of the First Report of the Commissioners of Ecclesiastical Inquiry, published by Mr. Hamilton, one of the Commissioners.

SOME NOTES ON THE TRADE OF THE LEVANT. TURKEY, GREECE, AND SYRIA.

The British and Frank merchants generally settled in Turkey have been for some time engaged in difficulties with the government, and alarmed by a reported change that the sultan contemplates in the tariff or scale of duties on foreign goods, which, as it now exists, is more liberal than the tariff of almost any other country in the world.

The actual difficulties arise out of the following circumstances:—By the existing commercial regulations—which have been very little altered in theory, though sometimes evaded in practice, during the last two hundred and more years—foreign goods, of whatever description, do not pay on an average more than an *ad valorem* duty of three per cent., and the Frank merchants importing them can expedite them inland from Constantinople, Salonica, Smyrna, or any other port, and sell them in any part of the country, without paying any additional duty or fee whatsoever. If however these goods are sold at the great ports or marts to Jewish, Arminian, Greek, or any other rayah or tributary subject of the Ottoman Porte, then such rayah, before he can carry them up the country, must pay an additional duty, which is nominally three per cent., but in fact generally six or nine per cent. Indeed, when the journey is long, or lies through the governments of powerful pashas, whose rapacity, whatever may be said to the contrary, has been as yet but little corrected by the reforms of the sultan, these second duties are frequently as high as twelve or fifteen per cent. Mr. Urquhart, who has written a clever book on Turkey and its resources, its municipal organization and *free trade*, and who is the best of the eulogists of the Turkish system and the extreme moderation of its import duties, has entirely overlooked this important fact, which certainly does not go to prove that the imposts on foreign trade are so *exceedingly* moderate, for whether the second duty be paid by the Jew or the Armenian, or by the European merchant, the effect is precisely the same, the weight of the duty falling equally on the goods, and checking, by an increase of price, their sale and consumption in the interior.

Now it happens, that except occasional transfers from Smyrna to Constantinople, Salonica, and one or two other ports, and *vice versa*, *from* those ports *to* Smyrna, the European importers universally sell their goods on the spots where they receive them, and *do not* expedite them on their own account to the interior, which they ought to do to claim the exemption from the second, or what we may call the inland duty. It is not necessary to detail the motives of convenience or security which prevent them. It is enough to say that they do not charge themselves with the interior trade, which, with the exception of some Turkish merchants, (who though exempted by the written law, are also made to pay something,) is entirely carried on by rayah subjects, by Jews, Armenians, and Greeks, who are all expressly liable to the second duty.

To obviate this last charge the parties interested have very frequently come to an understanding, and the Frank merchant, by declaring the goods sold by a *bonâ fide* sale not to be sold at all, but still his property, and carrying into the interior of the country on his account, has obtained from the Turkish customhouse a *teskeré* or permit, with which the goods pass without paying the second duty.

The chief blame of the folly and short-sightedness which render such expedients available, rests with the government, and we believe commercial morality seldom stickles at such stratagems and subterfuges when they can be adopted with success and impunity. Indeed, we know for a certainty, that for a very long series of years, the most respectable European houses in the Levant have covered their rayah buyers and adopted this process without scruple.

Increasing poverty, however, has now made even the Turks sharp-sighted; and a prying, clever, active *douanier en chef* at Smyrna—a certain Tahir Bey, who is now high in the sultan's favour, and at the head of the customs at Constantinople—detected the ancient imposition, and began to refuse the usual teskerés for the interior, save and except on certain conditions difficult to be complied with in most cases.

The more intelligent of the British merchants on the spot, knowing well, as we have said, that it matters not who pays the second duty, so long as it is paid, would readily propose to have the two legal duties put into one, or their tariff raised from three to six per cent., if they could rely on the Turks, or be sure that after receiving the interior duty from them, they would not continue to exact fresh duties on the same goods when carried up the country by Jewish, Armenian, or Greek traders. And we confess, that from their long residence and practical experience in the country, the doubts and opinions of these individuals are more entitled to consideration than the letter of the commercial law, which, like all their laws, the Turks continually set at defiance, or than the paid declamations of the French writer of Sultan Mahmoud's newspaper, (*Le Moniteur Ottoman,*) to whose assertions Mr. Urquhart, uninquiringly, gives the weight of incontrovertible evidence.

Since Tahir Bey's arrival at Constantinople he is said to have been constantly engaged in drawing up an entirely new tariff, the appearance of which, with a general and greatly increased scale of duties, the merchants are now daily expecting. As Sultan Mahmoud has few manufactures to protect, the duties will be raised merely for revenue, but if his exigences and wants are to be the only limits to the increase, it will be difficult to conjecture, when he once begins, where he will stop.

Our readers, who no doubt have heard a great deal about the sultan's reforms and abolitions of oppressive monopolies, will be surprised to be told that for some time past he has made the trade in opium—one of the most important exports of his empire—a close monopoly in the hands of the Seraskier Pasha and one or two other grandees of his court, who, for the better protection of their own interest, have procured a law prohibiting the shipping of opium at any other port than that of Constantinople. Formerly very large quantities of opium were shipped at Smyrna, particularly in American ships, which carried it to the market of China.

In the same manner, but for a longer time, the raw silks of Brusa and other parts of Asia Minor have been struck by an interdiction of free exportation, and can now (*legally*) find their way to the markets of Europe only by being deposited at, or passing through Constantinople, where they are charged with export duties that are farmed out to a few individuals. The folly of all this is so much the greater, as the production and the demand for this silk is naturally on the increase, and the trade in it, if left unshackled, and to itself, would materially add to the resources of the country. By the entire loss of her export trade in the valuable commodities of opium and silk, and through other circumstances affecting her imports, which we shall presently mention, the very ancient commercial city of Smyrna is declining into poverty and comparative insignificance. The costly caravans from the interior being driven out of their old route, and turned to Constantinople, Smyrna has little else to ship than figs and raisins, yellow-berries and valonia.

On the other hand, the enterprising Greeks of the islands who have established not merely agencies, but houses in England, France, and Italy, have possessed themselves of nearly all the trade which Smyrna formerly carried on with Salonica and all the upper part of the Levant; while lower down in the Mediterranean, since the conquest of Syria by Mehemet Ali, Beyrout has become a much frequented port, and not only supplies Syria, but a great part of the Turkish dominions (as Caramania) that lie between Beyrout and Smyrna. Our vessels and cargoes go direct to Beyrout, and, according to a recent list we have seen, more British ships had cleared out for the small Greek island of Syra than for that ancient emporium, Smyrna. A company of Greek islanders possess two fine steam-boats, and the merchants of the same nation give the best part of their employment to two English steamers which run from Smyrna.

The Greeks have, indeed, taken their bread out of the mouths of our commission merchants, or agents, settled at Smyrna, and other Scales of the Levant; but the Greeks, at the same time, have greatly increased the sale of British goods, and found out, or created, new markets for them. The injury is limited, or scarcely an injury at all—the benefit is very considerable, and increasing. Our agents must take to other trades—but whether they do or not, we cannot let our regret for merely personal, local, and temporary losses, blind us to the conviction that by those very losses the trade of this nation, *en masse*, will gain. But even before the Greeks were free, their talents and enterprise checked the prosperity of the Frank commission merchants, and we can confirm by our own observation

and experience the following remarks made by Colonel Leake, shortly after the breaking out of the Greek revolution:—

"Notwithstanding the superiority which the Frank merchant enjoyed over the Greek, in paying a single *ad valorem* duty of 3 per cent. on imports and exports, while the Rayah, besides being subject to illegal extortions, paid 5 per cent., in addition to repeated charges on moving his merchandise, the advantage which a native merchant always possesses in economy and local information, had gradually enabled the Greeks to drive the Frank merchants from the fairs of Greece, to obtain a great part of the internal maritime commerce of Turkey, and at length to share very largely in the exchange of the corn, oil, cotton, silk, and other produce of Greece, for the manufactured goods, and colonial produce, of the European nations. Even in the latter part of the last century, the foreign commerce of the Greeks had so much increased, that their competition was the principal cause of the decline of the European factories, which had long flourished in the principal Turkish marts; that competition having been greatly favoured, against the interests of the Frank resident merchants, by their own diplomatic agents, who largely exercised the privilege of granting protections to the Christian or Rayah subjects of Turkey, in virtue of which they enjoyed the same commercial privileges as the merchants of the protecting state. * * * * * The French Revolution had a further effect in promoting the commerce of the Greeks, and with it the extension of education and knowledge throughout the nation, by placing in their hands the greater part of the carrying trade of the Black Sea and the Mediterranean, which had formerly been enjoyed by the South of France and the Adriatic. For several years before the insurrection broke out, there were between four and five hundred Greek ships employed in the commerce of the Black Sea; at the same time that colleges, with professorships, in various branches of instruction, were established at Kydonies, Smyrna, Scio, Joannina, &c., &c."

Now, that their independence as a nation is acknowledged, the commercial position of the Greeks is wonderfully improved. They retain a good portion of the trade of the Black Sea—a portion which may be made greater than the whole trade was during the last war—they have nearly all the *cabotage*, or coasting trade, of the upper part of the Mediterranean—they frequent Sicily, and Italy, on both her seas—they have a considerable commerce with Marseilles—and, emerging from the Mediterranean and crossing the Atlantic, their flag is now frequently seen in America, in England, and in the northern and western ports of France. We have spoken of the agencies, or branch-houses, they have established. In Great Britain, alone, these new establishments are to be found in London, Manchester, Liverpool, and Glasgow—wherever they have settled the Greeks have been admired for their commercial abilities, their activity and enterprise, and the facility with which they acquire the language, and adapt themselves to the customs of the country. These men have contributed, in no trifling degree, to the improvement of the trade in Brusa silk, an article of which we now import from 1500 to 1800 bales annually, whereas, formerly—even when Smyrna was allowed to export it, and the trade in it was altogether less shackled by the Turks than it now is,—our whole importation seldom exceeded seven or eight hundred bales.

In losing her ill-treated Greek subjects, Turkey, commercially speaking, lost her right-hand. The Mussulmans, the Jews, and Armenians, have scarcely a notion of an extensive maritime trade, though the Armenians are excellent for land journeys and in-land trade, and also are now beginning to look to the formation of establishments in England. For many years before the Revolution, the Turks had been becoming more and more dependent upon the Greeks in the transaction of business of almost every kind.

We think it cannot be denied that hitherto, in spite of sundry irregularities and hindrances, the course of events has, on the whole, gone to verify the predictions of those who were most friendly to the Greeks, and who had the satisfaction, *at last*, of seeing them erected into a separate and independent nation. We will not be too sanguine:—we know the barbarity that reigns in a great part of the country, both insular and continental, and the insubordination, rapacity, and perfidy of some of the capitani or chieftains of the interior—we feel also, that a few false steps of a government, which is scarcely in any sense a national government, might derange everything; but still we may hope that their rapidly extending trade and intercourse with the best nations of the earth, will introduce civilization and prosperity, and that happy state of being where every man has something, or at least a fair and free market, for his labour, and thus becomes averse to violence and changes, and attached to social order. It was her maritime commerce, more than any other cause, that made ancient Greece what she was; and the Greeks have still the same enviable position with reference to Europe, Asia Minor, and the north of Africa,—they have still the same extent of sea-coast, and with the exception of a few, the same numerous islands and excellent harbours. The steam-engine must be one of the great instruments of their civilization. When steam-boats are pretty numerous (as they now promise to become,) piracy, which is very rarely heard of, must cease altogether, and the same vessels, so admirably adapted for a narrow sea with strong currents, long summer calms, or winds that blow one way for three or four months of the year, will rescue commerce from its long and expensive delays. It is a very common occurrence for a sailing vessel starting from the Greek island of Syra, during the Etesian winds, for Constantinople, to be two months on her voyage—nay, more, we have known a complete fleet of vessels, of nearly every flag, to be detained immovably for three months off the coast of Troy, utterly unable to make way against the fixed wind and the strong current of the Dardanelles. At the same season a good steamer would easily perform the voyage in three days.

We will now call our readers' attention to Damascus and the Syrian trade, concerning which we have derived some information from an unpretending, but exceedingly interesting, book of travels, written by Dr. Edward Hogg.* We have also looked into the recent volumes of Messrs. Michaud, Poujoulat, and De Lamartine. In the Companion for June, 1834, we mentioned, on the very best authority, that in consequence of the conquest of the country by Mehemet Ali, the wild fanaticism of the people of Damascus, who had been in the habit of furiously opposing the settlement of any Europeans among them, had been so far subdued, that a British Consul-General (Mr. Farren) had been sent out and received in a kind and honourable manner—that four British houses of trade had been established at Damascus, and three at Aleppo—and that British vessels, of from 120 to 250 tons each, had begun to go to Beyrout, (the most convenient Syrian port,) where none had been accustomed to go before. Since that time this new trade has been gradually improving; the antipathy towards Europeans, which was once held as invincible in the breasts of the Damascenes, has been greatly diminished, if not wholly removed, and Englishmen have trafficked with them and other Syrians on their own territory. Dr. Hogg was in Egypt at the time of Ibraham's campaign against the arms of the Sultan in Syria. In a conversation with the Viceroy Mehemet Ali, about his projected journey to Damascus, the Doctor was told that the inhabitants of that city had always been "barbarous, fanatic, and untractable,"—"but," continued Mehemet, "before the end of a year, if it remain in my possession, the English Consul, who has formerly been refused admission, shall be established in peace and security, and hats no longer be considered a rarity."

The word of Mehemet was well kept. Mr. Farren, whose approach alone to the town had been one of the causes of a sanguinary insurrection, was, as we have seen, "established in peace;" and hats became not only common at Damascus, but were as much respected as green turbans. When Monsieur Poujoulat entered the city, in the time of the Turks, the people cried out—"There goes a Frank consul, let us burn him;" but when Dr. Hogg and his friend and Christian attendants arrived, after the conquest of Syria by Ibrahim, they were received in the most quiet and orderly manner possible. It would, however, be excessively unfair to conclude, from this difference, that Sultan Mahmoud is a bigot,—he is no more a bigot than Mehemet Ali; and at Constantinople, and the

* Visit to Alexandria, Damascus, and Jerusalem, during the successful Campaign of Ibraham Pacha.—London, Saunders and Otley.

places where he can enforce his authority, Franks and Christians are no more liable to insult than they are in the dominions of the Pasha of Egypt: but in Syria his power had dwindled away to a shadow, and Mahmoud could not check or control the fanaticism of the people,—he was impotent for good as for evil; whereas, on the other side, Mehemet's power was fresh and most formidable, and he could coerce even popular fanaticism as he chose. In spite of the Sultan's good intentions, we should have remained excluded from Damascus, as we had been; but the iron rod of the Pasha has opened its gates to us, and time, and trade, and friendly intercourse may do the rest.

The Turks of Damascus admitted Dr. Hogg and his companion to see their manufactories, even after they had stated they had no intention of being purchasers. The native Christians of different communities were already enabled to keep their religious festivals in a public manner, to make processions, and to celebrate military victories and triumphs. Had they, a few months before, attempted only a tithe of what Dr. Hogg saw, they would have been cut to pieces by the furious Mahometans. The Doctor's attention was aroused by the shouts and acclamations of an exulting crowd.

"It consisted," he says, "of a large concourse of young men, who were parading, in triumphal procession, their own quarter of the town. Each was supplied with a stick, which he shouldered like a musket. An artificial camel, decorated with flowers and bells, preceded them; numerous small drums regulated their movements; and banners, composed of wreaths of foliage, a cross conspicuously decorated, and other emblems of liberation, waved in the air. Their countenances were highly animated, their shouts long and loud; nor was that of "buoni Franki" forgotten. Verses in praise of Ibrahim Pasha were enthusiastically sung. * * * We could not have had a more convincing proof of the impression produced by Ibrahim's liberal policy."

Dr. Hogg does not tell us what proportion these Eastern Christians bear to the Mahometan population; but, no doubt, as in all the great cities in Syria and Turkey, the proportion at Damascus, is very considerable. It is always exceedingly difficult to obtain statistical information in the East, and we are, therefore, not surprised to see the Doctor and the other travellers differing considerably as to the amount of the whole population of Damascus. It seems probable, however, that the city may contain from one hundred and fifty to one hundred and eighty thousand souls, and that the fertile and beautiful country which surrounds it to the distance of four or five miles on all sides, may make up a population of about half a million. Thus, in itself, Damascus is a market of some significance; but this is far from being all:—owing to circumstances of geography and devotion* she is a mart frequented annually by people from all parts of Syria, Arabia, and Asia Minor; she was an ancient depôt, and is still admirably provided with khans, warehouses, stabling for caravans, and all the other accommodations essential to land commerce in the East. Dr. Hogg says,

"From its central position, little more than forty miles from the sea, this town is admirably adapted to become the *entrepôt* of an extensive commerce between England and Asiatic Mahometan States. The annual resort of pilgrims offers a ready channel for conducting such a traffic; and were British capital and enterprize directed to this object, an important outlet might be established for many of our manufactures. As the sacred season approaches, the pilgrims collect in great numbers. All then is activity and movement. They arrive loaded with commodities,—remain several weeks,—make large purchases and exchanges,—and some idea may be formed of the consequence of this assemblage as a medium of commerce, from the circumstance of their camels alone amounting to thirty or forty thousand.

"The vicinity of Damascus yields silk of good quality and in great abundance. Cotton might be grown to any extent, and the coffee-tree is said to flourish luxuriantly, although its produce, hitherto, has never been turned to advantage. English earthenware, but of the commonest description, is already found here; and suitable articles in china and cut-glass, coloured crapes, certain kinds of cutlery, and the finer qualities of spun cotton, to supply native looms, might no doubt be successfully introduced. Other articles of British manufacture would also find a ready market, if the patterns, and taste of the different classes of natives, which never vary, were first ascertained."

If the Doctor had had more experience of the country people, and had looked at things with the eye of a merchant, he might have found several other articles demanded by the Damascus market. His remark, however, about the unvarying taste of the natives for certain patterns will be found worthy of the attention of such of our manufacturers of cotton, silk, or mixed goods as may be induced to try this new trade. For want of proper attention to this subject we have ourselves seen hundreds of bales of our fancy goods utterly sacrificed in Turkey in the course of a season or two. In the interior of Asia Minor as in Syria there is always a large demand for cheap cotton shawls for turbans, but the patterns of these shawls ought to be copied after those that have been in use in the country for ages, and ought to be varied according to the different districts for which they are intended; for in this last respect there is some variety, the Turk of *this* district not wearing the same patterned turban as the Turk in *that* district, and so on. With the exception of their designs, the small, cheap shawl-pieces manufactured at Glasgow seemed to us well adapted to the markets of Asia Minor.

Mr. Wyse, the present Member for Waterford, who travelled in the East some years ago, and who distinguished himself by the attention he paid to some of the commercial wants of the country, said in the course of his recent examination before the Committee on the Navigation of the Euphrates, &c.,

"Their turbans and shawls are composed of a mixture of silk and cotton; and wherever the Turks have come much in contact with English trade, they have almost universally adopted the English cotton turban in preference to the silk, which is considerably more expensive. The Arab turban and shawl are composed of a very coarse cotton and a mixture of yellow silk—the dresses, too, are of blue cotton. Under all circumstances, I think there would be a very considerable opportunity of introducing the cotton manufactures; and this has been further increased by the late wars which have taken place in the neighbourhood of Damascus and Mount Lebanon, from which much of the manufacture of silk in that part of the East was formerly supplied."

We are not aware that our manufacturers would be unable to produce the mixed cotton and silk goods at a cheaper rate than the natives, but whether this be the case or not, we think it would be worth their while to procure specimens of some of these articles which are made in the city of Brusa, at the foot of Mount Olympus. These samples would be a key to the prevailing taste in a large part of the East, and the beauty and variety of their patterns would, we suspect, astonish many of our countrymen. These patterns, we believe, are mostly invented, not by Turkish, but Armenian weavers; the stuffs are now in good part made of English cotton twist and Brusa silk, and they are used not for turbans or shawls, but for ladies' dresses.

Manchester, through its great outlet Liverpool, has begun to export manufactures to Beyrout and Damascus, and other articles have been sent to the same quarter. According to an account Dr. Hogg has received from Liverpool, our present trade with Syria stands thus:—Our usual exports for the Damascus market are cotton yarns or twists, muslins, white cottons, and, generally, manufactured cottons. No accurate estimate of the annual average amount of these exports could be formed, but the trade was daily increasing, and the exports of the present year would certainly exceed 200,000*l*. West Indian produce, as sugar and coffee, is exported to a moderate amount. All these exports are chiefly paid for in specie and Syrian produce. Our imports are silk, galls, madders, gums, opiums and sponges—raw-silk being imported from Damascus in considerable quantities. A few horses are also brought over for individual use.* The

* Damascus is the rendezvous of the greater part of the Musulman pilgrims,—it is accounted a "holy city" inferior in sanctity only to Mecca and Medina. Hence the fanaticism of the inhabitants. In former times the Pasha of Damascus was superior to all Pashas, and he was entrusted with the Sandjak-Scherif, or banner of Mahomet, under which the pilgrims marched every year from Damascus to Mecca. See D'Ohsson, Tableau Gen. de l'Empire Othoman.

annual amount of our imports cannot be ascertained, as the trade is quite new, but it is certainly rising.

The success of Captain Chesney's expedition, or the complete opening of the Euphrates to steam navigation, and the obtainment of a security for the passage from the predatory tribes of Arabs, would immensely increase the commercial importance of Damascus. But though this last case is hypothetical, there can be no doubt that as she now stands—with the position, and other advantages she is actually possessed of, Damascus may become a place of very great trade—*provided always* that Mehemet Ali does not grind his Syrian as he has done his other subjects, nor introduce his greedy, short-sighted monopolies, which are now a torment and a curse to Egypt. On this melancholy subject, Dr. Hogg, though on the whole favourably disposed to the Pasha, confirms some of the worst statements of preceding travellers, saying energetically—"*In Egypt all belongs to the government,—and the government is the Pasha;* the people are mere appendages to the soil—their labour and their lives equally subject to his arbitrary will. Like the Israelites of old, groaning under the burden, and smarting under the lash, their resources are unfeelingly diminished, and yet they are compelled to supply the insatiable demands of an inexorable task-master."

We shall conclude this subject, taking in some facts relative to Turkey, next month.

AMENDMENTS IN THE MUNICIPAL CORPORATIONS BILL.

The verbal amendments which have been made in the Corporation Reform Bill are numerous, but it is unnecessary to specify them minutely. The following are the material points in which the Bill, as it has come out of the Committee of the House of Commons, differs from the original draft.

In the fourth clause it is provided that the metes and bounds of those boroughs which are to be settled by the King in Council, are to be published in the 'London Gazette,' and thenceforward for the purposes of the Act to be the same as declared and published.

To the fifth clause, a special proviso has been added, that parts cut off from any borough, are to be declared part of the county adjoining: and that the senior justice of assize within the county, shall appoint a barrister to arbitrate between parties in any dispute that may thence arise respecting the payment of any rate made for the satisfying of any lawful debt to which the rate-payers of the borough or county were liable before the passing of the Act.

The sixth clause (the enfranchising clause) has been verbally reconstructed, but remains substantially the same.

The seventh clause is an insertion, and enacts that "no medical or surgical assistance given by the charitable trustees of any borough, shall be taken to be such charitable allowance as shall disqualify any person from being enrolled a burgess, nor shall any person be so disqualified by reason that any child of such person shall have been admitted and taught within any public or endowed school, governed by such charitable trustees."

To the eighth (seventh) clause, the following is added, "That during the first three years next, after the passing of this Act, every such occupier who shall have claimed to be put on every rate made for the relief of the poor, since the passing of this Act, in respect of such premises occupied by him, and who, on or before the last day of August, in any of the said three years, shall have actually paid or tendered the full amount of all such rates, due in respect of such premises, and who shall have been an inhabitant householder within the borough, or within seven miles of the borough, during the year in which he shall so claim, and the whole of the two preceding years, shall be entitled to be enrolled a burgess of such borough, in such year, provided he shall then be otherwise qualified."

The ninth clause is an insertion, and runs as follows:—"That where any house, warehouse, counting-house, or shop, in any borough, shall come to any person by descent, succession, marriage, marriage-settlement, devise or promotion to any benefice or office, such person shall be entitled to reckon the occupancy, and rating in respect of the occupancy thereof, by the person from, by, or in succession to whom such house, warehouse, counting-house, or shop, shall have so come to him as his own occupancy and rating, and shall be entitled to be enrolled a burgess in respect of such occupancy and rating at such time, and in such manner as if he had occupied, and had been rated for the same during the time of the occupancy and rating of the person, from, by, or in succession to, whom such house, warehouse, counting-house, or shop, shall have so come to him, conjointly with the time during which he shall have since occupied and been rated for the same, provided he shall be otherwise qualified, as herein provided."

The tenth (eighth) clause directs that burgesses who have been enrolled, and have been *omitted* from the roll, may be restored within two years, if, on their application to be restored, they are *bonâ fide* occupiers and inhabitant householders within the borough, or within seven miles of the borough.

The twelfth (tenth) clause, which makes a reservation of certain rights of common, &c., and exemption from tolls, contains additional provisos, requiring persons whose rights are reserved to pay any fine, fee, or sum of money which they would have been entitled to pay in consideration of their freedom or title; and the mayors of boroughs are directed to make out, on or before the 25th of October in the present year, lists of all persons whose rights are reserved, to be delivered to the councils of the boroughs, and no person whose name is not included in such list shall receive any benefit or share of such reserved rights.

The thirteenth clause is an insertion, empowering the borough councils to purchase those rights of common, &c., and exemption from tolls, which are reserved by the preceding clause, and giving directions as to the mode in which the purchase may be made.

In clause fifteen (twelve) the day in every year on which the overseers of the poor of the parish are to make out lists of persons entitled to be enrolled as burgesses is altered from the last day of August to the fifth of September; and the overseers are required to furnish a copy of such list to any person demanding the same, on payment of a reasonable price for each copy.

The seventeenth (fourteenth) clause directs that the two assessors, afterwards mentioned, are, along with the mayor, to hold the courts for revising the lists.

The nineteenth clause is an insertion, permitting persons authorized by law to make an affirmation instead of an oath, in all cases under the Act in which an oath is required.

The thirty-third clause is an insertion, directing that on the 1st of March in every year two auditors and two assessors are to be chosen for each borough. This is in lieu of clause 80 in the original form of the Bill, by which three auditors were to be chosen. The assessors are joined with the mayor in presiding over elections, &c.

The thirty-fifth (thirtieth) clause, which directed certain boroughs to be divided into wards, enacts, "That if, by the last, or upon the taking of any future account of the population of Great Britain by authority of Parliament, it shall appear that the population of any borough within the limits to be assigned to such borough under the provisions of this Act, shall exceed the number of twelve thousand persons, and in case his Majesty shall be pleased to issue his letters-patent under the Great Seal, that he may be certified whether, and in what manner such division into wards ought to be made or altered, and upon inspection of the return thereunto made by the Commissioners to whom such letters-patent, as last aforesaid, shall have been directed, shall be pleased, by the advice of his Privy Council, to declare that such borough shall be divided or re-divided into wards, and to declare the number and extent of such wards, and the number of councillors who shall be chosen in each of such wards, in manner following: (that is to say), if the population of such borough shall then appear to exceed twelve thousand persons, and not to exceed eighteen thousand persons, that such borough shall be divided into two wards, and the number of councillors to be chosen in each ward shall be any number, so that the whole number of councillors of such borough shall not be less than twenty-four persons, and not more than thirty persons; and if the population of such borough shall then appear to exceed eighteen thousand persons, and not to exceed twenty-four thousand persons, that such

borough shall be divided into any number of wards not more than four, and that the number of councillors to be chosen in each ward shall be any number, so that the whole number of councillors shall not be less than thirty persons, and not more than thirty-six persons; and if the population of such borough shall then appear to exceed twenty-four thousand persons, that such borough shall be divided into so many wards, not less than four, as to his Majesty shall seem fit, and that the number of councillors to be chosen in each ward shall not be less than six; and if his Majesty shall be pleased to cause the particulars of such division or re-division into wards, and the number of councillors assigned to each ward in such borough, to be published by Royal Proclamation in the "London Gazette," every such borough shall thenceforward be deemed to be divided into such and so many wards as shall have been so last declared and published as aforesaid; and thenceforward there shall be elected two assessors for every such ward,—provided, nevertheless, that no such re-division shall be made in any borough after the first division into wards aforesaid, unless upon the petition to his Majesty by the council of such borough."

The thirty-sixth (thirty-first) clause, relating to the election of councillors and assessors in wards by the burgesses of the wards, provides, that "in every case in which there shall be a division or re-division into wards of any borough, after the first election of councillors in such borough under the provisions of this Act, the whole council of the borough, and the assessors of the borough, and of all the wards of the borough, on the twenty-fifth day of October next after such division or re-division, shall go out of office."

The forty-first clause is an insertion, and inflicts a penalty on any mayor, alderman, or assessor of any borough, who shall neglect to comply with the provisions of the Act, in the revision of the burgess-roll or conduct of elections; and on overseers of the poor and town-clerks failing or neglecting to make out, receive, print, and publish the lists of persons entitled to be on the burgess-roll.

In clause forty-seven (forty-one) the mayor is declared to be a justice of the peace for the borough merely, instead of for county and borough.

Clause fifty-five (forty-nine) gives particular directions respecting the claiming and granting of compensation to such officers of boroughs as shall be in any office of profit at the time of the first election of councillors under the Act. Clause fifty-six is an insertion, and directs compensation to be secured by bond, under the common seal of the borough; and clause fifty-seven makes a reservation of certain pensions and allowances.

Clause sixty-three (fifty-six) directs that the number of charitable trustees to be appointed is to be not less than nine, instead of fifteen; the time of annual elections is altered from first November to first of January; and one-third part of the number of trustees is to retire annually.

Clause seventy (sixty-three) contains verbal alterations on the clause appointing a certain number of councillors to be joint trustees for certain purposes; and seventy-one (*insertion*), directs present trustees of certain Acts to be continued for a definite time; and trustees not to go out of office by reason of ceasing to be of the council, until the time prescribed by the terms of the trust.

The eighty-seventh (seventy-ninth) clause contains more specific directions for the application of the borough fund, and provides that if any surplus exist after all claims are satisfied, the borough council may direct it to be applied for the public benefit of the inhabitants, or improvement of the borough. In certain cases a watch-rate may be levied.

By the ninety-fourth clause, the recorder is declared to be a justice of the peace for the borough, though he may not have the qualification required in the case of any other person being a justice of the peace for a county: he is not eligible to be elected as member of the House of Commons for the borough.

By clause one hundred and four (ninety-seven) disputes arising out of the payment of proportions of the county rates are to be decided by the arbitration of a barrister (as in 5 Geo. IV., c. 58), instead of the parties being allowed to appeal to the Privy Council.

By clause one hundred and twenty-one (one hundred and fourteen) notices of petitions to king in council for charters of incorporation are to be published in the 'London Gazette,' one month previous to being considered.

PARLIAMENTARY ABSTRACTS.

LORD BROUGHAM'S RESOLUTIONS ON EDUCATION.

1. That although the number of schools, where some of the elementary branches of education are taught, has greatly increased within the last twenty years, yet that there still exists a deficiency of such schools, especially in the metropolis and other great towns, and that the means of elementary instruction are peculiarly deficient in the counties of Middlesex and Lancaster.

2. That the kind of education given at the greater number of the schools now established for the poorer classes of the people is of a kind by no means sufficient for their instruction, being for the most part confined to reading, writing, and a little arithmetic; whereas, at no greater expense, and in the same time, the children might easily be instructed in the elements of the more useful branches of knowledge, and thereby trained to sober, industrious, prudent, and virtuous habits.

3. That the number of infant schools is still exceedingly deficient, and especially in those great towns where they are most wanted for improving the morals of the people and preventing the commission of crimes.

4. That while it is expedient to do nothing which may relax the efforts of private beneficence in forming and supporting schools, or which may discourage the poorer classes of the people from contributing to the cost of educating their children, it is incumbent upon Parliament to aid in providing the effectual means of instruction where these cannot otherwise be obtained for the people.

5. That it is incumbent upon Parliament to encourage in like manner the establishment of infant schools, especially in the larger towns.

6. That, for the purpose of improving the kind of education given at schools for the people at large, it is expedient to establish, in several parts of the country, seminaries where good schoolmasters may be trained and taught the duties of their profession.

7. That there are at present existing, in different parts of the United Kingdom, funds, as well real as personal, to a large amount, given or bequeathed to charitable uses, connected with education, but which, partly from want of objects in the particular places to which such gifts are confined, partly from want of proper powers in the trustees, partly from other defects in the foundations, and partly from a change in the habits of the people, have become in many instances unavailing to the purposes for which they were originally intended, and are now productive of very inadequate benefit to the country; while, from want of publicity, abuses frequently creep into the management of them, only to be remedied by tedious and expensive litigation.

8. That, in order to superintend the due and just application of the funds from time to time voted by Parliament for the promotion of education, to establish proper seminaries for training teachers, to encourage the trustees of charities connected with education in using beneficially the powers now possessed by them, to watch over the abuses of trusts committed by such trustees, and to control the exercise of such new powers as Parliament may grant them, it is expedient that a board of commissioners be appointed, with powers and duties to be regulated by Act of Parliament.

9. That it is further expedient to give such board a power of filling up the number of trustees when these have fallen below the quorum in any will or deed of foundation, subject to the approval of the special visitor, where there is one; and to authorize, subject to the like approval, the sale, the mortgage, or exchange of any property given to charitable uses connected with education, for the promotion of the objects of the foundation, as far as these may be deemed beneficial to the community.

10. That it be further expedient to give such board a power, subject as aforesaid, of directing the trustees of any grammar-school, where the funds are sufficient, to apply such part thereof as may not be wanted for teaching grammar, in providing the means of common and improved education for the people at large.

11. That it is further expedient to give such board a power, subject as aforesaid, with consent of the trustees, and subject to appeal in Parliament, to apply a portion of the funds intrusted to them in such manner as to produce a more general benefit, and at a cheaper rate, in the education of the people at large, where the particular employment of the funds directed by the founder has become difficult from want of objects, or prejudicial from the employment pointed out being no longer beneficial to the community.

12. That it is further expedient to give such board the power, in conjunction with the trustees, of imposing conditions upon the masters of endowed schools, in respect of taking boarders, and otherwise conducting themselves; and of removing them, with consent of the trustees, in case of breach of such conditions.

13. That it is further expedient to give such board the power of calling, from time to time, for accounts of the management of endowed schools, both from the trustees and from the teachers.

14. That it is expedient to require all trustees of charities connected with education to deliver, yearly, to his Majesty's principal Secretary of State, an account of all sums of money received and expended by them in the execution of their trust.

THE REVENUE. *No. I.*—An ABSTRACT of the NET PRODUCE of the REVENUE of GREAT BRITAIN, in the Years and Quarters ended 5th July, 1834, and 5th July, 1835, showing the Increase or Decrease under each Head thereof.

TRADE, STATISTICS, &c.

Statistics, Revenues, Debt, Trade, and Resources of the Republic of Venezuela.

This state comprises the whole of the north-eastern part of the late republic of Columbia as it existed prior to the separation in 1831. The present territory of Venezuela extends from the Equator as far north as Cape San Roman in 12° north lat., and from 60° to 71° 30′ west long., occupying altogether a line of coast about 900 miles in length, from the mouth of the River Orinoco to the entrance of the Gulph of Maracaibo. It includes also the Island of Margarita.

The sea-coast is divided from the plains by a chain of the Andes, which runs right through the country. The climate on

the sea-coast and in the plain is hot and unhealthy, but on the table land and in the valleys the air is pure and mild. The soil is generally everywhere fertile, the table land yielding most of the fruits and vegetables of Europe, while the plains afford pasture for numerous herds of cattle.

Venezuela is divided into four departments, containing thirteen provinces, with a population altogether of about 840,000 inhabitants, viz.:—

1. Department of Venezuela, capital, Caraccas; containing the provinces of Caraccas, with 260,000 inhabitants; Carabobo, 170,000.

2. Department of Cumana, capital, Cumana; containing the provinces of Cumana, with 70,000 inhabitants; Barcelona, 44,000; Island of Margarita, 15,000.

3. Department of the Orinoco, capital, Varinas; containing the provinces of Varinas, with 80,000 inhabitants; Apure, 55,000; Guayana, 45,000.

4. Department of Tulia, capital, Maracaibo; containing the provinces of Maracaibo, with 40,000 inhabitants; Coro, 30,000; Merida, 50,000; Truxillo, 34,000.

The chief rivers are the Orinoco and its various branches, the Apure, Meta, &c.

The principal sea ports are those of Maracaibo, Puerto Cabello, La Guayra, and San Thomas; the latter is situated about 250 miles up the River Orinoco.

The average revenues of Venezuela, for the last two years, have amounted to about 1,290,000 dollars, (or 258,000*l.*,) and the expenditure to 1,375,000 dollars, (or 275,000*l.*,) leaving an apparent excess of expenditure over income of about 17,000*l.* sterling a year, against which, however, there is to be placed a fund belonging to the Treasury of 50,000*l.* sterling, which is employed in the tobacco monopoly.

The expenses for the present year, ending July next, have been estimated at 1,315,000 dollars, without however making any provision whatever for the interest due on the foreign debt.

The principal sources of the revenues of Venezuela are the duties on imports and exports; the former last year returned about 950,000 dollars, and the latter 200,000. The tobacco rents in 1833 produced about 115,000 dollars, but the monopoly has since then been given up, and tobacco may now be imported upon payment of a duty. The next branch of taxation is salt, which produces about 56,000 dollars a year; the remainder of the revenues is derived from rents, stamps, post-office, and other minor branches, yielding altogether about 150,000 dollars, and making a gross total of 1,750,000 dollars a year, the expenses of collecting which amount to about 450,000 dollars.

The portion of the foreign debt of the late Republic of Columbia, due by Venezuela, is about 1,900,000*l.* sterling, whilst the arrears of interest accumulated on this sum, up to the close of last year, amount to about 950,000*l.* more, making altogether a total of 2,850,000*l.*, the interest on which, at six per cent., would be upwards of 170,000*l.* a year.

The domestic debt of Venezuela, up to the close of July, 1834, was reduced to somewhere about one million of dollars, the government having annually appropriated a certain portion of their surplus revenue towards its extinction.

The staple articles of export from Venezuela are cocoa, coffee, cotton, indigo, dyewoods, and a few drugs. Venezuela does not produce either gold or silver, but there are some rich copper mines near Puerto Cabello, now working by the Bolivar Mining Company, which have latterly produced about 3000 tons of copper ore every year.

The value of the produce exported from Venezuela during the year ending July, 1833, amounted to about three millions of dollars, (or 600,000*l.*,) and that of goods imported to 3,100,000 dollars, (or 620,000*l.*,) including however about 80,000*l.* sterling in specie. The duties paid at the different custom-houses during the same period amounted to about 1,150,000 dollars (or 230,000*l.*)

Cocoa.—This article formed the staple produce of Venezuela, under the dominion of Spain; the annual exports to the mother country alone being not less than 7¼ millions of pounds weight. Of late years, however, the demand for this article has materially fallen off in Spain; and the owners of cocoa plantations in Venezuela have, in many parts, directed their attention to other branches of agriculture, particularly to the cultivation of the coffee plant. The total exports of cocoa from Venezuela in 1833, amounted to about 5¼ millions of pounds weight. The present price of this article in La Guayra is from fourteen to fifteen dollars per 100 lbs.

Coffee.—The cultivation of the coffee plant has greatly increased within these few last years in Venezuela, particularly in the valleys and on the sides of the hills. The exports from La Guayra 1833, were about 12 millions of lbs. weight being nearly double the quantity exported in 1830. The price of coffee is about ten dollars the 100 lbs., which is still too high to enable the article to enter into competition with the produce of Brazil or Cuba. Caracca coffee ranks in our market with good ordinary St. Domingo.

Cotton.—The cultivation of cotton has not increased in the same proportion as that of coffee, the soil not being so congenial to this plant as that of New Grenada, although the quality produced is somewhat superior. The exports in 1833 amounted to about 200,000 lbs., and the article sells at about eight dollars per 100 lbs.

Indigo.—The consumption of Caraccas indigo has been greatly interfered with by the preference given in Europe to strong East India indigo, which is both better and cheaper; and the cultivation of this plant has in consequence been neglected in Venezuela; some new plantations have however lately commenced in the plain of Varinas. The quantity produced in 1833 amounted to about 325,000 lbs. weight. The article sells from three quarters to one dollar per lb.

Tobacco.—During the government monopoly the cultivation of this article was restricted to particular districts, and not one-third of the tobacco consumed in the country was supplied from its own growth, the greater part being smuggled from the Brazils and other parts, while the enormous expense of administration absorbed almost all the profits on the monopoly. The Venezuelian government have now been convinced of the impolicy of this system, and the monopoly was in consequence given up in 1833. The best tobacco produced in Venezuela is that grown in the valley of Cumanaçoa, which is considered superior to the Varinas, and ranks next to that of Cuba. The Dutch were formerly the principal consumers of Varinas tobacco, but the price of the article having so much increased, owing to the falling off of the produce, other tobaccos are now used in Holland as a substitute. The exportation of tobacco in 1833 was 386,000 lbs., value about 6*d.* per lb.; but as Venezuela will be obliged to import tobacco for its own use, the article is not likely to be an important article of export for some time to come at least.

Particulars of the expenditure of Venezuela for the year ending July, 1835:—

Finances:—Official department			D.32,000
„ Custom-houses, tobacco, &c.			84,500

Cattle	1,700 head	22,000
Mules	580 head	37,000
	Carried over	D.2,640,000

able and Learned Member withdrew the resolution for the present. The first three clauses of the Bill were then agreed to by the Committee. When the 4th came to be considered, Lord Dudley Stuart moved that, instead of the King in Council being empowered to determine the future boundaries of boroughs, the existing boundaries should remain until they should be otherwise settled by Act of Parliament; but the amendment was lost on a division by a majority of 279 to 192. The 5th clause having been then agreed to, Lord John Russell proposed, that the terms of the 6th should be so altered as to make it necessary, that every voter should have occupied premises in the borough for at least two years and ten months before the revision of the burgess-roll. Mr. Divett then moved, as an amendment, that twelve months' residence and rating should be a sufficient qualification; but the motion was negatived on a division, by a majority of 321 to 97. Another amendment, proposed by Mr. Jervis, the object of which was to give the right of voting to persons carrying on business in the borough, even if they did not reside within seven miles of it, was, after a short conversation, withdrawn.

On Tuesday the 23rd, the House went again into Committee on the Bill, when the 6th, 7th, and 8th clauses were agreed to. On the 9th, an amendment was moved by Sir William Follett, to the effect, that, without interfering with the municipal government of corporate boroughs, all the rights, privileges, and properties of freemen for other purposes should be preserved. After the debate, however, had proceeded for some time, the Honourable and Learned Member, with the permission of the Committee, altered his motion to the following form:—"That the rights which were preserved by the Reform Bill to the freemen, and persons who should hereafter be entitled by birth and servitude to be freemen, should be continued." The discussion was then continued at great length; and when the Committee divided at its close, there appeared for the amendment 232, against it 278. Mr. Trevor afterwards moved that the clause should be expunged altogether; but this amendment was not pressed to a division.

On Wednesday the 24th, in the House of Lords, the Highways Bill was, on the motion of the Duke of Richmond, after it had been read a second time, referred to a Select Committee. A resolution was then passed unanimously, expressive of the sense entertained by the House of the able and zealous services of the Earl of Devon (lately Mr. Courtenay) during the time he had acted as Clerk-Assistant. The Prison Regulation Bill was afterwards read a second time, and referred to a Select Committee.

In the Commons, the early part of the evening was occupied in the discussion of a motion brought forward by Lord Mahon, for copies of the late Order in Council, exempting persons who may enter the service of the Queen of Spain, from the provisions of the Foreign Enlistment Act, and also of all communications on that subject which may have passed between his Majesty's Ministers and the Minister at this Court of the Queen of Spain. The motion was withdrawn after a debate of some length, but of little interest except what arose from a personal altercation between the Noble Lord and Colonel Evans, which however was at length amicably arranged by the interference of the Speaker and the House. The House then went again into Committee on the Municipal Corporations Bill, when the 10th clause gave rise to a long discussion. It was, however, eventually agreed to with the modification proposed by Ministers, preserving the rights of property acquired by inhabitancy, and to be acquired by persons under indenture of apprenticeship.

On Thursday the 25th, discussions of considerable warmth took place in the House of Lords, first, on the subject of the introduction of a system of poor-laws into Ireland, and, next, on certain charges brought by the Bishop of Exeter against the Commissioners both of Public Instruction, and of Inquiry into the Irish Church; but there was no business, properly so called, before the House.

In the House of Commons the principal subject of discussion was the motion of Mr. Wakley, for the pardon and recall of the Dorchester labourers convicted of illegal combination in 1833. On a division the motion was negatived by a majority of 308 to 82. Before the debate commenced, however, Lord John Russell intimated that he had thought it his duty to recommend to the Crown that all the six convicts should be pardoned on condition that they remained in the colony, and that four of them should be allowed to return home at the end of two years from the time of their arrival in the colony, provided the governor should have approved of their conduct during that period. Mr. Fox Maule afterwards moved for leave to bring in a Bill for relief of the tenants and occupiers of land in Scotland from the damage done to their crops by hares, pheasants, and rabbits; but, after a short debate, the motion was negatived by a majority of 76 to 50.

On Friday, the 26th, a discussion which had been commenced the preceding evening was renewed, on the subject of certain of the parties implicated in the affair of the late Ipswich election. Mr. P. M. Stewart having moved that Mr. Dasent should be brought to the bar, reprimanded, and discharged, the motion was carried after a debate of considerable length by a majority of 190 to 141. It was afterwards agreed, on the motion of Mr. Hawes, that the case of Pilgrim should be disposed of in the same manner. Lord Morpeth then moved for leave to bring in his Bill for the better regulation of ecclesiastical revenues and the promotion of religious and moral instruction in Ireland, and explained its provisions at considerable length. We have given an account of this important measure in another place. Leave was given to bring in the Bill, but Sir Henry Hardinge, Mr. Shaw, Sir Robert Peel, and Lord Stanley, all declared their decided opposition to its principle.

Both Houses met again on Monday, the 29th, but the little business done in the Lords was scarcely of any public importance. In the Commons, Lord John Russell intimated that it was the intention of Government to introduce, early next Session, both a Bill upon the subject of church rates, and another for the establishment of a general registration of such a nature as to leave but little difficulty afterwards in bringing forward a measure with respect to Dissenters' marriages. A discussion then took place in regard to the case of Mr. O'Malley, one of the persons confined by order of the House for his conduct in the affair of the Ipswich election. Mr. Devonshire Jackson having presented a certificate from Mr. Bransby Cooper, the surgeon, stating that Mr. O'Malley's health would be injured by a prolongation of his imprisonment, moved that he should be discharged after being reprimanded at the Bar; but it was eventually agreed that nothing should be done in the matter till Mr. Cooper had been examined by the House. Mr. Rigby Wason then moved that the Norwich magistrates, Messrs. Bignold and Booth, should be committed to the custody of the Serjeant-at-Arms for their breach of the privileges of the House in the matter of the Ipswich election; but an amendment proposed by Mr. P. M. Stewart, that they should be ordered to attend at the Bar of the House on the following Saturday, was agreed to after a short discussion. A debate then arose on a motion brought forward by Mr. Praed, for copies of any communications which had passed between the Board of Commissioners for the Affairs of India and the Court of Directors of the East India Company on the subject of the revocation of the appointment of Lord Heytesbury as Governor-General. The motion was eventually negatived by a majority of 254 to 179. The House then resolved itself into a Committee on the Corporations Bill, when the 11th, 12th, and 13th clauses were agreed to without any material alteration. The Roman Catholic Marriages (Ireland) Bill was afterwards read a third time, and passed.

On Tuesday the 30th, in the House of Lords, Lord Brougham withdrew his resolutions on the subject of national education, for the purpose of embodying the substance of them in a Bill, at the suggestion of Lord Melbourne, who expressed his entire accordance in their general tenour, though he objected to pledge himself, by voting for them in the shape of resolutions, to everything they contained.

In the Commons, Mr. Bransby Cooper was examined at the bar in regard to the state of health of Mr. O'Malley, but his evidence was considered by the House so unsatisfactory, that it was resolved to proceed no further in the matter till the testimony of some other of Mr. O'Malley's medical attendants should be obtained. Messrs. Bond, Cooke, and Clamp, all confined on account of their participation in the transactions at Ipswich, were then repri-

manded and ordered to be discharged on payment of their fees. After this a motion, made by Mr. Gisborne, that the Attorney-General should be directed to prosecute all persons who appeared from the evidence taken by the Ipswich Election Committee to have been guilty of bribery, was unanimously agreed to. This business having been disposed of, the House, having gone into Committee, resumed the consideration of the Corporation Reform Bill, when Lord John Russell having proposed to modify the 14th clause, by providing that two of the three auditors of accounts should be associated with the mayor in revising the burgess-roll, but that for the first year the revising-barristers should be the revisers, Mr. Wynn moved, as an amendment, that the revision should continue to be performed by the revising-barristers. After some discussion this amendment was negatived by a majority of 86 to 53. The four immediately following clauses were then agreed to, as was also clause 19th, after an amendment proposed by Mr. Borthwick, to the effect, that the existing members of corporations should be made councillors for life, had been withdrawn. A long debate then arose on an amendment to clause 20th proposed by Sir Robert Peel, the object of which was to provide, that every member of council at the time of his election should be possessed of real or personal property to the clear value of 1000*l.*, or be rated on a rental of not less than 40*l.* a-year. Eventually this amendment also was negatived, the ayes being 204, and the noes 267.* The 21st clause having been then agreed to, Lord Stanley moved to amend the 22nd, by making it enact that one-third of the council should go out every two years instead of annually; but this amendment was also lost, the numbers on a division being 176 for, and 220 against it.

On Wednesday the 1st of July, in the Lords, various Bills were advanced a stage, and some remarks of the Duke of Richmond gave rise to a short conversation respecting the present practice of removing cases from the quarter-sessions by *certiorari*, into the Court of King's Bench, the law with respect to which it appeared to be generally admitted by their Lordships stood in need of amendment.

In the House of Commons, the minutes of evidence taken on the Wolverhampton inquiry were brought up by Lord John Russell, and ordered to be printed. His lordship, in reply to some observations by Sir Henry Hardinge, said it was his decided opinion that the conduct of the military at Wolverhampton was marked by the most commendable forbearance and the most correct judgment. Dr. Farr, one of Mr. O'Malley's medical attendants, having been then, on the motion of Mr. Jackson, called to the bar and examined on the state of that gentleman's health, and having given it as his opinion that his life would be endangered if he were much longer confined, Mr. O'Malley was in consequence, after receiving a reprimand from the Speaker, ordered to be discharged from custody. The order for the resumption of the debate adjourned from the 11th of the preceding month,* on the grant moved for by Sir William Rae, for increased church accommodation in Scotland, having been then read, it was after a short discussion resolved, on the motion of Lord John Russell, that an Address should be presented, praying his Majesty to appoint a commission to inquire, generally, into the opportunities of religious worship, and the means of religious instruction, and the pastoral superintendence afforded to the people of Scotland, and into what funds are, or may hereafter be, available for the purposes of the Established Church. The House then went into Committee on the Municipal Corporations Bill, when, with the exception of clause 30, relating to the division of the larger boroughs into wards, the consideration of which was postponed, the clauses up to the 36th inclusive, were agreed to, with only a few verbal amendments.

In the House of Lords, on Thursday the 2nd, conversations arose, first, on the subject of Spanish affairs, in consequence of some remarks made by Lord Londonderry respecting the recent proclamation of Don Carlos, declaring that all strangers taken in arms should be shot,—a proclamation which, if genuine, Lord Melbourne declared should not prevent the English recruits now going out from having the benefit of Lord Eliot's convention; and then on the charges brought by the Bishop of Exeter on a former evening against the Commissioners of Public Instruction in Ireland: a letter in defence of his conduct from one of whom, Mr. M'Dermott, who had been the principal object of the Bishop's attack, was read by Lord Duncannon. A Bill was afterwards introduced by the Archbishop of Canterbury, for protecting the revenues of vacant ecclesiastical benefices without cure of souls; and another by Lord Denman, for amending the law respecting the removal of indictments into the Court of King's Bench by *certiorari*, in conformity with the suggestions thrown out at the previous sitting.

In the Commons the principal business was again the Municipal Corporation Bill, several more of the clauses of which were discussed in Committee. To the 42nd clause, which makes the town-clerk removable by the council at the expiration of every year, Lord Stanley moved as an amendment, that the officer in question should retain his office during good behaviour; but after a debate distinguished by considerable personality and warmth, the motion was negatived by a majority of 125 to 65. An amendment to the 52nd clause, proposed by Sir James Graham, with the object of continuing the power of licensing alehouses in the hands of the magistrates, afterwards met with a similar fate, the numbers, on a division, being 166 for, and 211 against it. The other clauses, up to the 55th inclusive, were agreed to. Two Bills introduced by Mr. Hume, were afterwards read a first time; the one to repeal so much of the Act 25 Geo. II., as restrains the amusements of music and dancing; the other to diminish the expenses of elections.

On Friday the 3rd, in the House of Lords, Lord Brougham brought in his Bill on the subject of National Education, which was read a first time. Some conversation afterwards took place on Spanish and Irish affairs.

In the Commons an interesting conversation arose on the presentment by Mr. H. Bulwer of a petition from 6000 free inhabitants of New South Wales, praying for the establishment of a representative legislature in that colony. Sir George Grey stated that Ministers were strongly desirous to give to New South Wales the advantages of civil institutions. The order for calling Messrs. Bignold and Booth to the Bar of the House having been discharged, a Select Committee to consider their conduct was then appointed on the motion of Lord John Russell. After this, the House went into Committee on the Corporation Reform Bill, when the clauses up to the 94th inclusive (with the exception of the 79th, which was postponed), were agreed to, with but little discussion. The Linen Trade (Ireland) Bill, afterwards went through Committee, and the Aberdeen Universities Bill was read a second time. This latter measure has been since withdrawn.

On Monday, the 6th, the House having again resolved itself into Committee, all the remaining clauses of the Corporation Reform Bill, together with the 10th, the 30th, and the 79th, were successively agreed to without a division. The 10th clause, however, on the motion of Lord John Russell, was altered so as to provide that all boroughs in which the population amounts to 18,000 shall be divided into two wards, those with a population amounting to 24,000 into three, and those with a population exceeding 24,000 into as many as the King shall appoint.

On Tuesday, the 7th, it was agreed in the Lords, on the motion of Lord Lansdowne, that an Address should be presented, praying his Majesty to direct the erection of a temporary building for their Lordships' convenience in the next Session of Parliament. It was also agreed on the motion of the Marquis of Salisbury, that the Islington Market Bill should be argued at the Bar on Thursday the 9th.

In the House of Commons, at a morning sitting, the County Coroners' Bill was discussed in Committee, and an amendment moved by Mr. Poulter, for limiting the discretion of the coroner as to excluding the public from his court, by making it necessary that he should have the consent of the majority of the jury, was carried by a majority of 44 against 37. In the evening the Irish Church Bill was brought in and read a first time on the motion of Lord Morpeth.

On Wednesday, the 8th, Mr. Dixon brought before the

* It was stated by mistake in the last number of the "Companion," that this debate had terminated by the amendment of the Lord-Advocate having been agreed to.

House the subject of a notice of motion which had been placed on the Journals by Mr. Halse, the Member for St. Ives, with the evident intention of turning into ridicule the principle and fundamental provisions of the Corporation Reform Bill, and moved that the notice appearing to be a gross insult to the House, and to a great portion of the constituent householders of the kingdom, it should be expunged from the proceedings of the House. It was eventually resolved, on the motion of Mr. Hume, that the notice should be discontinued. A debate then took place on the motion for the second reading of a Bill brought in by Sir R. Musgrave for the introduction of a system of Poor Laws into Ireland, which ended by the motion being agreed to. It was afterwards ordered that the Bill should be committed that day fortnight. Several other Bills were then advanced a stage, and the Entailed Estates (Scotland) Bill was, on the motion of the Lord Advocate, thrown out by a majority of 89 to 19.

On Thursday, the 9th, in the Lords, the opinion of the Judges on certain questions put to them, in reference to the Islington Market Bill, was delivered by Sir J. A. Park, and was to the effect that the grant of a charter for a new market would be void, as against the privileges of the city. The Certiorari Bill was afterwards read a second time on the motion of Lord Brougham.

In the House of Commons, the Prisoners' Council Bill was read a third time and passed, after some discussion, and the rejection of several amendments by various majorities. The House having afterwards resolved itself into Committee, the schedules of the Municipal Corporations Bill were considered, and the alterations proposed in them by Lord John Russell agreed to. Mr. Roebuck moved that the number of Councillors for Bath should be thirty instead of forty-eight, as proposed in the Bill; but the motion was negatived by a majority of 105 to 74. Afterwards, a motion, brought forward by Mr. Wallace, for the appointment of a Select Committee to inquire into the management of the Post Office, gave rise to a discussion of some length; but on Mr. Labouchere engaging that a Commission should be appointed for the purpose, the Honourable Member did not persist in pressing his motion to a division.

On Friday, the 10th, Mr. Wallace moved for a copy of any document under the authority of which the sum of 30,000*l.* had been advanced to the Thames Tunnel Company, in a speech in which he characterized the advance in question as both ill-advised and irregular. Ministers intimated that there was no objection to produce the papers, and the motion was agreed to. Mr. A. Johnston then brought forward his motion for abolishing lay patronage in the Church of Scotland, but withdrew it after a short discussion. The House afterwards went into a Committee of Supply, when various sums were voted on the miscellaneous estimates. Mr. Hume then moved the second reading of his Bill for diminishing the expenses of elections. The motion was carried against an amendment that the Bill should be read a second time that day six months by a majority of 58 to 5.

On Monday, the 13th, in the Lords, the Prisoners' Counsel Bill was read a first time. The Duke of Richmond, and several other Noble Lords, afterwards addressed the House in refutation of the charges brought forward a few nights before in the House of Commons against the management of the Post Office.

In the House of Commons, a conversation of some length took place in the early part of the evening, on a petition presented from Mr. O'Dwyer, who had lately been deprived of his seat for Drogheda, by the decision of an Election Committee. It was contended by Mr. O'Connell and other Members, that the decision of the Committee was not according to law. Mr. Wynn, on the other hand, objected to the petition being received; but it was at last agreed that it should be laid on the Table. After this, Lord John Russell announced that he had received his Majesty's commands to state that he had been graciously pleased to place at the disposal of the House, for the purposes of the Irish Church Bill, all his interest in any benefices and dignities in the Church of Ireland. The Bill was then read a second time. The House next went into a Committee of Supply, when various additional sums were voted on the miscellaneous estimates; among others, a sum of 35,000*l.* for the advancement of education in Ireland, for the year ending 31st March, 1836, which gave rise to a warm altercation; but the money was at last voted by a majority of 143 to 41. Afterwards, on the motion of Mr. Rice, the House went into Committee on the Tea Duties, when it was resolved, that instead of the present discriminating duties on the various qualities of that article, a duty of 2*s.* 1*d.* per pound, should, in future, be levied on all teas taken for home consumption. Before the House rose, Mr. Tooke moved a resolution for the appointment of a Committee of nine Members, to whom all Divorce Bills should be referred, which was carried on a division, by a majority of 25 against 0.

On Tuesday, the 14th, in the House of Lords, Lord Radnor moved the second reading of his Bill for the abolition of subscription to the Thirty-nine Articles in the Universities of Oxford and Cambridge. The motion gave rise to a long discussion, which terminated in the Bill being thrown out by a majority of 163 to 57. Of the Noble Lords present, 28 were for, and 85 against the Bill.

In the House of Commons, at an early sitting, the Cruelty to Animals Bill was discussed in Committee. In the evening Lord Lowther replied to some of the observations which had been made a few nights before in the House of Lords on the subject of the Post-Office. Afterwards, on the motion of Lord John Russell, the Municipal Corporations Bill was re-committed, when some additional amendments, proposed by his Lordship, were agreed to. The House having been resumed, a Committee was appointed, on the motion of Mr. Fowell Buxton, to inquire into the treatment of the aboriginal inhabitants of British Settlements; and another, on the motion of Mr. Ewart, to inquire into the best means of extending a knowledge of the arts, and of the principles of design among the people. The next motion was one by Mr. Buckingham, for leave to bring in three Bills:—The first for the formation of walks and gardens for the recreation of the public in the vicinity of large towns; the second, for the establishment of Mechanics' Institutes; and, the third, for classifying houses of entertainment. Leave was given to bring in the two first Bills, but the motion, with regard to the third, was not persisted in. Mr. Gisborne then moved the re-appointment of the Committee of the last Session on the claims of the Baron de Bode; but the motion was negatived on a division, by a majority of 179 to 97. A warm debate followed on a motion by Mr. Wason, for the appointment of a Select Committee to consider the petitions which had been presented from Great Yarmouth, alleging that the sum of two guineas had lately been paid to many of those among the inhabitants and freemen who, at the last election, had voted for the sitting Members; but the appointment of the Committee was eventually carried, by a majority of 186 to 132. It was also, before the House rose, resolved, without a division, on the motion of Mr. Aglionby, to refer the petitions containing similar allegations from the city of York to a Select Committee.

No business of any consequence was done in the Lords on Wednesday the 15th, and the Commons did not assemble in sufficient numbers to form a House.

On Thursday, the 16th, the Lords were occupied with a discussion on the subject of 'Dens's Theology,' and the sanction which the publication and circulation of that work had received from Dr. Murray, the Roman Catholic Archbishop, and one of the members of the Irish Board of Education. The subject was introduced in a long address by the Bishop of Exeter.

In the Commons, the appointment of a Select Committee, to consider the best means of setting apart a portion of the Strangers' Gallery for the admission of ladies during the debates, was moved by Mr. G. Berkeley, and carried, notwithstanding the opposition of Lord John Russell, by a majority of 153 to 104. The House afterwards went into Committee on the Municipal Corporations Bill, when an amendment proposed by Mr. Praed, having in view to secure the right of voting for members of Parliament to the descendants of existing freemen, was negatived by a majority of 262 to 234; and another proposed by Mr. J. G. Ponsonby, to secure all the rights to which they would, under the existing law, be entitled, except that of voting for Parliamentary representatives, to the children of all freemen born before the 5th of June, 1835, and to all apprentices, was also rejected, the num-

bers being 234 for, and 203 against it. In some other divisions which followed, the Ministerial majorities were considerably larger. The first 48 clauses were agreed to, when the House resumed.

On the following evening, the House went again into Committee on the Bill, when the remaining clauses, with a few unimportant alterations, and also the schedules, were agreed to, and the Bill was ordered to be read a third time on Monday, the 20th.

On that evening, accordingly, it was read a third time, and passed, without a division, though not without strong expressions of opposition to its leading principles from several members. Several amendments were proposed and rejected; but one or two additional clauses and provisions, which were considered to be in accordance with the principle of the Bill, were agreed to.

FRANCE.

The French papers for the past month have abounded more in Spanish news and speculations on the affairs of the Peninsula, than in home intelligence. The Convention, respecting the foreign legions to be sent to Spain from Algiers, was signed by the Duke de Frias and the Duke de Broglie at the end of last month. A few days after, three French ships of the line sailed from Toulon to Algiers, and a Spanish and French Commission went to superintend the embarkation of the troops for Spain. In addition to this more immediate assistance, the French Government has imitated ours in allowing its subjects freely to enter the service of the young Queen. As to the foreign legionaires in Africa, there can be no doubt entertained of their bravery and hardihood; but their state of moral discipline, their plundering, reckless spirit, and general contempt for what they call the prejudices of religion, may, we greatly fear, render them obnoxious to the Spanish soldiery with whom they are to fight, and still more so to the credulous and devout Spanish peasantry.

At Paris, seven persons have been arrested on charge of a conspiracy to assassinate the King as he returned from Neuilly to the Tuileries. Some of the newspapers pretend that this plot had no existence save in the imaginings of Louis Philippe's police.

In the early part of July, it was confidently reported that the young Duke of Bourdeaux, whom the royalists persist in calling Henry V., was dead. The rumour was premature, but both the young Duke and his grandfather Charles X., have been dangerously ill at Toplitz. It is admitted by his warmest partisans, that the young Prince is of a delicate constitution, and this circumstance is equally regretted by republicans and ultra-royalists:—to the latter, his death would be the destruction of all hopes of a legitimate succession, and the republicans are afraid that his demise would greatly strengthen the government of Louis Philippe.

The Moniteur has published a number of excellent Ordonnances, in pursuance of votes previously passed by the Chambers, for rendering rivers navigable, for clearing and deepening the port of Boulogne, and assigning six millions of francs for the establishment of a line of packet-boats to run between France and the Levant.

A new interest has been given to the tedious proceedings of the State trials, by the escape of forty-one of the prisoners from the gaol of St. Pelagie. There were forty-four of the Parisian insurgents in this prison, three of whom declined escaping, which they might have done with the rest, their spirit being untamed by sixteen months' captivity. It should appear, however, that their confinement was not of a very rigorous nature, and that they were abundantly supplied by their friends outside the walls, with the means of enjoying themselves. "People may say what hey like about Newgate," said Oliver Goldsmith's pauper;—for his part he found it a very pleasant place, with nothing in the world to do, and prison-allowance served out regularly. But these Parisian insurgents had something better than bread and soup—their tables were supplied by a *restaurateur* of no mean fame—they had plenty of beer and wine, and eau-de-vie and cigars, and an abundance of society after their own hearts; and as a climax to their comfort and moral enjoyment, hundreds of people out of doors who considered them as martyrs suffering for the good cause.

Thirteen of the fugitives were retaken, but twenty-eight got clear off. The following account of the exploit is given in a French paper. It were a pity to abridge it:—

"The rooms assigned to the political prisoners look into a spacious court, in which they are permitted to meet and take recreation from the morning till ten o'clock at night. The prisoners being allowed to buy the wine and liquors they desire, Kersausie begged about three months ago to have the key of a cellar opening into the court, to put into it a supply of wine, beer, and liquors, and the key was given him by the director of the prison. Some time after the prefect of police having been informed that serious inconveniences arose from liquors being introduced in too large quantities, the key was ordered to be withdrawn from Kersausie. It was by this cellar that the prisoners escaped; and as the door had certainly not been broken open, it is evident that a false key had been made after the model of the other while it was in Kersausie's possession. This cellar extends under a part of the Chemin de Ronde, and required only a subterranean opening to communicate with the garden of No. 7, Rue Copeau. An opening, of about thirty feet in length by three in diameter, was made by some of the prisoners in the wall of the cellar and through the ground, and issued in the above garden beneath the shade of an alley of linden trees. This work being accomplished, their daily communications with their friends without enabled them to concert the means of passing through the garden without difficulty. The prisoners assembled every evening to read a newspaper, and afterwards sung patriotic songs, which they called their *evening prayers*, and this was the moment fixed upon for their escape. On Sunday night (12th July) soon after nine, all being in readiness, nothing remained to be done but to force the further extremity of the subterranean passage which had been left covered, which was effected in a few minutes. Twenty-eight of the prisoners thus passed, one after the other, into the garden, when the authorities having learned what was going on, fifteen others were stopped in their projected flight. A signal agreed upon had been given to their friends without, who took immediate measures to facilitate their escape from the garden. Madame V., the wife of the proprietor of the garden, has declared that, being alone with a servant at the hour above-mentioned, a gentleman, accompanied by a young lady, called and inquired for her husband. Upon her informing him that he was not at home, he begged her to give him some paper and a pen, that he might write a note to acquaint him with the object of his visit. These were given to him, and while he was writing, a violent knocking being heard at the garden door, this individual threw open the window and shutters, and told her not to be alarmed, as it was only the political prisoners making their escape. She immediately saw more than a score of persons break the panes of glass and pannels of the garden door, and pass, but having no one with her except a servant, she could not think of offering resistance. At the same time other friends of the prisoners kept watch over the porter at the street door, and thus the twenty-eight fugitives traversed the court, and reached the street in safety. A sum of money, and the address of an asylum that had been provided, were then given to each of them."

A day or two after their evasion the fugitives published a paper, stating that they could have escaped long before, but declined doing so, as they wished to avail themselves of the fine opportunity of desseminating their republican principles which was afforded them by the trial before the Peers—that they had now withdrawn themselves, only *because* their judges had resolved to separate one class of political prisoners from another, and, trying those of Lyons first, to leave them (the Parisians) in prison for another year before they should be called into court.

Not one of the fortunate twenty-eight has been retaken. Three of them, Cavaignac, Gunaird, and Imbert, have reached Brussels, where they will certainly be very unwelcome visitors. As a committee of the Court of Peers have decided by a majority of 110 to 19 to proceed with the trial in the absence of the refractory prisoners, it is said to be probable that the Lyonese part of this affair will be finished in another month. One of these republicans, Le Noir by name, and a Catholic priest—we believe an Abbé—by profession, has died in prison. Another of them, a certain Reverchon, has been sentenced to five

years' imprisonment and a fine of 3000 francs, not for his original offence, but for a violent attack on the Court of Peers.

It appears from the Paris papers that part of the army of Africa, under General Trezel, sustained a severe check from the Arabs commanded by Abdel Kader, on the 27th of June last, at Macta, in the neighbourhood of Oran, and that, besides most of their guns and baggage, the French lost 500 men. Since this event has been known, Marshal Clausel has received sudden orders to embark for Algiers, and once more take upon himself the government of that colony. We believe Count Clausel to be the very best man for the purpose, and we warmly wish his moderate conciliating measures and humane projects may not be thwarted by a set of scoundrels, as they were in 1830 and 1831.

We regret to say that the cholera is raging at Toulon. It broke out on the 8th of July, and by the following day had destroyed 468 lives.

SPAIN.

The modern Montrose of Spain—the chief prop of the Carlist cause—is no more. We mentioned in our last Number, that Zumalacarreguy was dangerously wounded, and a few days after we wrote, news reached England that, by producing locked-jaw, his wound had proved mortal. The Carlist journals in France, and the Tory papers in England, brought the brave partisan to life several times, and even assured the world that his wound was a mere scratch. But it would not do: after all their assertions, these journalists were obliged to allow that the commander-in-chief of the Legitimatists was a mortal man—nay, even that he was dead. We have no sympathy for the cause in which he perished, but we have some admiration for the individual, and do not think he has left his equal behind him, either on the part of the Carlists, or on that of the young Queen.

Almost immediately after his death, the Carlists raised the siege of Bilboa, and retired in dismay. The young Queen's army, said to amount to 20,000 men, entered Bilboa on the 1st of July, when Don Carlos had established his head-quarters at Onate. Valdez, the commander-in-chief of the Constitutional army of the north, has resigned, and been succeeded by General Santos de la Hera, who is (like Zumalacarreguy) a Basque by birth, who has seen some war in America, and who is said, moreover, to be a man of courage and activity. It seems allowed, however, that General Saarsfield would have been a better choice.

On the side of the Carlists, Zumalacarreguy's command has fallen to a well-known, but very inferior man, *i. e.* to Moreno, who presided at the execution of General Torrijos and Mr. Boyd, and who was so seriously annoyed during his stay in England last year.

The mass of the Queen's troops, commanded by General Cordova, left Bilboa on the 5th of July, with the intention, it was said, of attacking Moreno and the Carlists. On the same day a set of mad students, and other youths raised the standard of revolt at Saragossa, proclaiming, not Don Carlos, but the democratic and unsuitable constitution of 1812. It appears that the affair has alarmed the queen regent.

A battalion of the English auxiliary troops raising in London, and which are to be commanded by Colonel de Lacy Evans, arrived and disembarked at St. Sebastian as early as the 10th of July. Other detachments have followed, and are following rapidly, and thus there will soon be eight or ten thousand British soldiers in the Basque provinces. Don Carlos, it is said, has proclaimed that no quarter will be given to these foreign auxiliaries, but he must at least catch them before he shoots them; and the proclamation is not worth a moment's notice, inasmuch as both Carlists and Christinos continue to murder their prisoners in cold blood—though they are Spaniards—just as they were accustomed to do before Lord Eliot's convention. There will, therefore, be no distinction as to nations, and the British recruits have had opportunities enough of knowing the nature of the warfare in which they have engaged. General Iriarte having taken about fifty Carlists at Tafalla, shot a dozen of them, on learning which Moreno retaliated, by shooting thirty-six of his prisoners, who had all been officers in the constitutional army.

There was some sharp fighting, which ended unfavourably to the Carlists, at Mondragon on the 8th of July, and at Puenta la Reyna on the 13th; and by telegraphic intelligence received to-day (23rd) it appears that the constitutionalists gained a victory of some importance on the 16th at Larraga and Artagona, driving the troops under Don Carlos and Moreno back to Lagarda and Estella.

Moreno, on assuming the command, issued a characteristic proclamation. In it he alludes to persecutions he has undergone both in France and England, and which persecutions, he says, proceeded from the agents of usurpation and the *Masonic Lodges*, because he did his duty in putting to death the rebel Torrijos and his companions. In concluding this precious document, he pledges himself "always to do his utmost to exterminate the wicked." Since his elevation, and the loss of Zumalacarreguy, many of the Carlist troops have gone over to the young Queen.

PORTUGAL.

This country has been the scene of no striking events: the sale of the monastic property and of the rest of that property, now called "national," has been carried on in public without any disturbance, and is still proceeded with, though rather slowly, as there is an evident backwardness in some of the Portuguese to purchase what belonged to the Church, and in others a still more apparent want of ready money. A considerable number of foreigners have attended the auctions and been among the purchasers.

On the 20th of July the schooner *Viper* arrived suddenly from Lisbon with secret, and it is said, *important* despatches for our Government. She left the Tagus on a quarter-of-an-hour's notice, and strict orders were issued that no private letters should be taken on board. Whenever these circumstances occur, people must be allowed to surmise and speculate. It is said by some that fresh commotions have broken out in the interior—by others that the despatches merely relate to Donna Maria's marriage, which is longer in settling than the hurried match-makers foresaw,—and by others, again, that they are to intimate fresh changes in the Portuguese Cabinet.

A corps-d'armée amounting to 6000 men is still kept on the Spanish frontiers, and ready to march should the Queen Regent require its assistance.

TURKEY.

The insurrection in Albania, which we mentioned some months ago, has never been wholly suppressed, and appears, from recent accounts despatched from the frontiers of Bosnia, to have acquired more vigour and extension than ever. Although the Pasha of Scutari had received a reinforcement of 2000 men, he was not in a condition to move from that city, which was surrounded by the insurgents, in good part reduced to a heap of ruins, and in want of provisions. Discontents have also broken out among the Bosniaks, and the Servians now under the protection of Russia, have had some quarrels with the Turks.

Many of our newspapers have been declaiming and raving these last three weeks about the indignity put upon Great Britain by Turkey, or rather, as they say, by Russia, in prohibiting the passage of the Dardanelles to the man-of-war which is to carry out Lord Durham. Now, it happens that there is nothing new in all this, but on the contrary, that the regulation is of a very respectable antiquity, and has been submitted to as usage, and so far acknowledged as a right, by many ambassadors and ships of war, under all kinds of administrations, Tory as well as Whig. The practice, indeed, has always been for an ambassador to quit the man-of-war sent out with him, on the coast of Troy or at the entrance of the Dardanelles, and thence to continue his voyage to Constantinople in country boats, or small unarmed vessels; or, if a land journey were preferred, to cross the Dardanelles to the town of Gallipoli, and then travel along the European side of the Sea of Marmora to the capital, the man-of-war, on scarcely any occasion, being allowed to pass the first castle on the Dardanelles. In this way envoy after envoy has proceeded

on his mission, and we may name among the instances which come within the present century—Mr. Arbuthnot, Mr. Allan, Mr. Stratford Canning, Sir Robert Liston, Lord Strangford, and Mr. Stratford Canning again. This rule has been observed long before Russia had any influence over the Sultan, and has been insisted upon even when the Sultan and the Czar were at war with each other, and when the conflict between them was far from being of that unequal, and (for Turkey) hopeless nature that it has become since 1828. France has submitted as well as England, the regulations being, for many ages, that while unarmed merchantmen of all friendly nations might pass and repass the Dardanelles, on allowing a search by Turkish officers, both in going and returning, no man-of-war, of any nation, should pass the strait *with her guns on board*. On one or two occasions a frigate has landed her artillery and then proceeded; and of late years the Sultan has granted express permission for a frigate or two, or a sloop-of-war with some smaller craft, to go up to Constantinople in full warlike trim, and without any hindrance, but this was held in the light of a special favour or an exception to the general rule, and not as a right. During Sir Robert Gordon's recent and very unsatisfactory embassy, the Blonde frigate and another vessel lay for months in the Bosphorus, but that was at a season when the Sultan was greatly embarrassed. If permission be asked for the passage of the ship conveying Lord Durham, we believe it will be readily granted. We have said these few words to show the unreasonableness of the Tory attacks on our present Ministry on this head, and the incorrectness of the journalists in treating this matter as if it were altogether new.

HOLLAND.

The loyalty of the Dutch has been somewhat affected by the heavy demands upon their purse, which the King has been obliged to make in consequence of his late expensive warlike demonstrations; and they begin seriously to think it were better to give up Luxembourg and the other points that stand in the way of a final adjustment with Belgium, than pay so dearly for a very uncertain delay. In several parts of the country popular discontent at a new tax has manifested itself in riots, and there have been some serious disturbances at Amsterdam. It should appear that the King can afford to be more obstinate abroad than at home, for, it is said, that his government has formally announced its intention not to press the payment of the obnoxious tax and to wipe out all arrears.

CHRONICLE OF OCCURRENCES.

June 24. D. Salomons, Esq., a gentleman of the Jewish persuasion, was elected one of the sheriffs for the city of London. Objections have been made to the validity of the election on the ground that the oath required of sheriffs on entering office contains the words "on the true faith of a Christian," and that the act of indemnity does not reach the case.

25. A duel took place in Dublin between Mr. Haire, the chairman of the commission appointed to inquire into the disputed election of Messrs. O'Connell and Ruthven, and Mr. Murphy, a barrister acting in the interest of the sitting members. The parties fired twice without effect.

27. Mr. Charles Matthews, so justly celebrated in the theatrical world for the exquisite life and humour of his delineations of character and manners, died at Devonport, after a lingering illness. He was nearly sixty years of age, of which upwards of forty had been spent in his profession.

— The late Mr. Cobbett was buried this day in the churchyard of Farnham, in Surrey, his native town. The funeral was attended by Messrs. O'Connell, Wakley, Fielden, and a number of other gentlemen. The mortal remains of this remarkable man, after his long and busy life, rest with those of his humble ancestors. Many thousand persons witnessed the ceremony.

29. Serious disturbances occurred at Great Bircham, in Norfolk, owing to the execution of that part of the Poor Law Amendment Bill, which enacts that relief shall be given in kind instead of in money. The peasantry rose in a body against the parish officers, refused to work for the farmers, and assaulted two men who were willing to work. The house of the principal farmer of the parish was attacked and set on fire; but on the military being called out the riot was suppressed without bloodshed.

30. Lord Suffield met with an accident, which caused his death on the 6th of July. As he was riding down Constitution Hill, on his way to the House of Lords, his horse stumbled, and rolled over him, by which he received several injuries, which, however, were not at first suspected to be of a nature to endanger life. His lordship was in his fifty-fourth year.

— In the Court of King's Bench Sir John De Beauvoir (who, after being returned to Parliament for the borough of Windsor, was unseated by the decision of a Select Committee of the House of Commons) was tried for perjury, on the allegation of having sworn to an insufficient qualification. The jury, without hesitation, returned a verdict of not guilty.

July 1. The eighth annual meeting of the Royal National Institution for the preservation of life from shipwreck, was held at its rooms in Austin-friars, Thomas Wilson, Esq., in the chair. The report stated that since the last meeting 663 persons have been saved from shipwreck, a great number of whom have been preserved through the immediate instrumentality of the society, by the means it has provided on the coasts of the United Kingdom, and the remainder by persons to whom the committee have granted honorary or pecuniary rewards. At the last anniversary dinner, the Trinity House, which had previously presented the institution with 500*l.*, gave a further donation of 200*l.*, and the East India Company 100*l.*, in addition to a previous donation of 300*l.* Additional life-boats had been placed the last year at Irvine, N.B., the mouth of the Tees, Carmarthen, and Berwick-upon-Tweed, and, by the French government, off Boulogne; and very satisfactory results have attended the experiments with Mr. Dennet's rocket apparatus. Since its first establishment the institution has granted 50 gold medallions and 200 silver medallions as honorary distinctions of merit; has paid more than 4000*l.* as pecuniary rewards to upwards of 3400 persons who have been instrumental in saving the lives of above 3500 shipwrecked mariners, and expended a sum exceeding 3800*l.* for life-boats and other improved apparatus, which have been placed on various parts of the coasts of the United Kingdom.

— Special orders were issued by the Lord Lieutenant of Ireland for the prevention of party processions on this day, being the anniversary of the battle of the Boyne. A procession however having taken place in Monaghan, a riot ensued, when one person was shot and several wounded. A barrister has been sent down by Government to investigate the matter, but his report has not yet been published.

— At a levee, held at St. James's, the Earl of Durham had an audience of the King, on taking leave, as ambassador to St. Petersburgh.

2. The proprietors of the 'John Bull' newspaper brought an action in the Court of Common Pleas against a Mr. Rosier, who, it was alleged, had induced the editor to publish a libellous paragraph on an individual, on his engagement to take the responsibility. The person against whom the paragraph was directed having recovered damages from the newspaper proprietors, the present action was brought to compel the author of the paragraph to defray the expenses. The jury found a verdict for the plaintiffs.

— The Royal Tar steamer, of 700 tons burthen, left the Thames for San Sebastian, having on board the first detachment of the British Auxiliary Legion, now raising in England, under the command of Lieutenant-Colonel Evans, M.P. for Westminster, destined for the service of the Queen of Spain. Official intimation has been made that all pensioners entering the service of the Queen of Spain will retain their pensions.

3. Seventeen persons were drowned in a coal-pit about four miles from Bolton, by the flowing in of the water from the river Irwell, on the banks of which the pit is situated.

4. A number of individuals charged with being concerned in the riots at Wolverhampton, [see last month's Chronicle,] were sentenced at the Stafford sessions to various periods of imprisonment.

— This day the usual ceremonies and entertainments commenced at Cambridge on the installation of the Marquis of Camden as Chancellor of the University. A great many distinguished indi-

viduals were present; among others, Prince Pozzo di Borgo, the Dukes of Cumberland, Wellington, and Grafton, the Archbishop of Canterbury, Lords Lyndhurst, Abinger, &c. &c.

— About 120 gentlemen dined together at Blackwall to celebrate the triumph of Messrs. Morrison and Wason in their late election for Ipswich, after having succeeded in unseating the former members, and exposing the bribery which had been practised. Mr. O'Connell was in the chair.

— In the Court of Common Pleas, Dublin, a special jury case, the parties being Lord Trimblestone *versus* Kemmis, and the matter being an action of ejectment on the title, to recover possession of the manor of Roebuck, was decided for the defendant, after occupying six days. Property to the amount of 400,000*l.* was said to depend on the result.

8. At a levee, Sir F. Shuckburgh, chairman of a Committee of Baronets, presented to his Majesty two petitions from certain of the baronets of England, of Scotland, of Ireland, and of the United Kingdom, and their eldest sons, praying a restoration of various privileges originally belonging to the order, but stated to have been in abeyance since the Restoration.

9. The eighth vessel which has been taken up by Government, under the management of the Emigration Committee, for the conveyance of females to New South Wales, sailed from the Thames. The number sent out in this instance was 160 single females, and about forty other persons, chiefly agriculturists, and their families.

12. Dr. Elrington, bishop of Leighlin and Ferns, died at Liverpool, having landed there on his way to London, in order to be present at an intended conference of Irish bishops, about to be held in the British metropolis. He was upwards of seventy years of age, and had the character of being a learned and able man. The bishopric of Ferns becomes, by his death, in virtue of the Irish Church Temporalities Act, united to that of Ossory.

— On the evening of this day and the whole of the succeeding day, the town of Liverpool was in a state of great excitement owing to the riotous conduct of large portions of the lower class of Irishmen. The 12th of July being the anniversary of the Battle of Aughrim, these misguided people were under an impression that an Orange procession was to take place, and they therefore assembled, armed with bludgeons, and committed some desperate breaches of the peace. Many persons were severely injured.

— On the same day, in Belfast, a serious riot occurred, produced by the obnoxious party processions which have so frequently disturbed the peace of the country. The Riot Act was read, the military called out, one young woman was shot, and many persons wounded.

— Riots have also occurred in Port Glasgow and Airdrie, a small town near Glasgow, caused by attempts to get up imitations of the Irish processions. In the case of Airdrie the military were called out, and a great number of the rioters were seized and committed to prison. No lives were lost in these instances.

13. The New Goldsmiths' Hall, in London, was formally opened by a banquet, at which the Duke of Wellington, Sir Robert Peel, the Marquis of Camden, &c., were present, and on their healths being drunk made speeches.

16. A frightful accident occurred at Watford, on the London and Birmingham Railway, by the falling in of a portion of a tunnel in progress of formation, by which many of the workmen lost their lives. Several of the Directors of the Company, accompanied by the Secretary, went down from London to examine the spot, and their Report has been published. It states that the men engaged on the works on the shaft having all perished, the proximinate cause of the calamity can only be conjectured. The shaft having been sunk in chalk, it is supposed to have given way to the pressure. On the same morning, and on the same railroad, another accident occurred on a part of the works on the north side of Primrose Hill, near London. A portion of the roof of a newly excavated part of the tunnel fell in. There were seven men at work, six of whom escaped, but the seventh was buried beneath the earth, and though got out alive was carried to the North London Hospital in a hopeless state.

17. The Rev. Mr. Dupré, master of the endowed school of Berkhamstead, the management of which was the subject of recent animadversion in the House of Commons, brought an action against a Mr. Campbell for libel, which was tried at Winchester. The libel complained of was published in the 'Bucks Herald;' the matter of it consisted of comments on the conduct of the schools, and the defence set up was a plea of justification, alleging the truth of the charges. The jury found a verdict for the plaintiff with 25*l.* damages, on certain of the issues raised by the pleas, and for the defendant upon two of the issues, those which asserted the right of the public generally to admission to the school, and also that for twenty-five years there had not been a scholar educated in the establishment.

18. A public meeting was held at the Crown and Anchor, Strand, for the purpose of adopting petitions to both Houses of Parliament, praying for a total repeal of the stamp duties on newspapers. The meeting was attended by upwards of 2000 individuals. Lord Brougham presided; and the resolutions were proposed by Dr. Birkbeck, Messrs. Hume, Grote, O'Connell, Dr. Bowring, Rev. W. J. Fox, &c.

24. At a quarter to six in the evening of this day, the 'Earl Grey' steam-packet from Rothesay and other places to Glasgow, having stopped for a short time at Greenock to disembark passengers and receive others, just as she was about to depart suddenly exploded. The effect was dreadful. The boiler of the vessel was rent asunder, the top of it standing erect, having torn up the deck, and blown into the air all the passengers who had been standing between the funnel and the cabin-door. A great number of the passengers fell into the sea, where many were severely wounded from the falling fragments of the deck and large pieces of coal. The spectators on the quay, also, who were at the time very numerous, suffered greatly, many being knocked down and scalded by the boiling water, and others wounded by the falling missiles, some of which were thrown fifty or sixty yards from the vessel. The number of lives lost has not yet been accurately ascertained; but the 'Greenock Intelligencer' gives a list of six persons whose bodies have been discovered, and of thirty others who have been more or less injured. A judicial investigation into the causes of this melancholy occurrence has been instituted.

28. A telegraphic dispatch announces that on this day, as the King of the French was on his way to the Place Vendôme, his Majesty, and the cortège by which he was surrounded, were thrown into confusion "by the explosion of an infernal machine, placed behind a window, by which his Majesty's horse was killed, but his Majesty, as well as the princes, escaped unhurt. The Duke of Treviso was killed, and several generals, aides-de-camp, and individuals of the National Guard, were either killed or wounded. The people rushed after the King with acclamations of loyalty, after this horrible attempt, at which all Paris was indignant. The metropolis was otherwise calm."

Great distress, reaching to absolute famine, has prevailed for the last two months among the peasantry on the west coast of Ireland, and principally in the county of Mayo. The deplorable situation of the miserable people has excited the active sympathy of benevolent individuals, and various efforts have been made to supply them with food. Some very heart-rending details of privation and destitution have appeared in the newspapers.

Intelligence has been received respecting a China ship, named the Eliza, for which considerable anxiety had been felt by the merchants of the city. The ship, on her way home from Macao to England, struck on some rocks in the China sea; she was subsequently boarded by the people of a Chinese fishing-boat, who ill-used the crew, and plundered the vessel; and a few days afterwards two Chinese junks arrived, and putting on board twenty men, completely rifled the unfortunate ship. The captain and crew, with the exception of four men who were left on a small island, ventured to sea in the boats, and were picked up and brought to Singapore.

At the Cape of Good Hope it appears that the incursions of the Caffres have been effectually checked, and that a treaty was about to be entered into, by which compensation was to be made by the invaders in the shape of so many thousand head of cattle, and that a new boundary was to be formed. But few of the scattered colonists have yet returned to their farms.

Intelligence from South America states that an earthquake on the 20th February last laid waste the cities of Conception and Talcahuana.

It is stated that a newspaper of eight quarto pages has been established at Owhyhee, (Sandwich Islands,) which is illustrated with wood-cuts of animals.

Great damage has been done to the British shipping at Quebec, by a tremendous gale. Many of the timber rafts were broken up and sent adrift.

CHANGES OF ADMINISTRATION, AND HISTORY OF PARTIES.

[Continued from Number 29.]

[Errata in Number 29.—p. 366, col. 2, line 20 from bottom, *for* "parting" *read* "hurting."—p. 370, col. 1, line 11 from bottom, *dele* the sentence beginning "In the Household, the Duke of Portland," &c.]

ALTHOUGH the principal appointments in the Government had at last been filled up by Lord Chatham for the present in the manner that has been mentioned, his lordship seems to have felt that the administration he had formed was not, as yet, by any means strong enough to face the combined parties which were likely to constitute the Opposition in the ensuing Session of Parliament. He therefore directed his views to the arrangement of such new connexions as might at once enlarge the basis of the Government, and detach part of the force which threatened to be arrayed against it.

To gain time for these negociations, the meeting of Parliament, which had been prorogued to the 16th of September, was further postponed till the 11th of November. This step was adopted at a moment when, owing to the deficiency of the harvest, the public mind was in a state of the greatest alarm from the apprehension of a scarcity of food. To provide against this danger, and to quiet the excitement, on the 2nd of October ministers took upon them to issue an order in council prohibiting the exportation of grain, although prices had not yet arrived at the point fixed for such prohibition by the law, and laying an embargo on all vessels about to proceed abroad with that article. Soon after this Lord Chatham withdrew for the benefit of his health to Bath.

Here he presently sought and obtained an interview with the Duke of Bedford, who had also come to Bath with the same object. Having stated that he was anxious to secure the Duke's support to the new administration—an intimation to which his Grace made no reply—he went on to describe the foreign and domestic policy which he was resolved to pursue. It was comprised, he said, under three heads: first, to preserve the peace inviolate, and to keep a watchful eye over the continental powers that they did the same; secondly, to enter into no continental connexions, and to make no treaty with any continental power binding Great Britain to the payment of a subsidy; and, thirdly, to observe the strictest and most rigid economy. The Duke replied that these were precisely the measures for which he had always contended, and he certainly would support them, whether his friends were in power or not. On this they parted, with the understanding, however, that they would soon meet again.

Accordingly, Parliament having met on the day appointed, (the 11th of November,) the Bedford party at first took little share in the contests which immediately ensued. The Address was opposed in both Houses, and in the Commons no fewer than four amendments upon it were successively moved; but on every division the majority was with the Government. In none of the amendments was the subject of America alluded to. The principal topic on which the Opposition took their ground was the unjustifiable delay which, as they alleged, had taken place in the assembling of Parliament in the critical circumstances in which the country stood. The step taken by the Ministry in preventing the exportation of corn was admitted by all to have been, at the moment when it was adopted, a necessary stretch of power; but the Opposition contended, first, that it was rendered necessary only by the prorogation of Parliament; and, secondly, that the Ministers ought now to come to Parliament for a Bill of Indemnity to cover their violation of the law and the constitution. These points appear to have been discussed in the two Houses, both in the debates on the Address, and again in the consideration of a bill which was soon after brought in by the Government to indemnify the subordinate agents employed in executing the embargo, but in which the Ministers at first refused to allow their own names to be comprehended. The parliamentary proceedings of this session have been very imperfectly reported; but the arguments employed on both sides of the present question, in the House of Lords, have been preserved both in a tract entitled 'A Speech in behalf of the Constitution, against the Suspending and Dispensing Prerogative,' which is now known to have been written by Mr. Mackintosh, assisted by Earl Temple and Lord Lyttleton, although it was at first supposed to have been the production of Lord Mansfield—and in one of the letters from the Right Honourable Henry Flood to Lord Charlemont, printed in the collection which appeared in 1820. The Speech is given in the 'Parliamentary History,' as embodying the arguments which were used in a debate on the 10th of December, when the Bill of Indemnity, having passed the Commons, was brought up to the Lords. The debate, however, of which Mr. Flood gives an account, is evidently that which took place on the Address.

According to the testimony of Mr. Flood, Lord Chatham appears to have defended the issuing of the embargo during the interval of Parliament by legal authority, simply as an act of power to be justified before Parliament on the ground of necessity; so far from expressing himself as opposed to a Bill of Indemnity for ministers, his argument might be taken as implying the necessity of such a bill. It seems to have been Lord Northington, the President of the Council, who first broached the doctrine that the embargo was not only justifiable but legal, and that the crown had a right, in cases of necessity, to interpose even against a positive act of Parliament. His lordship, in advancing this extraordinary position, Mr. Flood records, said he was no patron of the people, and used something like sarcasm towards Lord Chatham. "He challenged any lawyer," continues the writer, "to contradict him. Lord Mansfield, for the first time on the side of the constitution, rose up, but, good as his ground was, he was afraid to tread upon it. . . . At length he asserted the want of power in the crown in plain terms, though when charged with it by Lord Camden, he denied his having said so. He was accurate, and able, and almost eloquent, but the character of the man defeated his capacity; for with the most popular and constitutional ground under his feet, and Lord Camden on the contrary, he was afraid to speak out. He relinquished efficacy for insinuation, and force for management. Both the men were misplaced; the artifice and almost chicanery of Lord Mansfield was suited to Lord Camden's ground, and the simplicity, frankness, and warmth of Lord Camden would

[Printed by WILLIAM CLOWES and SONS, Stamford Street.]

have become Lord Mansfield's situation. Thus the nature of these two men, wise and great as they are, prevailed over their judgments, and the one could not rise, nor could the other fall to his condition. Lord Camden supported Lord Northington's tenet; I grieve to say it, and I cannot dwell upon it. He is always eloquent, for he always feels, and he made the worse appear the better cause. This tenet made a prodigious noise. I ought to have remembered that after Lords Northington and Camden had spoken, Lord Chatham spoke again, and concluded with calling the embargo an act of *power*. Such I still think it, said he, *justified* by *necessity*, and with referring himself to the judgment of Parliament. Lord Spencer, I saw, moved the Address; he was inaudible. Lord Hillsborough seconded the Address, and what he said was a bad opposition to it. Lord Suffolk did it much more favour by opposing it; he spoke pompous nothings. Lord Shelburne was better, and the Duke of Grafton worse, than I expected. Lord Lyttleton was reasonable, and Lord Temple as bad as he could be. I have mentioned that this doctrine made much noise; but as Lord Chatham had kept clear of it, it would have died if Beckford had not revived it, in two days after, in the House of Commons, in more offensive words, by saying, that the crown had, in cases of necessity, a power to *dispense* with laws. This, which at another time would have been laughed out of the House, became serious, though spoken by such a scattering man. George Grenville took down the words; they were condemned by every body. The doctrine, in the Lords, was mentioned with very severe strictures, and Mr. Beckford was obliged to explain, by a retraction, and contradiction, in fact, of what he had said, which remains in the Journals. This was a triumph to George Grenville; he urged that a Bill of Indemnity was further necessary to indemnity the advisers, as well as the actors, under that order. General Conway agreed in condemning the doctrine, but did not seem to think that it was necessary to indemnify the advisers. He moved for leave to bring in a bill to indemnify the persons acting under the order. Lord Chatham, like himself, on hearing this affair, desired the bill to be made as strong as possible, and to be extended to the advisers, and to be made declaratory as well as indemnifying. It has been thus framed accordingly, and is brought in; but it is still thought that Mr. Grenville will offer amendments, and keep the ball on foot."

If we may trust the account given in the 'Parliamentary History,' the discussion was in fact renewed in the House of Lords when the Bill of Indemnity was brought up to that House on the 10th of December. But we are ignorant of the grounds or authority upon which the editor of that publication has attributed the delivery of the arguments embodied in the "Speech in behalf of the Constitution," &c. to that occasion. It is, however, expressly stated in the Annual Register, "that the bill produced much altercation and debate, especially in the House of Lords." The bill, in its original form, was brought into the House of Commons, by General Conway, on the 24th of November. The writer in the Annual Register says that it was amended and made perfect before being sent up to the Lords, in so far as both to include the advisers of the embargo, and to express fully in its preamble the illegality of the measure. We may observe, by the by, that according to the statement in the Parliamentary History, which in this instance, appears to be copied from the Journals, Alderman Beckford's remarks, spoken of by Mr. Flood, were made on the 18th of November, and in the course of debating the motion for leave to bring in the Bill of Indemnity. The words were that "whenever the public is in danger, the King has a dispensing power."

Meanwhile the premier proceeded with his endeavours to disunite and break up the opposition. The next negociation which he opened was with the party of the Duke of Newcastle. According to a statement copied by Almon in his 'Anecdotes of Lord Chatham' from the publication called the Political Register, his lordship, on the 20th of November sent a note to Lord Edgcumbe, requesting to see him at his house in Bond Street. At the interview which took place, he informed Lord Edgcumbe, after many apologies, and with much awkwardness, that it was necessary he should resign to another his post of Treasurer of the Household. An angry altercation ensued, which terminated by the minister exclaiming, in reply to a remark Lord Edgcumbe made about the impolicy of turning out persons of [illegible] great parliamentary interest, "I despise your parliamentary interest! I do not want your assistance!" and adding "that he trusted to the uprightness of his measures for the support and confidence of the King, and the favour and attachment of the people, and that acting upon these principles he dared look in the face of the proudest connexions in the country." They then parted, Lord Edgcumbe having previously intimated that after the usage he had received he would neither accept of any other place, nor resign that which he held to any one but the King himself. The Minister in the course of the conversation had offered to make his lordship a Lord of the Bedchamber. Two days after Lord Edgcumbe received a note from his Majesty, desiring him to return his staff. On Monday the 24th, accordingly, his lordship went to the King, and gave up his office, which was immediately bestowed upon Mr. (afterwards Sir) John Shelley, a near relation of the Duke of Newcastle. On the 26th the Duke of Portland resigned the office of Lord Chamberlain, the Earl of Scarborough that of Cofferer, the Earl of Besborough that of Joint-Postmaster-General, and Lord Monson that of one of the Chief Justices in Eyre. To these resignations were speedily added those of Sir Charles Saunders, the First Lord of the Admiralty, and of Admiral Keppel and Sir William Meredith, two of the junior Lords.

It is understood that these secessions induced the Minister to resume the negociation with the Duke of Bedford, which he had otherwise intended to have dropped. He now offered the appointment of First Lord of the Admiralty to the Duke's cousin and brother-in-law, Lord Gower, who immediately repaired to Woburn to consult his Grace. In the meantime, however, his Majesty being informed of what had taken place, intimated to the Premier, in a long conference to which he admitted him, that although he would give him his cordial support in other respects, the conduct of the Duke of Bedford on a former occasion had been so offensive that he must entreat that his name should not be again mentioned. This placed Lord Chatham in a most embarrassing situation. He and the Duke met again at the house of the former in Bond Street, on the 1st of December. His Grace proposed that several of the vacant offices should be given to certain of his friends whom he named, and that an English peerage should be conferred upon the Marquis of Lorne. Upon this last proposition the Minister at once put his negative. He then stated, to the astonishment of the Duke, that the places in question had been already disposed of, and mentioned the persons to whom they had been given. In a few days after, the Gazette announced the appointment of Sir Edward Hawke as First Lord of the Admiralty; of Mr. Jenkinson (afterwards Lord Liverpool) and Sir Piercy Brett, as the two new junior Lords, and of Lord Le Despencer as the new Joint-Postmaster-General. Lord Cornwallis was also appointed Chief Justice in Eyre; the Earl of Hertford, Lord Chamberlain of the Household; and Mr. Hans Stanley, Cofferer.

The strangest part of the whole history is, that after the negociation with the Duke of Bedford had been completely broken off in the manner that has just been stated, Lord Chatham, of his own accord, bestowed upon Lord Lorne the English peerage, which he had so peremptorily refused when proposed by his Grace. The Marquis (afterwards Duke of Argyle) was created Baron Sundridge of Coombank, in Kent, by a patent dated the 22nd of December. About the same time also the Earl of Hillsborough was removed from the head of the Board of Trade, and the place given to another of the Duke of Bedford's friends, Robert Nugent, Esquire, with the title of Viscount Clare, in the peerage of Ireland. Some years after Lord Clare was made an Irish Earl, by the title of Earl Nugent.

Lord Chesterfield in one of his letters, writing before these changes were announced, says, "Eight or nine people of some consequence have resigned their employments; upon which Lord Chatham made overtures to the Duke of Bedford and his people, but they could by no means agree, and his Grace went the next day, full of wrath, to Woburn, so that negociation is entirely at an end. People wait to see who Lord Chatham will take in, for some he must have; even *he* cannot be alone, *contra mundum*."

"He made an administration"—says Burke, in a celebrated passage of his Speech on American Taxation—"so chequered and speckled; he put together a piece of joinery, so crossly indented, and whimsically dovetailed; a cabinet so variously inlaid; such a piece of diversified mosaic; such a tesselated pavement without cement; here a bit of black

stone, and there a bit of white; patriots and courtiers, king's friends and republicans, Whigs and Tories, treacherous friends and open enemies, that it was indeed a very curious show, but utterly unsafe to touch, and unsafe to stand on. The colleagues whom he had married at the same boards stared at each other, and were obliged to ask, 'Sir, your name?—Sir, you have the advantage of me.—Mr. such a one.—I beg a thousand pardons.' I venture to say, it did so happen that persons had a single office divided between them who had never spoke to each other in their lives, until they found themselves, they knew not how, pigging together, heads and points, in the same truckle-bed." The allusion here is to the Joint-Paymasters-General, Lord North and Mr. George Cooke.

When all the new appointments had been made, Lord Chatham returned to Bath, where soon after a violent attack of gout for some time rendered him totally incapable of taking any part in the direction of affairs. What followed with the ill-assorted collection of persons with which he had filled the Cabinet has been graphically described by Burke. "Sir, in consequence of this arrangement, having put so much the larger part of his enemies and opposers into power, the confusion was such that his own principles could not possibly have any effect or influence in the conduct of affairs. If ever he fell into a fit of the gout, or if any other cause withdrew him from public cares, principles directly the contrary were sure to predominate. When he had executed his plan he had not an inch of ground to stand upon. When he had accomplished his scheme of administration, he was no longer a Minister. When his face was hid but for a moment, his whole system was on a wide sea, without chart or compass. The gentlemen, his particular friends, who, with the names of various departments of Ministry, were admitted to seem as if they acted a part under him, with a modesty that becomes all men, and with a confidence in him that was justified even in its extravagance by his superior abilities, had never, in any instance, presumed upon any opinion of their own. Deprived of his guiding influence, they were whirled about, the sport of every gust, and easily driven into any port; and as those who joined with them in manning the vessel were the most directly opposite to his opinions, measures, and character, and far the most artful and powerful of the set, they easily prevailed, so as to seize upon the vacant, unoccupied, and derelict minds of his friends, and instantly they turned the vessel wholly out of the course of his policy."

One of the earliest subjects which engaged the attention of Parliament was the regulation of the affairs of the East India Company, which had just been suddenly raised from its original condition of a trading association to the possession of extensive dominions, by the extraordinary victories of Clive. We mention the matter here, however, merely as contributing to indicate the state of parties. A sketch of the first debate to which it gave rise in the House of Commons, has been preserved by Mr. Flood in the same letter to which we have already referred. The affair of Alderman Beckford's unfortunate remarks, he says, aggravated by the multitude of private discontents which mingled with it, produced a ferment, and encouraged all the parties that were unsatisfied to join against Lord Chatham on the day that the motion was made for examining into the state of the Company. Strangely enough, Beckford had been chosen to make the motion, which, Flood says, both contained offensive matter, and was offensively introduced. "Our friend Burke," he continues, "rose first in opposition, and acquitted himself very honourably. Yorke, G. Grenville, Thurlow, Rigby, Dowdeswell, Wedderburn, all joined." On the ministerial side the speakers were, Charles Townshend, Barré, Conway, the Attorney-General, the Master of the Rolls (Sir Thomas Sewel), Mr. Hans Stanley, &c. "Upon the whole, however," continues the writer, "there was little concert, and not much ability in the defence. The opponents were more successful upon the whole, though no one person near Townshend. He is the orator—the rest are speakers." The motion (or rather a modification of it, proposed by General Conway) was at last carried, about half-past eleven, by a majority of 129 to 76; so that the strength of the Ministry appears, after all, to have been not so inconsiderable. Yet on this occasion, according to Flood, the adherents of the Duke of Bedford, of the Marquis of Rockingham, of the Duke of Portland, the Duke of Devonshire, Lord Temple, George Grenville, and the Yorkes, together with the friends of the Company, all united against them. They were also opposed by some of the Bute party, while others of that section went away, and two of its most eminent members, Oswald and Elliot, sate silent, and, we presume, did not vote. This debate appears to have taken place on Tuesday the 25th of November, the day before the resignations of the Duke of Portland and the other officers of the Household already mentioned. Mr. Flood goes on to observe, "Resignations will spread wide, it is said, and who is to come in, or whether any administration can be fixed, is unknown. Four or five days ago Lord Edgecumbe was dismissed, and Jack Shelley put into his place. This offended. Lord Chatham has refused all explanations upon the subject, it is said; complains that there is nothing but faction round him, and seems determined to go on unmoved, and to break through it or fall."

It was not till February, 1767, that Lord Chatham found himself sufficiently recovered to attempt leaving Bath; and even then he was taken ill again on the way, and did not reach London till after the lapse of some weeks. In a letter to Mr. Flood, written from London on the 19th of that month, Lord Charlemont says, "All matters here go on as usual. Lord Chatham is daily expected, and till he arrives nothing worth informing you of is likely to happen. There has been, upon various topics, a great deal of conversation in the House of Commons, but no divisions. One thing, however, appears very extraordinary, if not indecent—no member of the Opposition speaks without directly abusing Lord Chatham, and no friend ever rises to take his part. . . . . Is it possible that such a man can be friendless?" The following account is given in the Life of Lord Chatham by Mr. Thackeray:—"At length he reached the metropolis, but being wholly incompetent to the transaction of public business, he retired to Hampstead. Conceiving the air of this place too sharp for his disorder, he expressed a wish to repossess his former house at Hayes. The owner, Mr. Walpole, very handsomely gratified his desire, and allowed him to repurchase the property. Whilst Lord Chatham was at Hampstead, the King sent frequent messages to inquire after his health, and to desire him not to be disconcerted by his confinement, or by his necessary absence from public business, as his Majesty was determined to support him. But however consolatory these gracious messages from the Sovereign proved to Lord Chatham, he now perceived that his influence with his colleagues in office was at an end, and that he could hope to effect scarcely anything for the public welfare."

Meanwhile the unsteady character of the ministerial majority in the Commons was demonstrated by a vote to which that House came on the 2nd of March, on the motion of Mr. George Grenville, for reducing the land-tax for the ensuing year from four to three shillings in the pound. This motion, after a debate, was carried against Ministers by a majority of 206 to 188. "This," says the 'Annual Register,' "was said to have been the first money-bill in which any minister had been disappointed since the Revolution."

On the 6th of April Lord Chesterfield writes:—"I can give you no account of our political world, which is in a situation that I never saw in my whole life. Lord Chatham has been so ill these last two months, that he has not been able (some say not willing) to do or hear of any business; and for his *sous-ministres*, they either cannot, or dare not, do any without his directions, so that everything is now at a stand. This situation, I think, cannot last much longer."

On the 9th of the same month Lord Charlemont writes to Mr. Flood:—"Lord Chatham is still Minister, but how long he may continue so is a problem that would pose the deepest politician. The Opposition grows more and more violent, and seems to gain ground; his ill health as yet prevents his doing any business. The Ministry is divided into as many parties as there are men in it; all complain of his want of participation. Charles Townshend is at open war, Conway is angry, Lord Shelburne out of humour, and the Duke of Grafton by no means pleased."

The proceedings of this interesting session of the legislature have been so imperfectly transmitted through the ordinary channels, that, with the exception of two or three fragments of the speeches of particular members, the 'Parliamentary History' contains no account of any debate from the end of the year till the middle of May. Any addition, therefore, that can be made to the scanty record, becomes of more than ordinary value. In the Manuscript Collection of General Conway's Letters, are two referring to this period, which are not in his handwriting, and have neither address

nor signature, so that we cannot tell by or from whom they may have been written. It is possible that they may have been dictated by General Conway to an amanuensis, though the tone and manner certainly would not indicate that the writer was one of the Ministers. The probability at any rate is, that they were prepared, like the other letters, for the information of Lord Hertford. We shall here give the first entire, referring as it does to the subject of American affairs, of the important proceedings that took place with regard to which this session, the published accounts are so extremely meagre and unsatisfactory. The letter is dated "Saturday, 11th April, (probably a mistake for the 12th, which was a Saturday,) 1767," and is as follows:—

"Yesterday I was present at a long debate in the House of Lords, which lasted five hours, upon a motion made by the Duke of Bedford concerning North America. The case was this:—Among the papers laid before the House from that quarter was an act passed by the Assembly of Massachusets Bay (at the requisition of the Secretaries of State here) for raising money to make compensation to the sufferers by the riots occasioned by the Stamp Act, in which was likewise inserted a clause containing a full pardon to the rioters, which is considered here, and justly, as a piece of great presumption in them, and altogether unprecedented; for, according to the British constitution, all general acts of pardon, indemnity, and oblivion, never take their rise in either House of Parliament, but are sent from the King, are read only once in each House, and are immediately accepted and passed, precisely as they come from his Majesty. Governor Bernard's letter accompanying this act was read, upon which the Duke of Bedford moved that the House should address his Majesty, to take the validity of that act into his royal consideration; and if it should be found to be null and void, that he would be pleased to take such measures as he should think proper to support the dignity of his own prerogative, and the legislative authority of this kingdom over the colonies, or words to this effect. In the debate which ensued, the Lords appeared to be all of one opinion in regard to the impropriety and absurdity of the act in question, nor do I remember anything urged in extenuation of the conduct of the Massachusets Assembly, but by one Lord, who said he imagined they *meant* nothing insolent in this procedure. Some objected to the words of the motion (I think very justly) as recommending to his Majesty to take into consideration the validity of a bill which was obviously illegal. The Lords in the Ministry alleged there was no occasion for this address, as the bill was before the Attorney and Solicitor-Generals, and would be rejected by the Privy Council of course. The method of proceeding with American bills is briefly this:—They come over to the Secretary of State, who lays them before the Board of Trade, who generally refer them to the Attorney and Solicitor-General, who report their opinion to the King in Council, who either approve or reject them. Some were inclined to censure the Governor who passed the bill, but the generality were of opinion that he had acted with great propriety and spirit during the whole contest about the Stamp Act. Some reflexions were thrown upon the Ministry, as if they had been dilatory in this matter, which they, on their part, endeavoured to wipe off. All seemed disposed to do everything that could conduce to bringing the colonies back to their duty; and a hint was thrown out as if some plan was in agitation with the Ministry which would be laid before the House in due time. Lord Mansfield, in a very pathetic speech, set forth, with his usual force and eloquence, the necessity of a strict union between this country and the colonies; that he was for supporting the legislative authority of Great Britain over them, by all possible methods, under every administration; that unanimity among ourselves, and vigour in the Ministry, was never more wanted; that, if ever so many independent governments should shake themselves loose from their mother country, the consequence would be first fatal to themselves, by their either falling a prey to one another or to some foreign invader; that we should feel it next in our trade and manufactures; and that during whatever administration this deplorable event should happen, it would be but a poor consolation to the subsequent Ministry that the colonies were lost to this country by their predecessors. As for the act in question, he thought a bare refusal of it in the ordinary course was treating it too mildly, and that some greater marks of resentment and indignation ought to be set upon it—with much more to the same purpose, which I am not able to recollect, and which, indeed, there would be no end in repeating. The House divided, and by a majority of about two to one it was carried against presenting the address. The speakers were—Duke of Bedford, Duke of Richmond, Duke of Grafton, Lords Northington, Halifax, Shelburne, Hillsborough, Weymouth, Suffolk, Lord Chancellor, Mansfield, Sandys, Talbot, Townshend, Botetourt, Cathcart, and Lyttleton. I forgot to mention that Lord Mansfield was strongly for presenting the address, since it had been proposed, that it might not appear upon their Journals that the House postponed, or refused to enter warmly into, a matter so essential to the very being of the British empire."

The second letter is without a date, but the proceedings of which it gives an account appear to have taken place on the 16th of April, which would be a Wednesday, and was one of the days on which the House sat as a Committee of Ways and Means. The writer says—"On Wednesday I heard the budget opened by the Chancellor of the Exchequer, which he did, in my humble opinion, in a very masterly manner. His speech was a full hour in length, and was delivered with great decency, perspicuity, and force. He appeared to have taken some pains in the execution of his office, which is the more meritorious in him, as, you know, he was pressed into the service, and hath for some time, for what reason I know not, seemed uneasy in his situation." A detail is then given of the financial arrangements proposed in the speech, which it is unnecessary to transcribe. In noticing some of the observations which the speaker made as he went along, the writer of the letter says—"Among the sums unappropriated was 90,000*l.*, the balance of Lord Chatham's account when he left the place of Paymaster of the Forces. He said that noble Lord had pressed the settling his accounts, with a view, probably, of setting a good example to his successors in office; and added some encomiums upon him on that score, which he bestowed with seeming candour. . . . He spoke with modesty of his own abilities, hinted at his inexperience, and did not offer to throw the smallest reflexion on any of his predecessors in office. G. Grenville, you may be sure, was present, and I thought he seemed to sit abashed at the superior figure which Mr. Townshend made, when compared to the prolix, verbose, and perplexed manner in which he had delivered himself on the like occasion. I will not enter further into the comparison of these two men, as you know them both better than I do. . . . He insisted likewise, very properly, on the expediency and necessity, during times of peace, of discharging part of our enormous debt, and for that end the endeavouring to ameliorate the public revenue, and retrenching the vast and increasing expense of our peace establishment, in order to provide for a state of war when that should become unavoidable! He observed that the charges of several services were of late years much enhanced, and particularly instanced the navy, which being a popular service was less attended to, and least apt to be grudged; but, he said, for that very reason—*because it was popular*—it ought to be narrowly looked into, and recommended it warmly, both to the Boards of Treasury and Admiralty, to have a watchful eye to prevent unnecessary exceedings in that or any other department. In the course of this excellent speech he observed that our trade in general was by no means upon the decline, which he proved by comparing the produce of the customs for some years past with that of the like number of years preceding the last war; that the revenue of the British empire was very great, including the American revenue, which he should never lose sight of. In short, says he, this country is a mine of resources; but to avail ourselves of this happy situation, it is necessary that we should lay aside all party prejudices, and unite in the public service; that men of the greatest consideration and ability ought to be called forth—men whose ancestors were the deliverers of this country, and who are themselves equal to the trust; that an able and permanent ministry might at length be formed—such a ministry as the people might look up to with confidence, Europe with respect, and America with obedience. Had I been able to do him justice in this imperfect detail, you would have clearly discovered that he equalled his predecessor, Mr. Legge, in point of accuracy and precision, and in his knowledge of the finances, and that in point of genius he surpassed him. What a pity is it, therefore, that the natural fickleness of his disposition (a failing which he frequently mentions him-

self; and did in this very speech) should deprive his country of the full benefit of his singular talents."

There can be no question that Charles Townshend had more than one undisclosed project in his head when he delivered this speech, and that various passages of it were artfully turned so as to prepare the way for the accomplishment of what he aimed at. His remark about not losing sight of the revenue to be derived from America was an ominous intimation; but his more immediate object, and that nearer his heart, no doubt, was his own elevation to the head of that "able and permanent ministry" which he contended ought at length to be formed from among the persons of greatest consideration and ability that the country contained. His own descent from the second Viscount Townshend, the minister of George I., whose grandson he was, explains his pointed allusion to the "men whose ancestors were the deliverers of this country."

To these ambitious views the continued illness of the Premier offered the most flattering prospects of success. On the 5th of May we find Lord Chesterfield writing—"Things are here in exactly the same situation in which they were when I wrote to you last. Lord Chatham is still ill, and only goes abroad for an hour in a day in his coach. The King has, to my certain knowledge, sent him repeated messages desiring him not to be concerned at his confinement, for that he is resolved to support him, *pour et contre tous*." Under date of the 1st of June, he says—"Great changes are talked of, and I believe will happen very soon, perhaps next week, but who is to be changed for whom I do not know, though everybody else does. I am apt to think that it will be a mosaic ministry, made up *de pièces rapportées* from different connexions." One of the figures in Burke's description of Lord Chatham's ministry, which we have quoted above, is supposed to have been suggested by this expression. Lord Chesterfield's Letters were published in the same year (1774) in which Burke's speech was delivered.

It was on the 2d of June that Mr. Townshend appears to have brought forward those fatal resolutions imposing duties upon glass, paper, tea, and certain other articles imported into America, which instantly rekindled in the colonies the flame of insurrection, and eventually led to their separation from the mother country. But in the accounts that have been preserved of the parliamentary proceedings of this session, the manner in which these most important propositions were received is not so much as noticed. It is understood, however, that the scheme of raising, in this mode, a revenue from America, was suggested by Mr. Townshend himself, and was resolved upon by the rest of the Ministers, without Lord Chatham, the nominal head of the Cabinet, having been even consulted. "As if it were to insult as well as to betray him," says Burke, "even long before the close of the first session of his administration, when everything was publicly transacted, and with great parade, in his name, they made an act declaring it highly just and expedient to raise a revenue in America. For even then, Sir—even before this splendid orb was entirely set, and while the western horizon was yet in a blaze with his descending glory, on the opposite quarter of the heavens arose another luminary, and, for his hour, became lord of the ascendant."

It is said that Charles Townshend was supported in his views of placing himself at the head of affairs by General Conway; and that the two accordingly had opened a negociation with the Rockingham party, with the immediate object of effecting, with their assistance, the removal of the Duke of Grafton from his place of First Lord of the Treasury. Lord Chatham's return from Bath, however, interrupted the prosecution of this design, and an apparent reconciliation took place between Mr. Townshend and the Duke.

On the 1st of July we find Lord Chesterfield writing—"Ministerial affairs are still in the same ridiculous and doubtful situation as when I wrote to you last. Lord Chatham will neither hear of or do any business, but lives at Hampstead, and rides about the heath: his gout is said to be fallen upon his nerves."

On the 2d of July the Parliament was prorogued to the 31st of August, from which day it was afterwards further prorogued to the 24th of November.

The interval that elapsed before the re-assembling of the legislature was a time of busy negociation and intrigue. Lord Northington and General Conway having both expressed a strong desire to resign—the former on the plea of infirm health, the latter from a growing wish to rejoin his former friends now in opposition—the King, a few days after the rising of Parliament, wrote, with his own hand, a letter to Lord Chatham, asking his advice in regard to the changes that had become necessary. To this application his Lordship returned merely a verbal answer, "That such was his ill state of health that his Majesty must not expect from him any further advice or assistance in any arrangements whatsoever."

It was now generally understood that the administration was to be considered as broken up, by the abdication of him who had been hitherto regarded as its chief. In this state of things cabals were formed, and conferences held, in various quarters. It is said that, in the first instance, a slight movement was made by Lord Bute, assisted by Lord Holland, with the object of replacing himself in his former position in the state. The more strenuous efforts, however, to obtain possession of the government were made by the leaders of the regular opposition—the Newcastle, and the Rockingham, and the Bedford interests. The Duke of Newcastle was particularly active in drawing these several parties into as close a union as possible. Meanwhile the Duke of Grafton was desired by his Majesty to open a negociation with the Marquis of Rockingham; and, accordingly, at the second of two conferences which these two noblemen held together, his Grace offered the Marquis, in the King's name, his own place of First Lord of the Treasury. Lord Rockingham's reply was, that he must consult his friends; and he immediately proceeded to Woburn to confer with the Duke of Bedford. This was on the 11th of July. The Duke expressed himself willing to acquiesce both in the appointment of the Marquis as Premier, and in his own exclusion from the Cabinet; but he insisted that some of his friends should be taken in. Lord Temple and Mr. Grenville being afterwards consulted, expressed themselves in similar terms; as did also the Duke of Newcastle. These propositions, having been communicated to the Duke of Grafton, were laid by his Grace before the King. In two days an answer was returned, "That his Majesty adopted and approved the idea of a comprehensive system, and hoped it was not meant to exclude his friends and those about his person." In consequence of this answer, a meeting was held at Newcastle House, at which were present the Dukes of Newcastle, Bedford, Richmond, and Portland, the Marquis of Rockingham, the Earl of Sandwich, Viscount Weymouth, Mr. Dowdeswell, Mr. Rigby, and Admiral Keppel. The several associated parties now for the first time proceeded seriously to discuss what should be the policy of the administration to be formed from their union. The Duke of Bedford, along with Lord Temple and Mr. Grenville, had, when first consulted, stated it as one of the conditions of the support they should give to the new government, that whoever were ministers should assert and establish the supremacy of Great Britain over America. A letter was now read from Mr. Grenville, promising his support, provided the dependence and obedience of America was *asserted* and *maintained*. To these expressions Lord Rockingham objected; and after some debate, an apparent agreement was effected by the substitution of the words—"that the authority of Great Britain over America should be supported and established," for those used in Mr. Grenville's letter. The really opposite views, however, of the two parties were not to be thus reconciled; and the difference broke out again, when, from discussing proposed measures, the meeting proceeded to fix upon the men who were to execute them. No objection was made to Lord Rockingham's nomination of himself for the place of First Lord of the Treasury, and of Mr. Dowdeswell for that of Chancellor of the Exchequer; but when he proposed that General Conway should continue to be one of the Secretaries of State, and take the management of the House of Commons, the Duke of Bedford positively refused to assent to that arrangement. His Grace insisted that these offices should be given to his own friend, Mr. Rigby. On this the meeting broke up. Another conference, which was held a few days afterwards, ended in the same manner.

Notwithstanding what had taken place, the Marquis of Rockingham still refused to place himself at the head of the government without the support of the Bedford party. In these circumstances, it is probable that Charles Townshend would have been eventually appointed Premier. He showed his power by getting his brother, Viscount Townshend, (afterwards the Marquis Townshend,) raised to the

office of Lord-Lieutenant of Ireland, and by procuring a peerage for his wife, who was, on the 28th of August, created Baroness of Greenwich, with remainder to her issue male by her present husband. On the 4th of September, however, Mr. Townshend was suddenly cut off by an attack of putrid fever, in the forty-second year of his age.

On the 24th of November Parliament re-assembled pursuant to the prorogation, when the Address was carried in both Houses without a division. In the meantime the office of Chancellor of the Exchequer had been again committed to the Chief Justice of the King's Bench, Lord Mansfield, till a permanent appointment could be made. The place was offered, in the first instance, to Lord North, and, upon his declining it, to Viscount Barrington, by whom it had been held during Mr. Pitt's second ministry in 1757, and who was now Secretary at War. His Lordship, however, recommended that Lord North should be again applied to; and eventually the latter was prevailed upon, by the persuasion, it is said, of the Princess of Wales and his father, the Earl of Guildford, to accept the appointment. Lord North appears to have been appointed Chancellor of the Exchequer on the 1st of December. Mr. Thomas Townshend (afterwards Viscount Sydney), a cousin of the late Mr. Charles Townshend, succeeded his Lordship as Joint Paymaster of the Forces; and Mr. Townshend's place as one of the Lords of the Treasury was given to Mr. Charles Jenkinson, afterwards Baron Hawksbury and Earl of Liverpool. All these arrangements are said to have been made without the least communication with Lord Chatham.

Previous to the appointment of Lord North to the Chancellorship of the Exchequer, a negociation had been ineffectually attempted with the Duke of Bedford through the medium of Lord Mansfield. Lord Northington and Mr. Conway still persisting in their wish to retire, the support of his Grace was again sought by ministers on an offer of nominating two of his friends to the situations that would thus become vacant. Accordingly, on the 19th of December, Earl Gower became President of the Council in the room of Lord Northington, and on the 20th of January, 1768, General Conway was succeeded as one of the Secretaries of State by Viscount Weymouth, afterwards Marquis of Bath. On the same day the Earl of Hillsborough, afterwards Marquis of Downshire, was appointed to the new office of Secretary of State for America. Lord Hillsborough was succeeded as Joint Postmaster by the Earl of Sandwich. General Conway, on leaving the Cabinet, was appointed to the office of Lieutenant-General of the Ordnance, which had been vacated by Viscount Townshend.

The Ministry thus reconstituted took henceforth the name of the Duke of Grafton's Ministry. Mr. Thackeray states, that while the arrangements were in progress, Lord Chatham, who had gone to Burton Pynsent, his estate in Somersetshire, returned to Hayes, but in such a state of health as still entirely incapacitated him for business. On the 19th of December, Lord Chesterfield writes from Bath—"His physician, Dr. ———, as I am told, had very ignorantly checked a coming fit of the gout, and scattered it about his body. It fell particularly upon his nerves, so that he continues exceedingly vapourish, and would neither see nor speak to anybody while he was here." On the 29th of January, 1768, his Lordship again writes—"Lord Chatham is at his house at Hayes, but sees no mortal. Some say that he has a fit of the gout, which would do him good, but many think that his worst complaint is in his head, which I am afraid is too true." On the 2nd of February, three commissioners were appointed to execute his office of Keeper of the Privy Seal for six weeks. The seal was redelivered to his Lordship on the 21st of March. The session, during which the principal subject of discussion had been the affairs of the East India Company, terminated on the 10th of March, and two days after the Parliament was dissolved.

It was at the general election which followed, that John Wilkes, having suddenly returned from France, where he had resided since his outlawry, was, after being thrown out in the city of London, returned by a large majority as one of the members for the county of Middlesex. This was on the 28th of March. Immediately after his election he made his appearance in the Court of King's Bench, when the question of his being committed on his sentence of outlawry was discussed. He was eventually ordered into custody, but it was not till he had been first rescued by the mob, and had made his escape from them, and surrendered himself, that he was at length safely lodged in the King's Bench prison. The vicinity of the prison became from this time the scene of daily and nightly riots, during which it was more than once found necessary to call out the military.

The new Parliament met on the 10th of May. On this day the populace assembled in St. George's Fields in great force, with the determination of getting possession of Wilkes, and conveying him in triumph to the House of Commons. A dreadful tumult ensued; the Riot Act was read, or rather attempted to be read; and the soldiers having been ordered to fire, five or six persons were killed, and about fifteen wounded.

The session of Parliament lasted only till the 2nd of June. During the whole of it the standing order for the exclusion of strangers was strictly enforced in both Houses. No subject, however, of much interest or importance came before either. In the Commons a motion was made—"That the proper officer of the Crown do inform this House why the laws were not immediately put in force against John Wilkes, Esq., an outlaw, when he returned to this kingdom in February last;" but the House did not choose at that time to enter into the matter, and the question was got rid of by a motion that the House should adjourn, which was agreed to without a division. The prorogation of Parliament, which was in the first instance to the 21st of June, was afterwards extended to the 8th of November.

Before that day arrived, a farther change took place in the composition of the ministry. The French government having purchased the island of Corsica from the Genoese, had proceeded to take possession of the country, in opposition to the resistance of the inhabitants, by force of arms. A remonstrance against this conduct was addressed to the French minister, the Duke de Choiseul, by the English ambassador at Paris, Lord Rochford, "in consequence," as Mr. Burke asserts in his 'Thoughts on the Cause of the Present Discontents' (published in 1770), "of a direct authority from Lord Shelburne." "This remonstrance," continues Mr. Burke, "the French minister treated with the contempt that was natural, as he was assured, from the ambassador of his court to ours, that these orders of Lord Shelburne were not supported by the rest of the (I had like to have said British) administration. Lord Rochford, a man of spirit, could not endure this situation. The consequences were, however, curious. He returns from Paris, and comes home full of anger. Lord Shelburne, who gave the orders, is obliged to give up the seals; Lord Rochford, who obeyed these orders, receives them. He goes, however, into another department of the same office, that he might not be obliged officially to acquiesce in one situation, under what he had officially remonstrated against in another." In fact, William Henry, fourth Earl of Rochford, became Secretary of State in the room of Lord Shelburne, on the 21st of October. At the same time a much greater name, though now a name and no more, was withdrawn for ever from the King's government. "I have already expressed my astonishment," says Mr. Thackeray, "that Lord Chatham should so long have consented to form a part, even nominally, of an administration whose sentiments and proceedings were so opposite to his own. It is probable that he had hoped to recover sufficient bodily strength to enable him once more to come forward and exert himself for the public good; but whatever were heretofore his motives for remaining in office, the recent conduct of the ministry was so gross an outrage upon his feelings, both as they regarded his public measures and his private friendships, that he now felt himself compelled to resign. The spirit of his advice with regard to America had been wholly neglected; Corsica was abandoned to France; and his friend Lord Shelburne was dismissed from office. On the 15th of October, 1768, Lord Camden, on the part of Lord Chatham, resigned the Privy Seal into his Majesty's hands. A greater contrast in the feelings of the Cabinet and of the nation upon the present resignation of Lord Chatham to those which were evinced upon his dismission from office in 1757, and upon his retirement in 1761, can scarcely be imagined. His dismission in 1757 excited one common cry of enthusiastic admiration towards himself, and of indignation towards his political opponents. The attention, not only of Great Britain, but of the whole of Europe, was attracted by his resignation in 1761; and although the voices of his countrymen were not so universally united in his favour as upon the former occasion, the event was considered as affecting the interests of nations in the four quarters of the globe. The resignation of Lord Chatham in 1768 was in fact

nothing more than the official relinquishment of an appointment in which he had long ceased to exercise his authority, or to exert his abilities. "It was expected by the ministry—it was little regarded by the people of Great Britain—it was almost unknown to the Continent of Europe." The office which Lord Chatham had resigned was given on the 2nd of November to George William Harvey, Earl of Bristol. His Lordship had been nominated to succeed the Earl of Hertford as Lord Lieutenant of Ireland, immediately before the breaking up of the Rockingham Ministry in August, 1766, but had never gone over.

REPORTS OF COMMITTEES ON HAND-LOOM WEAVERS' PETITIONS.

One of the most melancholy subjects for contemplation connected with civilized society, is the distress occasioned by the constant fluctuations experienced in the demand for labour in particular branches of industry. Improvements in machinery, the caprice of fashion, and a variety of other causes, are constantly tending to produce these changes; but however deeply the distress thus occasioned may be deplored, no adequate remedy for it has yet been discovered. Certain most fallacious and pernicious doctrines bearing upon the subject are sometimes broached by persons who, in seeking to remedy the one particular evil under discussion, do not look beyond at the wide spreading misery their proposed measures could not fail to produce. The case of the hand-loom weavers affords a melancholy instance of the misery to which the working classes may be thus subjected. This body comprises, according to the best computation, 840,000 individuals. The inquiry whether any means can be adopted for ameliorating their condition has occupied the attention of select committees of the House of Commons during the last and present sessions. The Reports of these committees, together with the minutes of evidence taken before them, comprise two very bulky volumes; one of these was printed in August last, and another has only very recently been delivered to the members. It is to be regretted that these reports do not afford any very strong proof of enlightened and enlarged views on the part of their authors, and that they do not suggest any reasonable measures by which the particular distress under investigation may be alleviated without injury to the public, or injustice to any other class. The subject naturally divides itself into three heads: the amount of distress, the causes by which it is supposed to be occasioned, and the remedies by which it is proposed that it should be met.

The following extracts (from the evidence) will sufficiently show the state of privation and misery to which this numerous class of artisans is at present reduced:—

"What is the condition of the operatives (in Glasgow) as to wages and their circumstances?—Their condition is extremely poor in that respect, both with regard to food and clothing. Have they worse food and clothing than they used to have formerly?—Yes, considerably so. When they had possibly three or four times the wages they have at present for the same fabric, of course they must necessarily be able to purchase more of the necessaries of life, food and clothing included. Have they worse furniture?—Their furniture is in a great measure run out, and they are certainly not able to purchase new furniture at the present time. And their houses, taking them in general, are extremely poorly furnished. Do they attend public worship as much as they did formerly?—Ever since their condition has deteriorated they have in a great measure lost heart; and because they have not the same outward look as other tradespeople they generally stay at home, or take skulking walks in the country to get out of sight." Mackenzie, 1st Report, p. 41.

The answers of numerous other operatives to these questions are to the same effect. James Orr, a silk gauze weaver, states—"When I was young it was quite common for a hand-loom weaver to lay in as much meal, potatoes, cheese, and butter in harvest, as would serve till spring, and coals were laid in in larger quantities; and very commonly hand-loom weavers salted meat at Martinmas for winter. Now, it requires the clubbing of all the little earnings of the family on a Saturday to make provision for the ensuing week. And with regard to intemperance, that has increased much in Paisley; my opinion is that it is from poverty also. Twenty or thirty years ago young men and women would never have thought of entering into the marriage state without some provision for housekeeping; now, wages are such that the conclusion come to, after due consideration, is generally this: If we are to wait till we have something laid up, we must wait for ever; thus connexions are formed early and inconsiderately." 1st Report, p. 61.

In the evidence of Mr. Makin, of Bolton, it is stated that the weavers are labouring under the most incredible privation although they are fully employed, every hand having been engaged during the last three or four years; that they do not earn a sufficiency to procure them meat, except occasionally, not more frequently than once in the week; that their ordinary food is oatmeal and potatoes; that a man having a family of five children cannot, with the assistance of his wife and two of his children, earn more than 2½*d.* for each per day applicable for food and clothing. Mr. Makin continues—"I cannot recollect any instance but one where any weaver of mine has bought a new jacket for many years, and I am only sorry I did not bring one or two jackets to let the committee see the average state in which they are clothed."—1st Report, p. 388. He adds, "that as to bedding they have scarcely any, and of other furniture less; they are generally without chairs, having nothing but two or three stools to sit on."—p. 5. It is stated in the Second Report, from calculations made by Mr. Ashworth, a woollen manufacturer of Manchester, "that out of the earnings of a weaver and his family, 9*s.* per week remain for clothing, bedding, and food for eight persons." Further, he (Mr. Ashworth) has found that charity debased the objects of it, and made them cringing sycophants; that the morals of the people were greatly influenced by their distresses, and that they have become intemperate and neglectful of their religious duties; that their homes exhibit no appearance of comfort, being almost totally destitute of furniture, and the inmates frequently lying upon straw.—p. vii.

David Shaw, a weaver at Nuneaton, states that nine-tenths of the population of Nuneaton are dependant on the silk trade, and that they are in a state of unutterable distress, even now with plenty of work to do. "I myself," he says, "have got almost if not quite three times as much per week personally as I can get now, working the same number of hours upon the same article. If I had nothing to do now, and there is an article I have been at work upon since Christmas and have had plenty to do—if I had nothing to do now but to work at that loom alone, I should work very hard to get 4*s.* 8*d.* per week."—p. 251. The distress of the weavers does not seem to be confined to any particular district, or to depend on the particular fabric manufactured, but is diffused throughout the United Kingdom, and is thus described in general terms from the evidence of Mr. Fielden. "It will be seen on reference to the evidence that a very great number of the weavers are unable to provide for themselves and their families a sufficiency of food of the plainest and cheapest kind; that they are clothed in rags, and indisposed on this account to go to any place of worship, or to send their children to the Sunday schools; that they have scarcely any thing like furniture in their houses, their beds and bedding are of the most wretched description, and many of them sleep upon straw. Notwithstanding their want of food, clothing, furniture, and bedding, they for the most part have full employment: their labour is excessive, not unfrequently sixteen hours a day: this state of destitution and excessive labour induces them to drink ardent spirits to revive their drooping powers and allay their sorrows, whereby their suffering is increased. Their poverty and wretchedness cause many to embezzle and sell the materials entrusted to them to be worked up; and to such an extent has this now gone that there are now notoriously receiving houses at which the weavers can exchange such embezzled materials for spirits, victuals, and money; and there are manufacturers who buy of these receivers the principal part of the weft which they manufacture; thus destroying the morals of the weavers, the tradespeople with whom they deal, and even of the manufacturers themselves."—p. 1.

The best and fairest means of judging, however, of the actual facts, are to be obtained by examining the rates of wages at respective periods. Upon this part of the subject we give the following extract from the Second Report:—

"It appears that the wages of the hand-loom weavers have been reduced generally since 1815 to one-half or one-third of the wages paid at that period, and that the sums reduced were largest in 1816, 1817, 1826, and 1829. The weekly wages a fair average weaver can now earn at

the work a majority of the weavers are employed on, is stated in the evidence of weavers, manufacturers, and other witnesses, to be as follows:—

"At Aberdeen, 3*s.* 6*d.* to 5*s.* 6*d.* net; Bolton, 4*s.* 1½*d.* net; Dundee, 6*s.* to 7*s.* net; Forfar, 6*s.* net; Glasgow, 4*s.* to 8*s.* gross; Huddersfield, 4*s.* 6*d.* to 5*s.*, a few 16*s.*; Lanark, 5*s.* 1*d.* net; Manchester, 5*s.* to 7*s.* 6*d.* net; Paisley, 6*s.* to 7*s.* gross; Perth, 4*s.* 9*d.* to 7*s.* 9*d.* net; Preston, 4*s.* 9*d.* to 6*s.* 6*d.* gross; Spitalfields, 7*s.* 6*d.* to 8*s.* gross; Stockport, 9*s.* gross; Coventry, 7*s.* 6*d.* net; Nuneaton, 4*s.* 8*d.* net; Drogheda, 2*s.* 4*d.* to 4*s.* net; Belfast, 3*s.* 6*d.* to 6*s.* 6*d.* gross."—p. xii.

The average earnings of 657 weavers of different classes at Leeds were found by Mr. Baines to be, for the first class, men, 11*s.* 3*d.*; women, 5*s.* 9*d.*; boys, 7*s.* 3*d.*; girls, 5*s.* 9*d.*; but that these have employment during ten months in the year only. For the second class, men, 8*s.* 6*d.*; women, 5*s.*; boys, 5*s.*; but that these are employed during six months in the year only. The following statement shows the relative proportion of wages to the cost of the necessaries of life through a period of more than thirty years. "From 1797 to 1804 a weaver could earn 26*s.* 8*d.* per week, which would buy him 100 lbs. of flour or 142 lbs. of oatmeal, 826 lbs. of potatoes or 55 lbs. of butchers' meat; which would give a general average of a relative proportion of these articles of 281 lbs.

	s.	*d.*		lbs.
From 1804 to 1811 wages	20	0	general average of food,	238
1811 „ 1818 „	14	7	„ „	131
„ 1818 „ 1825 „	8	9	„ „	108
„ 1825 „ 1832 „	6	4	„ „	83
„ 1832 „ 1834 „	5	6	„ „	83

"This diminution in the command of food is not the only ground of the weaver's complaint; there is also his rent; and a short statement will suffice to show the number of pieces that he has at different times been obliged to weave in order to pay it. Your committee, unable to arrive at a certainty as to all his outgoings, will take this important one by way of illustration. In the first seven years the wages for weaving six pieces would pay his rent; in the second seven years it required him to weave nine pieces; in the third seven years, twelve and a third pieces; in the fourth seven years, sixteen pieces; in the fifth seven years, twenty-two pieces; in the two last years, twenty-five pieces."—p. xiii.

The following statement shows the average earnings and required expenses of a journeyman weaver, who, according to the evidence, performs as much labour as any other person employed in the cotton trade per week. 6/4, 60 cambric, 5*s.* 6*d.* per cut, is a week's work. Out of this his employer takes a fourth for necessary expenses, which leaves the weaver 4*s.* 1½*d.* to purchase food, clothing and lodging.

	s.	*d.*
For lodging he has to pay (per week)	0	9
Washing and cooking	0	3
Porridge	0	6
Potatoes	0	6
½ lb. sugar	0	3
1 lb. butter	0	4½
1 lb. bread per day	0	10½
Tea or coffee	0	2
Milk	0	4
Butcher's meat, 1½*d.* per day	0	9
Looming his warp, &c.	0	3
Candles to work by	0	3
Tobacco	0	2½
	5	5½

So that he is 1*s.* 4*d.* in debt after he has performed a full week's work sufficient for any man, and for which he ought to have a living; there is nothing left for clothes, so that he must go naked, unless some friend or other gives him some to cover him."—*Report* 1, p. 441.

In the evidence of a Belfast weaver a statement is given of the various items required for the support, at the lowest rate, of a family consisting of a man, his wife, and two children, including coals, candles, and soap; the whole amounts to 6*s.* 5½*d.*

In subjoining the following extracts, it is not our intention to impugn the above evidence, or to endeavour to gloss over an evil which cannot, unhappily, be disproved; but it is right to give an impartial view of the case; and it is also a little consolatory to have some slight foundation on which to build a hope that the amount of misery is not perhaps quite so great or so general as the above cheerless accounts would shew, and that where there are uniform industry and temperate habits, the condition of even the hand-loom weaver is not so utterly destitute and hopeless as it would at first seem.

"What is the state of hand-loom weaving in Manchester at present?—Better than it has been for the last two or three years. When did the improvement begin?—The early part of October or November last. Do you attribute that improvement to any particular cause?—Not any farther than the demand has been greater. Is it an export demand, or home?—Principally export, I should say: an American demand; it is the time of year they purchase, and from the peculiar state of their finances last year they did not purchase the usual quantity, and I think have purchased more than the usual quantity this season. . . . . Do you think that improvement is likely to be continued?—Yes . . . . Are the wages of the weavers higher in consequence of this late improvement than they were last year?—I think they are, on the whole; I think weavers' wages, generally speaking, are higher than what they were the early part of last year."—p. 126 (Mr. Gardner.) "Take the average of men who work pretty steadily, and who are perhaps seventeen or eighteen years of age, what do they earn per week?—I should think that men who would weave sixty hours a week (good weavers) may get from 10*s.* to 13*s.* per week."—p. 130. "I put in an account of wages taken from our book indiscriminately; I also requested my overlooker to give me particular cases of country families. There are one or two of those I should beg to put in. One is the case of James Bradshaw, of Penworth, near Preston. He has three sons, seventeen, nineteen, and twenty-one years; he has two daughters, eighteen and twenty-four, whose average earnings, for the last twenty-one weeks, are 43*s.* Another country weaver, Peter Forrest of Goosnaigh, a family of ten persons, of whom six are weavers, who average 8*s.* each, besides taking care of three cows. Richard Rigby, Whittingham, six in family, ages from sixteen to twenty-six, five of them weavers; earnings 42*s.* per week."—p. 170. "What is the state of hand-loom weavers generally in the neighbourhood of Coventry?—At this moment that portion working in engine-looms are very well off, but that portion who work at single-hand-looms are paid very low. What do you mean exactly by being well off; what average earnings do you consider to be well off for the weaver?—They have now full employment, which is a material point; they can earn from 10*s.* to 30*s.* or 40*s.* a week. Each person?—Yes. How long have they been able to earn these wages?—When fully employed, for many years past. . . . . Are you aware that the testimony then, (1818,) was that the average gains of the hand-loom weavers did not exceed 5*s.* 6*d.* a week, in which both master and man concurred?—In some years there has been an extraordinary depression of wages; in 1818 there was one; in 1819 there was a list formed, and in that year it was not so low. The highest wages given for the average rate of engine loom weaving was stated by the weavers to be under 10*s.* I believe it was under-stated: there is a strong feeling upon the subject always exhibited. Taking your impression generally, do you think that the state of the hand-loom weaver was better or worse before 1824 or since 1824?—Better since. Do you mean that they earn more per week since 1824?—Yes, from the circumstance of the Jacquard-loom being introduced, that affords high wages. Do you think they are able now to command as many of the necessaries and comforts of life as before 1824?—Yes. And they are contented in their situation?—Yes."—p. 265. (Mr. Jenkins.) In the evidence given by Mr. Milner, a manufacturer at Huddersfield (p. 57), he states that industrious weavers can earn 15*s.* per week, and that he thinks they have as much furniture and are as well clothed as they used to be. Mr. Moncrieffe, manufacturer of muslins at Belfast, says (p. 109), that the last year and a half has been an extremely brisk time for the weavers.

The following statement shows the effects of bad customs, which often work to the detriment of the most temperate.

"*Harness-tying.*—This is a particular kind of mounting for raised or flowered work. On this occasion the weaver collects a number of his neighbours and acquaintances to assist him; and as there is no payment for this kind of work, a treat of bread and cheese and plenty of whiskey is

the acknowledgment. As the weaver's trade is regulated this usage takes place at night, and the consequence of this kind of reciprocity perhaps from some of the party, is that some are not in a capacity for working next day. This usage is so imperative that one individual dare not abandon it. We have however succeeded in procuring the abrogation of more inveterate usages by combination."—p. 27.

We now come to the *causes* of the distress. Upon this part of the subject there is great diversity of opinion among the witnesses, as will appear by the following extracts from the evidence:—

"It is allowed by all that the immediate cause of this distress has been unfair reduction of wages, by a few manufacturers in the first instance, but of necessity adopted by others who had a strong aversion to it, whereby has resulted reduction after reduction, and the present state of things." —p. 2 (Mr. Fielden.) "I assign the cause mainly to the uncontrolled and extended application of mechanical power; that is the first great cause of the depression."—p. 28. "It has always been considered by the intelligent hand-loom weavers that the repeal of the duty on printed cottons was just giving the power-loom weaver a bonus at the expense of the pullicate and gingham department."—*Report* 1, p. 211. "We have paid particular attention to that for many years, and we certainly do attribute the sufferings principally to the unprincipled competition amongst the manufacturers at home."—*Report* 1, p. 41.

The following statements, made by Mr. Gardner, are worthy of attention, and perhaps offer a sufficient explanation of the causes of the distress:—"You think the power-loom one main ingredient in the cause of the reduction of the hand-loom weavers' wages?—No question about it; there cannot, I think, be two opinions about it. Does the power-loom affect every species of hand-loom weaving?—Not hitherto, because there is every year a very great demand for those fabrics on which the power-looms are at present employed, therefore no power-loom weaver has occasion to look about for any fresh fabric; but at this present moment there is every prospect of being a very large increase of power-looms, that I think the fabrics that are at present worked by power-looms will be overdone, and every power-loom weaver will be led to look upon what other fabrics he can bring the power-loom to bear upon; and I would give it as my decided opinion, that three-fourths of all the various fabrics of cloths woven at present by hand-loom weavers may be woven by power. Do you mean by power as it now exists, without any added improvements?—There are improvements in power-looms almost every week; and I think one half at least of the whole of the different fabrics now wove by hand will be wove by power-looms, either as they at present exist, or by other machinery. . . . . There are some departments of weaving with which the power-loom cannot come into competition?—It does not at present. Can you at all account for those departments of the trade with which the power-loom cannot come into competition not being in a better state than the hand-loom weavers with whom the power-loom does come into competition?—I think the fancy goods which the power-loom would have the greatest difficulty in competing with, are perhaps better paid than those it does more easily compete with. Then if the competition of power-loom with hand-loom be one main ingredient in the cause of the reduction of the wages of the hand-loom weavers, they ought to be much worse off than those weavers with whom power-loom does not come into competition?—No; because if one description of work is paid lower than another, they then fly to other sorts; weavers can weave various descriptions of cloth; if one thing is badly paid there is something perhaps within his reach that is better paid, and he goes to that. . . . . Is it a fact within your knowledge that the weavers in the department of the weaving trade with which power-loom does not come into competition have increased of late years?—Yes, they must have increased, because such a very great proportion of the various fabrics that were formerly wove by hand are wove altogether by power at present; I apprehend fustians, which at one time employed a great many—I cannot speak exactly to the number, perhaps 6000, or 7000, or 8000 hand-loom weavers; and I should think—of course I speak very much at guess, but I should think there are not 200 hand-loom fustian weavers now in the whole county of Lancashire. I spoke to a gentleman interested in the trade on Saturday from Heywood: he stated formerly they had about 3000 hand-loom fustian weavers; then I pressed him very much to guess at the quantity now. I said, 'Do you think there are twenty now?' and he said, 'I can tell you one thing, I should be sorry to be compelled to find six before I go to bed.'"—pp. 128, 129. . . . . "I stated that a weaver can support his family, I should suppose, in those countries (Switzerland and Saxony) at a third, or perhaps one-quarter the same expense he can do here; I think the foreign weavers are also more patient and pains-taking weavers; they absolutely produce better cloth than we do, out of inferior materials. But at a higher cost? No, I apprehend, not at a higher cost, they have a higher yarn to work it, but then there is a greater difference in their wages, or maintenance than there is in the price of the yarn. They begin to interfere with us in many of our foreign markets." —p. 135. . . . . "I stated that the present season the Dutch and Belgian buyers and the Germans have ceased to buy several fabrics of cloth from my house that they have been in the habit of buying every previous year; and they say, 'We can buy these goods cheaper from the Swiss or the Saxon manufacturers.' They show samples of what they are purchasing, and they say, 'If you can charge them as low as this, we will still buy them of you;' but we cannot, they undersell us."—p. 165.

In the 5th resolution, passed at a meeting of deputies from the hand-loom worsted weavers of Bradford, Leeds, and Halifax, and adjacent parishes, held at Bradford in March, 1835, we find among the causes which are considered to have been productive of the present distress, the following:—

"A ruinous foreign trade." "The unrestricted use (or rather abuse) of improved, and continually improving machinery, especially of steam or power-looms, as well as combing machines." "The adaptation of machines in every improvement to *children* and *youth* and *women*, to the exclusion of those who ought to labour—the men." The following are the 6th and 7th resolutions in this curious document:—

Resolved, 6th—"That to fill a country with inanimate and non-consuming machines, and to drive away the cultivators of the soil, and the consumers of produce to foreign climes, when there are seventeen millions of acres of uncultivated land in Great Britain and Ireland, for the most part capable of being made productive, is a species of combined political folly and cruelty; of folly which a worsted weaver ought to be ashamed, and of cruelty, which barbarians would not, and Christians ought not to practise."

Resolved, 7th—"That this meeting is convinced that no remission of taxes, no reduction of provisions, and no enlargement of political privileges, however desirable, will suffice to uphold the just interests of the labouring classes, in manufacturing parts especially, unless a due and wholesome legislative restraint be placed upon the time of working machinery, so as to prevent the ruinous glutting of home and foreign markets, and so as to keep the human machines in profitable employment."—p. 291.

This passage affords a lamentable proof of the extreme ignorance of the weavers on the subject—ignorance which we had hoped could not have been found among our artizans of the present day. While they have such erroneous views it is quite impossible they can take any but wrong steps towards lessening their distress. They believe the remedy depends upon others and not upon their own exertions, and consider themselves aggrieved because measures are not adopted which, in the end, would be as ruinous to themselves as to the rest of the working classes. Can it be believed that a committee of the House of Commons could admit such a document in their minutes of evidence without one word in their Report tending to convince these misguided people of their errors, and without protesting against opinions so replete with mischief, as well as absurdity? and yet more, can it be possible that they have not only thus given a sanction to these erroneous notions by their silence, but that they have actually put forth as their own doctrines very much of the same character? The following is taken from the Report itself:—

"Of the combination of causes to which the reduction of wages, and consequent distress of the weavers, may be attributed, the following appear to be the most prominent:—1. Increase of machinery propelled by steam. 2. Heavy and oppressive taxation occasioned by the war. 3. Increased pressure thereof from operations on the currency, and contractions of the circulating medium in 1816, 1826,

and 1829. 4. The exportation of British yarn, and foreign competition created thereby, from the increase of rival manufactures abroad. 5. The impulse given by low wages and low profits to longer hours of work."—p. xvii.

An analysis of the different causes, too long for entire insertion, then follows, but it would not be doing justice to the subject, or sufficiently prove what we have advanced, did we not present a few extracts:—

"Your Committee cannot withold their conviction that the bill of 1819, commonly called Mr. Peel's Bill, has been the main cause of the great pressure on industry resulting from the fall in prices.

"Your Committee are not in the least disposed to deny the influence the power-loom has had upon the condition of the hand-loom weaver; but they cannot help lamenting that such should have been the course of our legislation that, instead of breaking the force of this (at its commencement) almost necessary evil, on the hand-loom weaver; and, instead of causing it to be as gradual as possible, it has actually gone out of its way to quicken its progress, and to aggravate to an inconceivable extent the burden and the pressure of it.

"Your Committee cannot but lament that any temporary pressure in the manufacturing interest, subsequent to 1815, should have led to so great an increase in the export of yarn; because, however individually profitable in the first instance, nothing can be more certain than that by encouraging weaving abroad we allow the foreigner to get between the British manufacturer and the market, and so to cut off a lasting source of profitable employment to our fellow-countrymen."—p. xviii.

"The witness observed to your Committee that if the operative manufacturers were properly paid for their labour it would be greatly beneficial to agriculture, by making them greater consumers of agricultural produce; and further, that a repeal of the corn laws would be the ruin of the manufacturer, inasmuch as it would necessarily ruin the shopkeepers who depend on the farmers, and whose ruin would involve that of the manufacturer and his dependents: and your Committee feel themselves bound to observe that many of the witnesses examined by them, especially operative weavers, have concurred in the opinion thus elaborately stated by Mr. Hale on the necessity for the maintenance of British agriculture."—p. xi.

This curious deduction is put forth in the Report without a single comment as to its unsoundness. The real and sufficient causes appear to be that our hand-loom weavers cannot compete with power-looms, which can work much faster in weaving some descriptions of fabric; and that in the weaving of others, where machinery has not yet superseded manual labour, they cannot compete with the foreign weaver, who can work much cheaper. He is altogether a different being, and can dance and make merry on his scanty and coarse fare, while the Englishman sits down in sullen despair under what appears to him almost starvation: or, what is still worse, flies for relief to the gin-shop. It is not at all desirable, on the contrary it is to be deprecated, that such a state of things should be produced as to make the English weaver contented with the privation and poverty of some of the poorer classes on the Continent. Every endeavour should be made to raise him in the scale of being, and make him aspire after an improvement in his condition. It is almost hopeless to suppose that he can, by mere manual labour, compete with the foreigner, and still obtain a larger rate of profit than satisfies the latter. It is only by our improved machinery that we can expect to maintain our position in the foreign market, and therefore to this the attention of our labouring classes should be turned, as the source of their future prosperity. They should be made to understand that machinery is their best friend, instead of being incited by others, who they must suppose have had opportunities of judging better than themselves, to believe that machinery stands in the way of their industry.

One of the witnesses, Mr. Marshall (not of Leeds), proposes to repress the competition of the power-looms by imposing a tax upon them; and several others join in the same *wise* proposition! Many of those who give their evidence seriously propose to restrict the number of hours for working the power-looms, and also the quantity of goods produced by them. How are we to advance if improvement is thus to be made nugatory? The case is well put by Mr. Gardner at p. 161:—"I think, with respect to protection, that the coach proprietors on the Liverpool road might as well apply for an interference of Parliament because the rail-road beat them off the ground. I think also the owners of sailing-boats on the river Thames might also apply for protection against the steam-boats exactly on the same principle, as the cheapest article will always supersede the dearer."

Many other remedies, besides this war against power-looms, have been suggested, most of them upon the principle that a minimum of wages ought to be established. The condensation of the evidence on this subject, as given in the Report, is as follows:—

"The plan proposed by some of the witnesses is, that a *Central Board* of Trade should be established for the purpose of regulating wages, and that the same price should be paid for weaving the same article in every part of the United Kingdom. Others recommend *Local Boards* of Trade, composed of an equal number of masters and workmen; these Boards to have the power of regulating wages from time to time, according to circumstances, by fixing the minimum in their respective districts, so as to prevent individual masters from lowering wages unnecessarily and at pleasure.

"A third plan has been proposed by a member of the Committee, and given in evidence; a leading feature of which is, that returns shall be made of the prices of weaving paid by such a number of manufacturers as, collectively, make one-half of the goods of any description in the parish or township from whence the returns are sent, and the average of the highest prices paid by a majority of such manufacturers, shall be the lowest price to be paid in such parish or township during the succeeding three months."—p. xx.

"I now come to the remedy. The remedy appears to be to create a competition amongst manufacturers, to give good wages by protecting those who are disposed to do so, placing the controlling power of regulating wages in their hands, instead of allowing that power to be, as it now is, in the hands of those who generally take the lead in reducing wages. A plan of taking periodical averages of wages paid for all sorts of hand-loom weaving on which to found a minimum has been suggested to effect this object, as preferable to boards of trade composed of masters and men. The former plan has been discussed amongst the weavers since the Report of the Committee was framed, and has met pretty generally with their approval."—p. 5. "The necessity for legislative interference on the subject seems to us, from all our experience and observation, to be therefore undoubted; and we humbly think that a very simple remedy could be provided for the appalling evil. It is this, that the system of operation by means of minimum rates of payment should be recognised and protected by express statute."—p. 292.

It might easily be proved by reasoning that this minimum of the rate of wages would act perniciously, but it may perhaps be made more distinctly evident by means of the experiment which actually took place at Lyons, and the disastrous effects of which are detailed in the evidence given by Dr. Bowring. To render this statement perfectly intelligible we shall begin by extracting a short account of the society of manufacturers and weavers formed at Lyons, by which it is preceded:—

"There does exist in France an admirable institution founded by Napoleon, which enables the masters and the men to come into friendly contact; it is a representative council formed of masters and men, the masters having a majority of one, and this council exercises certain valuable and important functions in the misunderstandings that take place. It does not establish wages; it is not a tribunal that can be appealed to, to decide what general price ought to be paid for any particular work, but it has the power of interfering to enforce the contracts made between masters and weavers, and a great many points are constantly referred to it as a court of conciliation, and it settles almost every question, other than the question of the average rate of wages, by amicable interference. This council is a representative body, both as respects the masters and as respects the men; and every weaver who has a certain number of looms is an elector to the council. It was believed, when the distress became extreme, that this organization might be extended, and made useful for introducing an arbitrary minimum rate of wages, inasmuch as all the masters were represented and a very large number of the weavers. This tribunal was a highly popular one, and I think something

like it might advantageously be established in this country. Whether it can exercise all the functions that have been suggested by certain honourable members I very much doubt, though sure I am that habitual intercourse between masters and men is a valuable and useful object to be attained, and that it does facilitate the settlement of many questions. In Lyons the weavers and a certain portion of the masters thought that a similar delegation from both bodies might be charged with the function of regulating wages; that the masters meeting in general assembly, and the weavers meeting in general assembly, a given number of men should be chosen by each, possessing mutual confidence, and that they might discuss the establishment of a tariff of wages, which should be peremptory; they did so meet, and the authorities consented that, if they could determine a rate of wages to be paid after a due examination of the position of the masters and the men, the authorities, I say, having heard of the discussions which took place, did determine that they would give to the decisions of those bodies the force of law; and a decree was published, which established the rate or *mercuriale* of wages, as it was called. There were returns received from all quarters as to the existing contracts between masters and men; an average tariff was fixed on, which was recognised by the authorities, by the prefect on the part of government, and by the municipality on the part of the town: the authorities claimed the power of interference to give effect to the tariff."—pp. 10, 11.

This tariff was in effect for only a few weeks in 1832. The disastrous events which occurred at Lyons in that year are considered by Dr. Bowring to have been entirely consequent on a measure which was put in operation with the hope of lessening the distress. After stating the consequences which resulted, and which are too well known to need repetition here, Dr. Bowring continues:—"I shall give no opinion at present as to the different circumstances which may exist here, but of course I cannot but have received a certain impression from the substantive and positive fact that the experiment of establishing a forced rate of wages was made on a great scale, and the distress consequent upon it was dreadful, particularly to the working classes, who were the principal sufferers; the whole organization of society was disturbed, and Lyons from that moment to this has never recovered its former position. Not but that it is desirable that some means should be found for bringing men and masters together amicably, to discuss many points where the discussion might be beneficial; and the time I hope is coming when Parliament will come to the serious consideration of those causes which displace labour, and for the distress resulting from which the legislature is bound, if it can, to find some alleviation or remedy."—p. 11. The operation of the tariff is thus described by Dr. Bowring:—"The high-minded and intelligent and wealthy masters felt themselves bound by the engagement they had undertaken: but others, desirous to enrich themselves, (and there were a great many such) made bargains with weavers at lower terms than the tariff; and it was very soon found that though for a certain time the majority were submissive to the tariff, yet its regulations were soon broken, there being a much stronger interest in violating the tariff than there was in preserving it; an interest created on one side by the distress of the weavers, who could not all obtain work upon the terms of the tariff, and were willing to work for lower wages; and that of the masters on the other hand, who naturally wished to pay as low wages as possible. Thus those among them who were obedient to the laws were made the victims of those who were not obedient. A certain number of the principal manufacturers kept faith; they were earnestly desirous of making the experiment; some I saw said they would give anything to keep up the rate of wages, but they were interfered with by interlopers, so that the tariff placed the honourable in a worse position than the dishonourable. The course of things was precisely this: a distressed weaver would go to a master and say, 'Sir, I want work,' and is answered, 'I cannot pay you according to the terms of the tariff; it gives me no profit.' The weaver says, 'But I must have work at all events; I will not starve. The tariff gives ten, I will take it at nine; nine is better than nothing; I will tell nobody.' The article is produced; the man who has paid ten finds himself in the market meeting one who has paid nine; how can he compete with him? he is forced to lower his own rate of wages; a general fall becomes inevitable while there is a supply of labour beyond the demand."—p. 12.

The following extract does not perhaps apply directly to the particular subject under consideration, but it is inserted, as it has an indirect and by no means a remote influence upon the general condition of weavers. "Taste is a costly article in this country; there (in France) it is a cheap one, and the causes are easily explainable; every thing that represents taste is accessible to every body. The holidays even of the people are spent among sights and visiting beautiful objects; whereas here in England we have no museums open to them, and there is rather a disposition to destroy than to admire works of art: in France it is quite the contrary. The result is, the whole tendency of the manufacturing industry of France is towards the regions of taste, and in that part of the field we cannot compete with it."—p. 24.

"Before the Revolution there was a body called Maitre-gardes, which interfered arbitarily under the directions of various guilds or companies, whose powers of legislation were very great, and which assumed a direction over labour in a thousand ways. They decided on the length and breadth and manner of weaving and dyeing; they had a right of entry into the houses of weavers without notice, and they in fact represented all the ancient despotism of the guilds which at a more remote period existed here and elsewhere. Of course this institution was completely broken up by those decrees which grew out of the French Revolution, and which proclaimed what was called 'the liberty of industry. They destroyed all the laws with respect to apprenticeship, and recognised equality as a general right. This state of things still exists, so that any man may work at any trade in which he can find any body to employ him; the sole condition of the general law being that he is to bear with him a small book called a "Livret," which contains the history of his engagements, the names of his masters, his general conduct and character, and which book he is required to present to any master into whose service he desires to enter; it is, in fact, a sort of introductory passport. . . . . Is a livret a book on which he is sworn? —No, a mere record of his manufacturing bargains. The master states there the fact that he was employed for so many years or months or days, and the master is bound by law to do it. . . . . Is that regulation established by force of law, or is it a voluntary regulation?—By force of law; I now speak of nothing but that which is recognised by law. It was imagined by Buonaparte that if he could create an institution by which the quarrels between master and man could in some way or other be regulated, and masters and men be brought together, he should get rid of many disagreeable questions, and it would take a great number of cases out of the ordinary tribunals; such a tribunal being charged with many functions of a local nature. In 1806 the first decree appeared; at all events I believe that is the first decree which established what was called a *Conseil des Prud hommes* This decree regarded the town of Lyons alone. In 1809 a general decree came out, of which I will give the principal heads:—it determines that a council shall be established, composed of master manufacturers and operatives of the different branches of manufacturing labour, the master manufacturers to have, in all cases, a majority of one. That any town which through its chamber of commerce shall apply for the establishment of such a council, and has the sanction of the prefect for doing so, shall obtain the right to establish such an institution; and that a third of the members of the Conseil des Prud'hommes shall be renewed every year.'—p. 13.

Whether any advantage might be likely to be derived from the establishment in this country of courts similar to these Conseils des Prud hommes, may be worth consideration. By bringing the masters and men together, and affording them the opportunity of mutual explanation, they might perhaps have some effect in preventing disputes, or bringing those that arose between the two parties to a more speedy adjustment. At all events it is perfectly evident that the remedies principally relied upon by the authors of the report are perfectly delusive. The only efficient remedy proposed by any of the witnesses is, that hand-loom weavers should turn to other branches of industry. "I have no suggestion to make," says one witness, (Mr. Gardiner, p. 145,) "my own opinion is, that bad as their situation is at present, it will be worse if they do not get other employment; and therefore what I would recommend is, if the legislature could do anything in providing for the children being apprenticed to other trades (mechanical trades,) I feel satisfied

and carried, *en caravan*, inland from Trebizond to Erzeroum, Tabriz, &c. For more than two centuries these traders were in the habit of purchasing at Constantinople large quantities of European manufactured goods for the Persian market, and these goods were chiefly, but not entirely, introduced into the Schah's dominions in the manner just described.

In the winter season, deterred by the terrors of the Black Sea, which are frequently formidable even to skilful navigators with good ships, the merchants, on leaving Constantinople, crossed the Bosphorus to Scutari, which may be called an Asiatic suburb of the capital, and thence transported their goods by land through the interior of Asia Minor, by Bolo and Erzeroum, which last-named city was in all cases a key and pivot of their operations. The average length of the over-land journey from Constantinople to Tabriz, or Tauris, was from eighty to ninety days, and the expense, which fell upon the goods, was from fifteen to eighteen per cent. The partly sea-route by the Black Sea and Trebizond was shorter and cheaper. Notwithstanding the very inferior quality of the vessels generally employed, on an average goods were not longer than sixty-five days from Constantinople to Tabriz. Of late years the carrying trade from Constantinople to Trebizond had been in the hands of the Genoese with the Sardinian flag, and of Ragusans under the Austrian flag. These vessels also took grain and salt to Trebizond, and brought back to Constantinople, among other articles, considerable quantities of boxwood, which is one of the valuable productions of the country. But the great gain of these Ragusans and Genoese was made in a contraband trade they carried on in copper; which valuable mineral has always been monopolized by the Sultan, who holds as his property all the mines which are farmed out to individuals on the spot. Smugglers of copper are threatened with the severest punishments, but between Turkish indolence on the one hand, and the cupidity and corruptibility of the officers of customs, on the other, the laws were easily evaded.

These shipmasters, and more particularly the Ragusans, seldom hesitated in engaging in the slave-trade; and in spite of all the laws, denunciations, and penalties existing in Europe, they not unfrequently took in whole or partial cargoes of white slaves at Trebizond, or other parts of the coast, for Constantinople. In addition to these *Christian* vessels, there was a certain number of saccolevas and other Turkish barks of the rudest and least safe construction, which made the voyage to and from the capital. With clumsy, antiquated stern quarters high out of the water, like Chinese junks, with their masts raking forwards and not aft like ours, with their anchors thrown out at their midships as in the time of the shipwreck of St. Paul, with their oddly-shaped sails and yards, which are cumbrous and difficult to move, and admit of no reefing, and with the signs of age and the rot, which are generally pretty visible in their timbers, nothing can well be conceived more antiquated and picturesquely grotesque than these Turkish trading vessels. The rais, or captain, being totally ignorant of the simplest scientific part of his profession, has never any maps on board, and very seldom so much as a compass. He trusts in Allah, and Mahomet his prophet, and in his own knowledge of the capes and headlands he has to pass; and so he creeps along the coast, performing in so many weeks what an English vessel would do in as many days. Notwithstanding that they generally, if not always, choose the fine season, several of these vessels, with cargoes and crews, are lost every year.

It had long struck some intelligent merchants engaged in the Levant trade that advantage might be taken of all these circumstances, and that Trebizond would be a proper place for establishing a depôt, to which British goods might be carried direct at much less expense. In consequence of some representations of this sort our government, about five years ago, sent out a consul to Trebizond. For some time this gentleman appears to have had little or nothing to do except to collect information. Wedded to their old customs the Persians and Turkish traders made their usual caravan journeys, or embarked at Trebizond once in the year, still continuing to look to Constantinople as the only proper mart, and giving small encouragement to the formation of a market nearer home. On the other side, the European traders at Constantinople and the other scales of the Levant did not very readily enter into the new scheme, and as full freights were not to be procured, our shipping left the carrying trade to Trebizond in the old hands. We believe it was chiefly through Said-khan, an Armenian-Christian born in Persia, who has been several times to England as commercial agent for the late hereditary prince, Abbas Mirza, that the spell was first broken. In conjunction with an opulent and enterprising London house, a ship with a mixed cargo was sent out from the Thames to Trebizond direct, in the summer of 1831. If we have been correctly informed, the speculation, being mixed up with a return cargo chiefly of copper, which (in itself a new and untried trade) was to be brought *from Persia* over-land to Trebizond, turned out far from successful. But in commerce, as in everything else, first experiments are generally failures, and their very errors and miscalculations lead to after correctness and success. It was a great point to show our flag in that quarter, and to prove to the people of the country that a direct trade was very practicable.

By degrees the natives became inclined to relinquish their old routine, and to buy at Trebizond instead of going to Constantinople. Several ventures were sent up the Black Sea from the Turkish capital and Smyrna in British bottoms. Vessels were dispatched from England with cargoes to be delivered in part at the ports last-mentioned, and in part at Trebizond, and we now hear that a large English sloop is to be kept in constant course between these three places.

We are aware that it will require time, and that several difficulties are to be overcome ere this new trade can become extensive and flourishing; but with regard to one of the greatest of these difficulties, *i.e.*, the turbulent character of the people, we know nothing likely to correct and humanize it half so soon as a gradually extending commercial intercourse.

The market is a tolerably large one, even without looking far into the interior, or across the frontier into Persia. Trebizond has a population of about 50,000; Baïbout, at the distance of two days' journey, of 5000; Erzeroum, at about four days' journey, of 70,000 or 80,000; Cara-Hissar, with the adjoining villages, of 15,000; Sivas, at six days' distance, is nearly as large as Trebizond; and Tocate, at six or seven days', is nearly as well peopled as Erzeroum; Amassia, a great depôt of raw silks, and only one day's journey from Tocate, has from 40,000 to 50,000 inhabitants; and, not to mention others, Ipsera, Tekjeh, Vijan, and Terdjan are all considerable towns. A pretty constant communication between the port of Trebizond and all these towns is kept up by means of caravans. Again, the line of coast on either side of Trebizond, for the distance of upwards of 100 miles, though there are few large towns, abounds in villages and detached residences, which, united, contain a very considerable population. As he came down the Black Sea in a Turkish boat from the port of Redout-Kale in Mingrelia, at the foot of Mount Caucasus, and passed the province of Gourieh (a part of the antient Colchis, so famous for the expedition of the Argonauts, and for being in antient times the centre of a great trade between Europe and Asia), M. Fontanier was forcibly struck with the richness of the land. "No country in the world," he says, "would be more fertile than these shores of the Black Sea, were they not the theatre of such barbarism and anarchy." On getting nearer to Trebizond he was equally struck with the exceeding beauty of the scenery, and the number of scattered and picturesquely-situated houses, placed for the most part in the midst of gardens or orange-groves. The olive tree grows there in perfection, and oil might be soon classed among the exports of the country. At Betoum, at Vitzeh, at Rizeh (a town which, with an adjoining village, counts 3000 inhabitants), at Mahané, and other points, there are little harbours which suffice for the country boats that carry on the cabotage, or coasting trade, and that frequently go to Trebizond to exchange produce for manufactured and other goods. Coffee is an article in constant demand; and we are assured that a valuable little trade will be created in cheap cutlery, woollen cloths, cotton-yarn, low printed muslins, calicoes, &c.

In nearly every part of the country the Turkish population is mixed in the proportion of about one to three, with Asiatic Greeks, who are tolerably industrious and intelligent in cultivating the soil, and with Armenians, who, all over Asia, and indeed wherever they are scattered, have a remarkable predilection and talent for trade. Many of these Armenians, for the sake of such a modicum of profit as would make the keeper of a chandler's shop in England

smile incredulously, will undertake inland journeys of an extraordinary extent, braving the terrors of the desert, the plague, the Pashas, the Courds and other robbers, and plodding on their way in fair weather and foul, being stopped neither by the ice and snows of the Caucasus and Mount Taurus, nor by the heat and drought of the vast plains of Asia Minor, Syria, or Arabia. The Turks call them men-camels, and they merit the name by their patient endurance of fatigue and privation, their perseverance, and habitual abstinence. In whatever place a few of these traders is to be found, *there is* a nucleus and a medium of an expanding commerce; and although in the large cities, as Constantinople and Smyrna, the high reputation of the Armenians for probity and good faith in all their transactions, has been somewhat tarnished of late years, we have reason to believe that the provincial dealers are in general remarkably honest and trust-worthy.

The most important export from Trebizond, and one that might be rendered, by a change in the monopolizing or farming system of government, the most readily available, is probably the copper; though it is by no means unlikely that the mines of Gumush-Khane, which are not above thirty miles from the port, and which formerly rendered not only lead but considerable quantities of silver, might be worked to advantage. The nearest copper mines now in activity are at Maaden, about twelve miles from the town of Baïbout, and between fifty and sixty from the port of Trebizond. In 1826 M. Fontanier, accompanied by an Armenian trader, visited the spot, where he found a Greek village containing 500 families, all the working members of which were employed in the mines. "The Grand Signior," he says, "exempted them from all kinds of taxes, and make them work by *corvées*; the workmen received, besides, an indemnity which rose from half a piastre to two piastres (from 2*d.* to 8*d.*) per day, and they were allowed to cultivate for their own use the fields in the neighbourhood, which appeared to be in a tolerably good state of culture. The director *had purchased his employment at Constantinople*, and his speculation included the silver mines of Gumush-Khane; he engaged to deliver to government a given quantity of copper at the fixed price of thirty piastres *per batman* (about twelve francs for twenty lbs. French); the mining expenses were at his charge. Before bringing the copper to its state of purity he was obliged to submit it ten times to a charcoal fire, which was made of pine or fir-wood brought from the distance of about twelve miles. In mining, the workmen made use of the crow-bar and pick-axe, without employing gunpowder. This second method, however, would be more advantageous, to judge from the geological nature of the spot; its formation, indeed, is nothing but a succession of reddish, calcareous layers distinctly stratified, traversed by veins composed of calx, or lime, and of mica, which contains the metal."

We have no doubt whatever that European science would soon introduce a hundred different improvements in the methods of working these mines, in which, mixed up with the copper, Tournefort was informed that that beautiful and valuable substance called *Lapis Lazuli* was occasionally found. It appears, however, that the mines of Cuné in the interior, which are said to be the richest copper mines in the world, are tolerably well worked, and are placed under a more liberal administration than the other mines, having long been in the hands of Armenians, who allow private speculators to extract and smelt the ore. Besides being exported from different points to Persia, and, indirectly, to India and China, considerable quantities of this Cuné copper find their way, by caravans, to Trebizond. But the surest way to render this article an advantageous export from Trebizond would be to work the mines in the neighbourhood, and so save the expenses of a long carriage by land; and we have been informed that rich veins of copper, though now neglected, on account of the unwise system of the Sultan's government, exist much nearer to Trebizond, or at least nearer to the coast (whence the carriage by water would cost exceedingly little) than the mines at Maaden, where the copper is for the most part dug and smelted.

One of the greatest hardships of which the people had to complain was their being forced to transport the copper from the interior. In this labour their camels, horses, and mules were frequently sacrificed, and their owners were never paid for the loss. When a *corvée* of this sort was talked of whole districts were thrown into dismay, and the camel drivers ran in all directions to conceal themselves and their valuable animals. With a proper remuneration for their labour and risk, and on a voluntary bargain they are, however, always ready to convey copper to the coast.

At greater or less distances the interior furnishes, besides silk, plenty of goats' hair, some cotton, red cotton thread, beautifully dyed, fine, soft Morocco leather, some furs of tolerably good quality, anise, gum ammoniac, galls, and other drugs and substances in demand in our markets. If we look to the north-western provinces of Persia, to which, as we have already said, Trebizond is the most direct, as it is the most frequented port, the amount of these commodities proper for exportation will be considerably increased.

Ever since 1821 the Russians have been trying, but in vain, to change this old trading route, to induce the Persian merchants to go through their possessions in Georgia to the Czar's port on the Black Sea, and to make the now essentially Russian city of Tiflis, the point of operations and the centre of the commerce between Persia and Constantinople, instead of the Turkish city of Erzeroum, which now enjoys that advantage. Nothing, we believe, short of such farther conquest or usurpation of territory as shall give Russia the entire command of the old route, will ever induce either Persians or Turks to change it. During last year a caravan from Trebizond, which was chiefly conveying English goods into the interior, was attacked and pillaged by the Courds, who, as it was rather openly hinted, had been incited to that act by Russian agents expressly employed to bring that route into discredit, and to check the importation of British manufactures.

We will not positively deny that such might have been the case, but we think it ought to be remembered that the Courds, like the Arabs of the desert, are a people of predatory habits, who have been accustomed for many ages to plunder caravans without any other suggestion than that of their own cupidity. We should observe, however, that M. Fontanier says that the fear of these robbers was not near so great as people generally supposed in Europe. "I have questioned," he says, "a great many merchants, who have assured me that they had not been pillaged by the Courds for twenty years, and that even when that misfortune happened they in most cases got back their goods by means of a small sacrifice." These remarks were made in 1826, but in 1828 we know, of our own knowledge, that the caravan of Abbas Mirza's agent, Saïd Khan, which also carried British goods,* was plundered by the Courds on its way from Trebizond to Persia. Is it that these semi-barbarians have a peculiar taste and preference for British merchandise? Is it that in these two cases proper steps were not taken to ensure a safe transit across the country occupied by the tents, cattle, and flocks of the Courds? We really are averse to admit the other supposition, although from all that we have read, heard, and seen, we have no very exalted notion of the honour or scrupulousness of that host of nondescript *employés* which Russia throws out on all her frontiers. Be this as it may, we are inclined to hope—to trust, that the Nomadic tribes, who hate and dread the Russians, will be easily detached from them, (supposing that any relations exist between them) and that by slight payments, which may be set down as a transit duty, the Courds will allow the caravans to pass unmolested. Like the Arabs they are faithful to their bargain, and their word, when once pledged, is to be depended upon.

A considerable colony of Persian merchants exists at Erzeroum, and the late Prince Abbas Mirza had a *chargé d' Affaires*, with a regular establishment in that important city, to protect the interests of the colony, and to superintend the trade with Trebizond, Tocate, Constantinople, and other markets. In 1828 there were four caravanserais occupied by Persians, attending almost exclusively to the trade with Europe. These speculators dealt largely in shawls and in cherry-sticks, which last are drilled and converted into pipe-tubes, and form a very important article of trade at Constantinople.

By treaty the Persians were to pay on the Turkish frontier a transit duty of five per cent., but in spite of their address, and the vigilance and exertions of their resident at Erzeroum, they were generally obliged to pay another *irregular* duty, or a series of impositions varying from five to ten per cent. in the interior. Not a farthing of these after payments, probably, ever reached the coffers of the sultan;

* These goods were conveyed from Constantinople in a Genoese brig.

they were enjoyed by the pashas and local governors, who levied them as best they could, and made them as heavy as possible. We apprehend that the death of Abbas Mirza was a severe blow, and that since the death of his father, the late king, owing to the confusion Persian affairs have fallen into, this interesting line of commerce has been neglected, and has suffered considerably.

It has not been our intention in these notes to awaken any *immediate* brilliant expectations; Trebizond is only an opening; from many adverse circumstances its trade must be a limited one, and we can scarcely hope for a speedy removal of the causes which check and embarrass it. These causes arise out of the wretched condition and misgovernment both of Persia and Turkey. The first of these two countries seems to be in a state of disorganization; the right of succession is not yet settled, the young king sits unsteadily on his throne, and Tehran and Tabriz swarm with Russian agents, whose objects and views are, *at least*, doubtful. If the British embassy under the Honourable E. Ellis, which has just left these shores, prove efficacious in maintaining the peace with Russia, and in restoring general tranquillity to Persia, then indeed, on that side, trade might make rapid growth and increase, for there is a fine elasticity and rebound in the Persian character, and according to Sir John Malcolm and other observers the steps they have sometimes made towards prosperity in a very few years are altogether extraordinary.* But all this is hypothetical; and then there remain the evils of the intermediate country, of Turkey, which lies between our ships and any counting-houses we may establish at Trebizond and the Persian frontier.

In the course of these Notes in our last Number we ventured to dissent from some of Mr. Urquhart's opinions concerning the facilities afforded to commerce, and the exceeding moderation of duties on foreign goods in Turkey. That gentleman's notions on free-trade—on an entire freedom of trade—are so much in accordance with our own, and with those of others whose opinions we value more than we do our own, and his views are generally so liberal and philanthropic, that it is almost with pain that we say that we differ from him *toto cœlo;* not so much indeed with regard to the natural resources of the Turkish dominions as with regard to the system of administration which he almost invariably extols, and the faculty and inclination of the Porte to make the best of these resources, in which, though he now and then contradicts himself, he seems firmly to believe.

The fact is, Mr. Urquhart has been somewhat deluded by the generalizations, and paid ex-parte pleadings of the Sultan's newspaper, "Le Moniteur Ottoman;" he has given too ready a belief to the statements of Turks and Armenians employed in different branches of the administration; he has looked upon their systems on paper and not in practice; and he has taken the pictures of Muradjea d'Ohsson, which represent what the Turkish religion, government, and people *ought to be*, for faithful representations of what they actually *are*. It were just as wise to judge of our bench of bishops by the accounts of the apostles and primitive fathers of the church, or of the tradesmen of the Minories and Tower Hill after the scriptural portraitures of the shepherd warriors under Moses, Joshua, and David. Were the Ottoman code, as set down by the learned Armenian, acted up to, there is no doubt that with some capital errors and anti-social tendencies, it would contribute to make a happy and a prosperous people, but nearly every clause of that code has been nullified for ages, as it still continues to be by the ignorance, caprice, and insatiable greediness of despotism through all its grades, from sultans and pashas down to the agas of villages. With regard to commerce, indeed, even D'Ohsson could not conceal that the practice of government did not agree with its theory, and he *moderately* indicated the causes that checked the prosperity of the empire in the following words:—

"The trade of the states of the Grand Signior is, without doubt, considerable; but it would be much more so if the Mahometans were better instructed, and if the government *protected agriculture*, encouraged the arts, and paid attention to the proper means of making their subjects enjoy the resources that *might be* procured from vast provinces, a rich and fertile soil, abundant and varied productions, and an infinitude of seaports adapted to become the *entrepôts* of the trade of the East and the West." But Mr. Urquhart himself says:—

"The immunities which commerce and merchants enjoy are unfortunately not extended to other avocations; *the cultivator of the soil is ever a helpless prey to injustice and oppression.* The government agents have to suffer in their turn from the cruelty and rapacity of which they themselves have been guilty, and the manufacturer has to bear his full share of the common insecurity; he is fixed to the spot, and cannot escape the grasp of the local governor. The raw material monopolized by a bey or ayan, may be forced upon him at a higher price than he could purchase it himself, and perhaps of inferior quality, and fines may be imposed on him; he may be taken for forced labour, or troops may be quartered on his workshop."*

Now we look upon this as conclusive. In a country whose chief and capital resource is, after all, agriculture, when the agriculturist "*is ever a helpless prey to injustice and oppression,*" (and that he positively is so we could establish by a hundred facts gleaned during our own travels in Turkey, or from the testimony of others who have visited that country), there can be none of that security and internal prosperity which alone give aliment and increase to trade. It is of no use granting immunities to the seller of foreign goods if the buyers, by whom he is to live, are impoverished and crushed by taxation and impositions of all kinds. The merchant is only a purveyor, who increases or decreases his supplies according to the faculty of his customers; their interest is his interest; he only prospers by their prosperity, and whatever impoverishes them embarrasses and narrows the scale of those operations by which he gains his bread. To put an extreme case: let a government place a dealer in foreign goods in a large town—let it exempt him from all taxation and from every duty or excise on the goods he imports, and it will all be useless to him if the inhabitants of that town and district, with whom alone he is to deal, are sunk to one level of pauperism by taxes and arbitrary exactions. But the commercial immunities Mr. Urquhart speaks of do not exist; the duties are much heavier than he assumes them to be, and merchants, like all other classes of the sultan's subjects, are constantly exposed to avaniahs, rapacity, and tyranny.

Mr. Urquhart is eloquent in praise of the municipal institutions of the empire and of the privilege the Turks have left even their rayah subjects in the villages, burgs, and sections of the country, to make their own assessments;—but where is the benefit of this privilege when there is no protection for either in-door or out-of door property—when the corn-fields, the vineyards, the olive-groves are constantly exposed to the grasp of the strong hand—when the bastinado is in attendance at the outside of the door for those who have not voted enough money, or made the taxes such as the Pasha or Moutzellim requires?

We shall never forget the breaking up of one of these municipal meetings, or, as Mr. Urquhart calls them, "Amphictyonic councils," which we witnessed at a village in Asia Minor! Two Greek primates lay sprawling on the ground with maimed and bleeding feet, and a posse of Turks were seizing and carrying off every article they could lay their hands on, not even excepting the implements of agriculture. In the face of such an alternative we question whether Mr. Hume himself would not vote a tax as *per order!*

One of the primary causes of the ruin of the Turkish empire arose out of the government practice of selling the Pashaliks to those who would pay down and promise the most money. Within the last few years there has been much talk about the Sultan's having reformed this crying abuse; but having taken some pains to ascertain the fact, we can confidently say that there has been scarcely any reform at all. The Pashas in the provinces are not changed quite so frequently: their appointments are formally announced in the Sultan's newspaper; but Mahmoud, constantly pressed by want of money, *sells the Pashaliks to the highest bidders just the same as ever.*

We fear that the formidable insurrection now raging in Albania, and the discontents in Bosnia, will not contribute to supersede this pernicious practice. For the present we cannot go farther into the subject, and must conclude with a very few more words on Trebizond.

* "The city of Ispahan has more than doubled its inhabitants, and quadrupled its manufactures of rich silk and brocade, during the twenty years that Haji Ibrahim has been governor."—*Malcolm's Sketches of Persia.*

* "Turkey and its Resources," &c. 1 vol. 8vo. Lond. 1833.

The port affords pretty good anchorage, but as it is not protected against the north winds, which blow with great violence in the Black Sea during the winter, vessels are obliged in that season to take refuge at Platana, about three miles to the west of Trebizond. The town, except during the occasional visits of the plague, is very healthy; the bazaars are tolerably well supplied with provisions; the neighbouring country is, as we have said, beautiful and picturesque, abounding with houses and villas. Old Tournefort was so struck with the beauty and pleasantness of a spot on the hills, in the midst of woods and meadows, falling waters, and limpid streams swarming with the finest trout, that he says he could have wished to pass the rest of his life there.

Under the influences of civilization what might not this country become? With carriageable roads cut to Erzeroum, Tocat, Diabekir, the mines of Cuné, and the shores of the Tigris and Euphrates, with other roads leading round the shoulder of Mount Ararat to the Araxes, and across Persia, Trebizond might be one of the first marts in the world; but, for the present, this is only a brilliant day-dream.

BILL FOR PREVENTING THE PUBLICATION OF LECTURES WITHOUT CONSENT.

THE preamble of this bill states that "Printers, publishers, and other persons, have frequently taken the liberty of printing and publishing lectures delivered upon divers subjects, without the consent of the authors of such lectures, or the persons delivering the same in public, to the great detriment of such authors and lecturers."

The first clause gives to authors of lectures, or their assigns, the sole right of publication; and all persons publishing and exposing for sale any lecture, or portions of any lecture, without the consent of the proprietors, are liable to forfeiture of all copies in their possession, either printed, lithographed, or otherwise copied, together with a penalty of one penny for every sheet of such copies.

2. Printers or publishers of newspapers reporting and publishing any lecture, without consent, are liable to the same forfeiture and penalty.

3. Persons having leave to attend lectures are not on that account to be allowed to publish them.

4. The act is not to extend to prohibit the republication of lectures which have been once printed, after the expiration of the copyright, given by the 8 Anne, c. 19, entituled "An Act for the encouragement of learning, by vesting the copies of printed books in the authors or purchasers of such copies during the times therein mentioned;" and the 54 Geo. III., c. 156, entituled "An Act to amend the several acts for the encouragement of learning, by securing the copies and copyright of printed books to the authors of such books or their assigns."

5. The act is not to protect any lecture or lectures, of the delivery of which notice in writing has not been given to two justices living within five miles of the place where the delivery is to take place, two days at the least previous.

LIST OF BILLS BROUGHT IN.

HOUSE OF LORDS.

June 11. Prohibiting subscription to Thirty-nine Articles in certain cases.—*Lord Radnor.* (Thrown out July 14.)

— 22. For effecting greater uniformity of practice in the government of the several prisons in England and Wales.—*Lord Melbourne.*

July 2. For protecting the revenues of vacant ecclesiastical benefices without the cure of souls, and for preventing the lapse thereof during the pending inquiries respecting the state of the Established Church in England and Wales.—*Archbishop of Canterbury.*

— For enabling the Court of King's Bench to take recognizances to any amount from defendants who remove indictments and presentments into that court by writ of *certiorari*, and for preventing prosecutors from obtaining such writ without leave of the court.—*Lord Denman.* (Withdrawn July 13.)

3. For promoting education and regulating charities.—*Lord Brougham.*

13. For preventing vexatious removals of indictments into Court of King's Bench, and for extending the provisions of an act 5 William and Mary, for preventing delays at quarter sessions to obtain indictments.—*Lord Brougham.*

Aug. 5. To amend two clerical errors in act 9 Geo. IV., for consolidating and amending the laws in Ireland relating to larceny, &c.—*Lord Farnham.*

10. For preventing the publication of lectures without consent.—*Lord Brougham.*

14. To amend an act of the present session, entitled "An Act for the more effectual abolition of Oaths and Affirmations taken and made in various departments of the State, and to substitute Declarations in lieu thereof," and for the more entire suppression of voluntary and extra-judicial oaths and affidavits.—*Duke of Richmond.*

LIST OF COMMITTEES.

HOUSE OF LORDS.

June 24. Select Committee to consider and report on the subject of the Prisons Regulation Bill.

29. To inquire into the expediency of substituting a Declaration in lieu of Oaths in certain cases.

30. To consider plans for more convenient temporary accommodation of their Lordships.

July 15. Select Committee on Prisoners' Defence Bill.

Aug. 17. Select Committee on Bill for Reduction of Militia Staff.

LIST OF BILLS BROUGHT IN

HOUSE OF COMMONS.

July 24. Sheriffs' Declaration Bill—"for removing doubts as to the declaration to be made, and oaths to be taken, by persons appointed to the office of sheriff of any city or town, being a county of itself."—*Attorney-General.*

— Excise Incorporation (Scotland) Bill—"for abolishing the excise incorporation in Scotland, and for transferring the funds of the said incorporation to the consolidated fund, and providing for the payment of the annuities to the widows and orphans of the late and present members of the incorporation fund.—*Mr. Baring.*

— 27. Sale of Beer Acts Amendment Bill—"to amend two acts of the first, and fourth and fifth years of his present Majesty, to permit the general sale of beer and cider by retail in England."

— Turnpike Trusts Consolidation Bill—"to authorize the consolidation of the trusts of turnpike roads in that part of Great Britain called England."—*Mr. Fox Maule.*

— Turnpike Acts Continuance Bill—"for continuing, for a limited time, the several acts for regulating the turnpike roads in Great Britain, which will expire with the next session of Parliament."—*Mr. Fox Maule.*

— 30. Public Roads (Ireland) Bill—"to give effect and validity to certain contracts and presentments for repairing and keeping in repair certain public roads in Ireland, and to the sureties entered into for the execution thereof."—*Mr. More O'Ferrall.*

31. Municipal Corporations (Ireland) Bill—"to provide for the regulation of municipal corporations and borough towns in Ireland."—*Attorney-General for Ireland.*

— Tonnage Admeasurement Bill—"to regulate the admeasurement of the tonnage and burthen of the merchant shipping in the United Kingdom."—*Mr. P. Thompson.*

— Steam-vessels (Thames) Bill—"to regulate the navigation of steam-vessels upon the river Thames."—*Mr. Alderman Wood.*

Aug. 3. Militia Staff Reduction Bill—"for the further reduction of the militia staff, and to suspend the ballot for the militia."—*Lord John Russell.*

— Fines and Recoveries Office Bill—"to abolish certain offices connected with fines and recoveries, and the cursitors in the court of Chancery, and to make provision for the abolition of certain offices in the superior courts of common law in England."—*Mr. Baring.*

4. Peace Preservation (Ireland) Bill—"for the better preservation and more speedy punishment of offences endangering the public peace in Ireland."—*Lord Morpeth.*

— Tea Duties Bill—"to impose certain duties on tea."

7. Sheriffs' (Ireland) Bill—"for facilitating the appointment of sheriffs in Ireland, and the more effectual audit and passing of their accounts, and for the more speedy return and recovery of fines, issues, forfeited recognizances, penalties, and deodands; and to abolish certain offices in the court of Exchequer in Ireland, and to amend the laws relating to grants *in custodiam* and recovery of debts in Ireland, and to amend an act passed in the second and third years of his Majesty's reign, intitutled "An Act for transferring the powers and duties of the commissioners of public accounts in Ireland to the commissioners for auditing the public accounts of Great Britain."—*Mr. Serjeant O'Loghlin.*

10. Constabulary Force (Ireland) Bill—"to amend an act of the third year of the reign of his late majesty king George the fourth, for the appointment of constables in Ireland."—*Lord Morpeth.*

— Paymaster-General Bill—"for consolidating the offices of paymaster-general, paymaster, and treasurer of the navy, and treasurer of the ordnance."—*Chancellor of the Exchequer.*

— Slave Compensation Bill—"to carry into further execution the provisions of an act passed in the third and fourth year of his present Majesty, for compensating owners of slaves upon the abolition of slavery."

— Charities Commissioners Bill—"for appointing commissioners to continue the inquiries concerning charities in England and Wales."

— Tithes on Turnips Bill—"for the amendment of the law as to the tithing of turnips in certain cases."—*Captain Pechell.*

— Tithes Recovery Bill—"for the more easy recovery of tithes."—*Captain Pechell.*

11. Hereditary Revenue (Scotland) Bill—"to amend the acts relating to the hereditary land revenues of the crown in Scotland."—*Mr. R. Steuart.*

— Registration of Voters (Ireland) Bill—"to amend the law relative to the registry of voters in Ireland, and to taking the poll at elections in that part of the United Kingdom, and to assimilate the same as nearly as may be to the law in force in England and Wales."—*Serjeant O'Loghlin.*

12. Insolvent Courts (Ireland) Bill—"to authorise the granting of superannuation allowances to the commissioners and officers of the courts for the relief of insolvent debtors in Ireland."—*Serjeant O'Loghlin.*

— Poor-Law Amendment Bill—"to amend an act for the amendment of the laws relating to the poor in England and Wales, so far as the same respects the expenses to be incurred in the building or purchasing of workhouses."—*Mr. Law Hodges.*

13. Forgery (Scotland) Bill—"to provide that persons accused of forgery in Scotland shall not be entitled to bail unless in certain cases."

— Court of Exchequer (Scotland) Bill—"to amend an act of the second year of his present Majesty, for making provision for the dispatch of the business now done by the Court of Exchequer."—*Lord Advocate.*

— Factories Bill—"to repeal an act passed in the third and fourth years of his present Majesty King William the Fourth, for regulating the labour of children and young persons in the mills and factories of the United Kingdom, and to substitute other provisions in lieu thereof."—*Mr. Hindley.*

14. Special Constables Bill—"for enlarging the powers of magistrates in the appointment of special constables."—*Mr. Fox Maule.*

— Parochial Workhouses Bill—"to facilitate the conveyance of workhouses, and other property of parishes, and of incorporations or unions of parishes in England and Wales"—*Mr. Fox Maule.*

15. Spirit Licenses and Wine Permits Bill—"to exempt certain retailers of spirits to a small amount from the additional duties on licenses, and to discontinue the excise survey on wine, and and the use of permits for the removal thereof."

— Clerk of the Crown Bill—"to repeal so much of an act passed in the 3rd and 4th years of his present Majesty, as relates to the amount of the salary granted to the Clerk of the Crown in Chancery, and to make other provisions in relation to the said office."

— St. Margaret's Rectory Bill—"for making one of the prebends of the Collegiate Church of St. Peter, Westminster, subservient to the spiritual wants of the parish of St. Margaret, Westminster."—*Lord John Russell.*

— Consolidated Fund Bill—"to apply a sum of money out of the Consolidated Fund, and the surplus of the Ways and Means, to the service of the year one thousand eight hundred and thirty-five."

— Exchequer Bills Bill—"for raising a sum by Exchequer bills for the service of the year one thousand eight hundred and thirty-five."

— Glass Duties Bill—"to repeal the duty and drawback on flint glass, to impose other duties and another drawback in lieu thereof, and to reduce the drawback on German sheet glass exported in panes, and to repeal the drawback on unground and unpolished plate glass, and to amend the laws relating to the duties on glass."

— Dublin Police Bill—"for improving the police in the district of Dublin metropolis."—*Lord Morpeth.*

— Legacy Duties Bill—"to exempt legacies to charitable institutions from duties of stamps."—*Mr. Raphael.*

19. Customs Duties Bill—"to amend the law relating to the customs."

— Dominica Relief Bill—"for granting relief to the Island of Dominica, and to amend an act of the second and third years of his present Majesty, for enabling his Majesty to direct the issue of Exchequer bills to a limited amount for the purposes therein mentioned."

21. Slave Treaty (Denmark) Bill—"for carrying into effect the treaty with the King of the French and the King of Denmark, for suppressing the slave-trade."—*Lord Palmerston.*

— Slave-Treaty (Sardinia) Bill—"for carrying into effect a treaty with the King of the French and the King of Sardinia, for suppressing the slave-trade."—*Lord Palmerston.*

LIST OF COMMITTEES.

House of Commons.

July 29. Committee "to consider of the best mode of ventilating and warming the new Houses of Parliament, and of rendering the same favourable to the transmission of sound."

— Committee to inquire into the conduct of General Darling while governor of New South Wales.

August 11. Committee "to inquire into the origin, nature, extent, and tendency of the Orange institutions in Great Britain and the colonies, and to report the evidence, and their opinion thereon."

19. Committee to inquire into certain circumstances attending a contract entered into with the Admiralty in the year 1835.

NEW MEMBERS.

Thomas Kavanagh, Esq., and Henry Bruen, Esq., for the county of Carlow, in the room of N. A. Vigors, Esq., and A. Raphael, Esq., unseated by the decision of a select committee.

NEW WRITS ISSUED.

For Belfast, in the room of John M'Cance, Esq., deceased.

For Cashel, in the room of the Right Honourable Louis Perrin, a Judge of the Court of King's Bench in Ireland.

POLITICAL RETROSPECT FOR AUGUST, 1835.

GREAT BRITAIN.

On Tuesday the 21st of July the Municipal Corporations Reform Bill, having been brought up from the House of Commons by Lord John Russell and other members, was, on the motion of Lord Melbourne, read a first time in the House of Lords. The Sinecure Church Preferment Bill was afterwards, on the motion of the Archbishop of Canterbury, considered in Committee, and reported.

On the same evening in the Commons, Lord Morpeth moved the order of the day for the commitment of the Irish Church Bill; upon which Sir Robert Peel moved that the Committee should be instructed to divide the bill into two bills. He and his friends, the right honourable baronet intimated, were disposed to acquiesce at least in the principle of that part of the measure which was directed to the settlement of the tithe question, but could not consent to the other part, which provided for the appropriation of Church property to other than ecclesiastical purposes. The debate which arose upon this amendment was continued by adjournments over the following two nights. When the House at last divided on Thursday night, or rather about three o'clock on the morning of Friday, there appeared for the amendment 282, against it 319. The House then went into Committee on the bill.

During these evenings, and also on that of Friday the 24th, various bills were advanced a stage in both Houses. Among others, the Imprisonment for Debt Bill went, on Friday, through the Committee in the Commons.

On Monday the 27th the House of Commons went again into Committee on the Irish Church Bill, and proceeded in the consideration of it as far as to the 49th clause, without any material alterations being made in the measures. Some of the clauses, however, were postponed.

On Tuesday the 28th it was, after a long discussion, agreed upon by the Lords that counsel should be heard against the Municipal Corporations Bill before it should be committed. Accordingly, Sir Charles Wetherell, and afterwards Mr. Knight, addressed their Lordships upon the subject, at great length, on the following Thursday, Friday, and Saturday.

In the House of Commons on the 28th, Mr. John Maxwell brought forward his motion for leave to bring in a bill for the relief of the hand-loom weavers, by the establishment of a minimum rate of wages. After some debate, the motion was negatived by a majority of 129 to 41. Mr. Spring Rice afterwards obtained leave to bring in a bill for consolidating the offices of Paymaster of the Forces, Paymaster of the Navy, Paymaster of Chelsea Hospital, and Treasurer of the Ordnance.

On Wednesday the 29th, a motion that Mr. Clipperton, one of the persons confined in Newgate for his participation in the affair of the Ipswich election, should be brought to the bar, reprimanded, and discharged, was carried, after some discussion, by a majority of 129 to 41. He was accordingly discharged the following evening. Mr. Sparrow, another of the persons implicated in the same transactions, had been in like manner discharged on the preceding Thursday. In the latter part of this evening the House sat again in Committee on the Irish Church Bill, the remaining clauses of which, with the exception of those formerly postponed, were all considered and agreed to. The bill for regulating the polls at elections also went through Committee.

On Thursday the 30th, Lord Francis Egerton, the chairman of the Yarmouth Bribery Committee, having reported to the House that a witness of the name of Prentice, who had been called before the Committee, had refused to answer the questions put to him, on the ground that by so doing he should criminate himself, it was ordered that Prentice should attend at the bar the following day. It was then ordered, on the motion of Mr. Hume, that Mr. Keith, attorney of Norwich, who had been charged by the Ipswich Committee with aiding and abetting in procuring and continuing the absence of the witness Pilgrim, should be committed to custody for breach of privilege. The remainder of the evening was occupied with a debate of some length upon a motion by Mr. M. O'Connell for the appointment of a Select Committee to inquire into the conduct of General Darling while Governor of New South Wales. The motion, which was opposed by Ministers, was carried by a majority of 55 to 47.

On Friday the 31st, Mr. Prentice appeared at the bar, and having persisted, after admonition, in his refusal to answer the questions of the Committee, was ordered to be committed to the custody of the Sergeant-at-Arms. After this business was settled, the Attorney-General for Ireland brought forward and explained the ministerial measure for the better regulation of the municipal corporations of that country. The motion for leave to bring in the bill having been agreed to, it was immediately brought in and read a first time. Lord Morpeth then obtained leave to bring in a bill for the better prevention of offences against the peace in Ireland. His Lordship explained at some length the provisions of the proposed measure, which was intended as a substitute for the Coercion Act. It authorizes the Lord Lieutenant to issue special commissions to Sergeants-at-Law, who are to be empowered to hold courts for the trial of offenders in disturbed districts, and also to warn the inhabitants to keep at home at nights, to require them to make out lists of their families, and to adopt other similar precautionary measures, but not in any case to order domiciliary visits.

On Monday, the 3rd of August, Lord Melbourne in the Lords, moved the committal of the Corporation Reform Bill, when a long debate arose on an amendment proposed by Lord Carnarvon, that evidence should be received in support of the allegations of the petitioners who had prayed to be heard against the bill. When their lordships divided, at nearly four o'clock on Tuesday morning, there appeared

was ready to return home. This noble bearing—this show of courage, in which quality we believe none of the family are deficient, increased the admiration and enthusiasm of the Parisians, who seem to appreciate courage more than any other virtue, and for four-and-twenty hours the whole Orleans dynasty was probably more universally popular than ever it had been before.

In the evening a certain number of the members of the chambers, the mayor and deputy mayors of Paris and its environs, and other deputations waited upon the King, after which his Majesty issued the following proclamation:—

"Frenchmen!—The National Guard and the army are in mourning; French families are in a state of desolation; my heart has been rent by a frightful spectacle. An old warrior—an old friend—who had been spared by the fires of a hundred battles, has fallen at my side, from blows which assassins destined for me. In order to reach my person, they did not hesitate to sacrifice glory, honour, patriotism, peaceable citizens, women, and children; and Paris has seen the blood of the best Frenchmen shed on the same spot and on the same day on which, five years ago, it flowed for the maintenance of the laws of the country! Those whom we have now to regret have fallen in the same cause. Again, it is the constitutional monarchy, the freedom of the laws, the honour of the nation, the safety of families, the welfare of all, that are once more threatened by my enemies and yours; but the public grief, which answers to mine, is at once a homage offered to the noble victims, and a forcible testimony of the union between France and her King. My government knows its duties, and will fulfil them. However, let the fêtes, which were intended to celebrate the last of these days, give place to ceremonies more in conformity with the sentiments with which our minds are impressed—let all due honours be rendered to the memory of those whom the country has just lost, and let those veils of mourning which yesterday shrouded the tri-coloured flag again be put over this faithful emblem of all the sentiments of the country. Given at the palace of the Tuilleries, this 28th July, 1835.

(Signed) "Louis Philippe.

"By the King.

"The President of the Council, Minister for Foreign Affairs,

"V. Broglie."

When, on the following day, the civil authorities leisurely examined the results of the atrocious affair, it appeared that the carnage was even greater than was at first expected. According to the "Journal des Debats," thirty-four persons were killed or wounded by the discharge; of these sixteen died on the spot, or immediately after their removal from it; and all the wounds were of a dangerous nature. Out of eight victims who were carried to one hospital (Hôpital Saint Louis), four were obliged to undergo amputation. Several women and children, who had gone to the review as to a *fête*, were either killed or wounded. Near to the spot where the brave old Duke of Treviso (Marshal Mortier) fell dead, the Generals Colbert, Heymés, Pilet, and Blin were all dangerously wounded. Besides bullets and shot the murderer had charged the barrels of his infernal machine with rusty nails, oblong square pieces of iron, and other missiles, so that most of those who were struck at all, had not one but several wounds. General Heymé's coat was pierced in four different places, besides which a ball struck him in the face. The spectacle of the anguish and despair of the survivors was in some instances more horrible than all the rest. In one place a mother was shrieking over the lifeless body of a beautiful female child only eight years of age; in another a father was fixed in silent, motionless despair by the remains of his daughter, a handsome girl of seventeen; in another a wife lay wounded by the side of her dead husband.

A day of solemn religious ceremonies, including prayers for the dead, and thanksgiving for those who had escaped, was fixed for the 4th of August; and on the 31st of July, Louis Philippe addressed a letter to all the French bishops, calling upon them to have these services celebrated in every church of their respective dioceses. But, before this circular left Paris, the Cardinal Prince de Croi, Archbishop of Rouen, affected by the recent catastrophe, of his own volun-
after-thought, repeated instructions addressed a letter on the 30th of July to all
made, with the ob to the same effect as the King's note. This
by Mr. Hume for th not unimportant. Ever since the revolu-
into the Orange L and the expulsion of the elder branch of
Mr. Hume's opinion atholic church, and especially the high
day, when it was ag dignitaries of that church, have studiously kept themselves apart from the new dynasty, showing, not indeed an active hostility (which they dared not do), but a silent aversion to the present government. The Archbishop of Rouen has been the first to show symptoms of reconciliation and good will; other great churchmen have followed his example, and the crime of Fieschi has had the effect of somewhat uniting the church and state, which for five years had stood separate and diffident, in mutual ill-humour and suspicion. If we judge only of the population of Paris and the great cities, the whole matter will be indifferent enough; but in the southern and western provinces, in central France, and among the country people pretty generally there is still some religious feeling and a Catholic tendency more or less strong, and there are many men and more women who would never believe that Louis Philippe was their lawful king, as long as Monsieur le Curé asserted or implied that he was *not*. Therefore the circumstance *is* important, and we are not surprised to see all the government papers treat it as such.

On the 31st of July, seven young men who were all "ouvriers bijoutiers *en faux*," or, what we may call *journeymen Brummagem jewellers*, and all dressed à la Robespierre, attempted to get up an *émeute* by shouting "Down with Louis Philippe—Long live the Republic!" but with the recent tragedy in their minds, none were found to join this farce, and the working people of Paris assisted the gens-d'armes in seizing the rioters and conveying them to prison.

On the day after the explosion in the faubourg, the minister of justice ordered a series of arrests, and some few persons have been daily arrested on suspicion ever since. Among these we find scarcely an individual of any name or note. In a list before us, we see tailors, stone-cutters, weavers, lock-smiths, and rag-sellers, the most conspicuous man named being a certain Napoleon-Narcissus Rabouin, who is set down as a "rentier," or private gentleman living on his rents, a designation assumed by half the vagabonds of Paris who have no visible means of subsistence. A few students in law and medicine, appear however to have been seized since the list was drawn up, and a number of editors of newspapers and writers in the Carlist and Republican journals have been arrested, and their papers stopped. Co-temporary with these proceedings, the police visited all the shops in Paris where caricatures of the members of the royal family, the government and church, and obscene books were sold, and made a general seizure.

On the 4th of August, the president of the Council, the Duke de Broglie, proposed to the Chamber of Deputies a series of severe, and we must add, arbitrary laws, for the punishment and prevention of state crimes and attempts at revolution. The first class of these laws was directed wholly and solely against the press, of the dangerous fanaticism and profound immorality of which the Duke complained in strong terms, though he did not expressly identify any part of the press with Fieschi's attempt. M. Persil, the Minister of Justice, who followed the President, went farther than the Duke, declaring, that though the censorship, abolished for ever by the revolution of 1830, should not be re-established, nor so much as mentioned, yet "ministers wished to render a Republican and Carlist press *impossible;* for the existence of such a press was incompatible with the very principle of the government."

The following are some of the more important clauses of the tremendous bill, which tends to the annihilation of *all* free printing:—

"Art. 1. Any one found guilty of an offence against the person of the King by any mode of publication whatever, to be punished with imprisonment and fine of from 400*l.* to 2000*l.*

"2. For ridiculing the person or authority of the King, from six months to five years in prison—fine 20*l.* to 400*l.* The offender moreover to be deprived of the whole or part of the civil rights mentioned in article 42 of the Penal Code, for the entire duration of his penalty, and for a term equal to that of the imprisonment to which he may have been condemned.

"3. For mentioning or even ALLUDING to the NAME of the King in any disquisition upon the acts of government, imprisonment from one month to a year, and a fine of from 20*l.* to 200*l.*

"4. To reflect in writing upon the form and principle of the King's government, or to put forth any direct or indi-
